A Scottish Protection Association.—The annual meeting of the Scottish Electrical Manufacturers' and Factors' Association was held in Glasgow last month. The secretary reported an increase in the membership. A resolution was passed permitting the admission of all manufacturers, factors, and wholesalers, trading in or with Scotland, to an extent deemed sufficient by the Association. Mr. A. B. Ames (British Electrical & Manufacturing Co., Ltd.), was elected chairman, and Mr. J. F. Stevenson (Macintosh Cable Co., Ltd.), vice-chairman. The secretary is Mr. H. C. McMillan, 13, Dundas Street, Glasgow.

German Electrical Supplies for Uruguay.—The firm of Siemens-Schuckert has received permission to erect a large branch house and works at Montevideo under the name of Compañia Platense de Electricidad Siemens-Schückert. There is a scarcity of certain electrical supplies, the requirements of the State being unsatisfied. All purchases of electrical apparatus for the Government and private stations will continue to be effected by means of public tenders.—*Reuter's Trade Service* (Montevideo).

For Sale.—Mr. H. J. Shaw will sell by auction on February 18th, at 13, High Holborn, the stock of a wireless goods factor; Messrs. Fuller, Horsey, Sons & Cassell will offer by auction on March 2nd and following days, at the Cubitt Engineering Works, Aylesbury, Bucks., the entire contents of the works, comprising engineers' machine tools, motor-body building plant, electric power plant, stores, and material, &c.; the Secretary of the North of Scotland College of Agriculture, Aberdeen, invites offers for one 20-b.h.p. and one 15-b.h.p. electric motors. (See our advertisement pages to-day.)

Lighting and Power Notes.

Australia.—TASMANIA.—According to *Tenders*, a sum of £81,000 has been appropriated by the Tasmanian Parliament for extensions to the State hydro-electric system. Of this amount £50,000 will be expended on extending the supply to north and north-west coast towns, the completion of the purchase of the Davenport power station, £1,500; mains extensions, transformers, house service meters, &c., in connection with country retail services, £4,500; mains, transformers, house services, meters, and general extensions retail services, Hobart district, £25,000.

Barnstaple.—LOANS SANCTIONED.—The Town Council has received sanction to loans of £1,920 for mains and services, and £600 for meters.

Barry (Glam.).—ELECTRICITY SCHEME.—Specifications have been prepared for the cables and sub-station in connection with the Urban District Council's electricity scheme. A contract has been entered into between the Council and the South Wales Electrical Power Distribution Co., for a supply in bulk.

Bristol.—INQUIRY.—An inquiry was held at the Council House on January 26th by Col. T. C. Ekin, of the Electricity Commission, into the proposal of the Corporation to erect a new power station at Portishead. The Town Clerk, for the Corporation, stated that the plant at the Feeder Road works would shortly become insufficient, and it was necessary that additional plant should be available before the winter of 1927. Extension at Feeder Road was impracticable owing to water shortage, and in any case the extension would only postpone, at serious expense, the ultimate construction of a new station within a very short time. The scheme provided, as a first instalment, for plant with a capacity of 40,000 kW, and the estimated cost was £980,704, which included £246,204 for underground cables. Mr. Faraday Proctor, chief electrical engineer to the Corporation, stated that, except near Gloucester, there was no site other than that at Portishead. It was mentioned that the full scheme, if developed to 240,000 kW, would cost three millions. Mr. J. C. Peck (representative of the provisional contractors) said that there would be no question of nuisance from noise or vibration, and Mr. J. W. Gibson stated that the mechanical draught plant would obviate any risk of nuisance from dust or smoke. Mr. J. C. Glyde, clerk to the Portishead Council, said that every precaution should be taken with regard to noise, smoke, and dust, and that there should be as little depreciation of property as possible. The principal objection of Portishead with regard to boundaries was being negotiated. Objections were also raised by the National Citizens' Union and the Bristol Ratepayers' Association. The Commissioners will give their decision in due course.

China.—ELECTRICAL DEVELOPMENT.—In a recent issue of the Siemens *Zeitschrift*, Herr K. Mosig gives some particulars of the first high-pressure transmission installation in China. The power station is located on the Suchan River and near the Shanghai-Nanking railway. The initial plant comprises two 3,200-kW Zoelly-type turbo-generators running at 3,000 r.p.m., but it is intended later to install two 10,000-kW sets. The current is stepped up from 6,600 V to 33,000 V for transmission purposes to the towns of Shangschau and Wusie, a distance of 6¼ and 20 miles respectively, and is reduced at sub-stations first to 2,300 V and then to 380/220 V.

Chester.—LOANS.—The Town Council has approved of application being made for sanction to borrow £3,000 for the purpose of wiring small houses on the hire-purchase system, £3,970 for the purchase of transformers, £17,870 for the purpose of carrying out various works, and £12,000 for the purpose of replating the storage battery at New Crane Street.

Chesterfield.—NEW CONVERTER.—The Council proposes to borrow £5,500 for the erection of a 1,000-kW rotary converter at the electricity works in order to meet the estimated additional demand for electricity in the next three years.

Continental.—POLAND.—On the initiative of the Minister of Public Works, the National Economic Bank is discussing with the American and European Utilities Corporation the partial realisation of the electrification programme drawn up by the Minister of Public Works. A committee is at present studying the economic condition of the country to be electrified.—*Reuter* (Warsaw).

FRANCE.—The Compagnie d'Energie Electrique du Littoral Mediterranean has drawn up a scheme for the electrification of the villages and agricultural districts in the Vesubie valley of the Alpes Maritimes Department. The scheme includes the establishment of a 20,000-V transmission line between Saint Martin and Vesubie.

The Compagnie Electrique de la Loire et du Centre is replacing a 1,500-h.p. steam turbine which has been in use at its power station at Montlucon since 1907, with a modern one of 4,400 h.p. A new hydro-electric station of 14,000 h.p. capacity is also in course of construction at Monistrol d'Allier, and is expected to be completed by the end of the current year.

SPAIN.—The Sociedad Productores de Fuerzas Motrices, which is erecting a large hydro-electric station to utilise the Clede Falls at Pobla de Segur in the Pyrenees, is preparing plans for the transmission of the electricity generated to Barcelona. In order to ensure an uninterrupted supply, arrangements have been concluded with the Sociedad de Carbones de Berga which operates certain lignite mines near Barcelona, to establish a reserve steam-operated power plant in connection with its mines.

GERMANY.—A Berlin message states that the Swiss Government has approved the contract of the Swiss Power Transmission Co. and the Baden electrical undertakings for the mutual exchange of electrical energy.

Crowborough. — ELECTRICITY EXTENSIONS. — The Crowborough District Gas and Electricity Co. recently instructed its engineers, Messrs. A. Hugh Seabrook & Partners, to extend the plant at the generating station, and orders have been placed for a four-cycle oil engine and alternator, which it is expected will be available for service this month.

Croydon.—ELECTRICITY EXTENSIONS.—The electrical engineer has prepared a scheme for the development of the electricity undertaking at a total cost of £59,000.

LOANS SANCTIONED.—The Electricity Committee has received sanction to loans of £1,300 for buildings, £13,000 for mains, and £4,600 for plant and alterations to buildings.

MAINS EXTENSIONS.—The Committee has decided to extend mains at a cost of £3,350.

Darwen. — ELECTRICITY SUPPLY. — The Corporation has applied for sanction to extend its generating plant, but at the request of the Mid-Lancashire Electricity Advisory Board, has agreed to an interview with the Blackburn Corporation to ascertain whether an arrangement can be arrived at. The Electricity Commissioners have authorised the Council to borrow £40,000 for extensions to mains, services, &c.

Edinburgh.—DEPUTATION TO VISIT PARIS.—In connection with the extension of Portobello power station the Corporation Electricity Committee has recommended that a deputation of five members should be appointed to visit the Gennevilliers power station in Paris.

Gainsborough.—ELECTRICITY SCHEME.—Tenders for an electricity scheme are now before the Urban District Council, and it is hoped that a supply will be available by the winter of 1926.

Irish Free State.—WATERFORD SCHEME.—Opposition was made by the Chamber of Commerce and certain ratepayers at an inquiry held in the town, before an inspector of the Irish Free State Local Government Board, into the Corporation's application for a loan of £30,000 for an electricity scheme. The inspector declined to take evidence as to whether the scheme should or should not be adopted, holding that that had been decided by the granting of a Provisional Order. It appeared that a referendum of city householders gave a majority against the scheme, only four voting in favour. Alderman Keane, mayor, gave evidence in support of the scheme, pointing out that a considerable area of the city was not at present lighted. Testimony on behalf of the opposition was to the effect that the Corporation's proposals were uncommercial, and that the scheme would cost up to £50,000 to complete. The inspector's report will be presented to the Government in due course.

Japan.—ELECTRICAL DEVELOPMENT.—The Toho Denryoku's Nagoya steam power station of 25,000 kW has recently been completed, and good progress is being made with the construction of the Tsurumi station of 70,000 kW. The Tokyo Dento K.K. is to erect a power station of 150,000 kW imme-

diately on completion of one of 50,000 kW at Lenju. Concessions have now been issued for nearly all the important sites for hydro-electric development in the neighbourhood of the large cities, and future development may only be expected on the Shinano River, the Oi River, and Fuji River. On these rivers the power stations projected are all on a large scale, varying from 150,000 to 100,000 kW.

Lancaster.—EXTENSION OF SUPPLY.—The Corporation has decided to spend an additional £6,000 on a cable to supply the new garden city of Bowerham where over 100 houses are in course of erection.

Leeds.—EQUIPMENT OF SMALL HOUSES.—At a recent joint meeting of representatives of the Electricity, Gas and Improvements Committees of the City Council, authority was given for 34 houses on certain new Corporation estates to be equipped as all-electric and 34 to be equipped as all-gas.

Long Sutton.—ELECTRICITY SUPPLY.—The Urban District Council is to ask the Boston and District Electricity Supply Co., Ltd., whether it would be prepared to provide a supply of electricity for the town, and as an alternative endeavours are to be made to obtain a supply from King's Lynn and Wisbech.

Ludlow.—TRANSFER OF UNDERTAKING.—The Town Council has completed an agreement with the Ludlow Electric Light Co., under which the electricity undertaking is to be transferred to the Corporation on June 30th.

Luton.—LOAN SANCTIONED.—The Corporation Electricity Committee has received sanction to loans of £25,000 for mains and services, and £7,500 for sub-station equipment.

Maghull.—ELECTRICITY SCHEME.—At a recent meeting of the local Council it was decided to adopt a scheme of electric lighting. Mr. James Scott, of Bootle, electrical engineer to the West Lancashire Rural District Council, estimated the total expenditure at £12,000, and that electricity could be supplied for lighting at 9d. per kWh.

Marlborough.—STREET LIGHTING.—The Town Council has instructed Mr. G. W. Molle, of Messrs. A. Hugh Seabrook and Partners, to arrange for the changing over of the street lighting from gas to electricity.

Morecambe.—ELECTRICITY SUPPLY.—The borough electrical engineer, reporting to the Town Council on the progress of the scheme for a second cable from the source of supply at Lancaster, said that the situation was altered by the L.M. & S. Railway Co.'s negotiations with the Lancaster Corporation for a supply to its railway, Heysham Harbour and other works. He therefore submitted an amended scheme and estimate of £17,000, in which the Lancaster and Morecambe Corporations and the railway company are jointly interested. The scheme has been approved by the Electricity Committee, and the Corporation has been requested to give its sanction.

Price Reductions.—Reduction in the charges for electricity have been made or recommended in the following districts:—

LONDON.—*Westminster Electric Supply Corporation, Ltd.*—Lighting: For the first 4,000 kWh per annum, 5d. per kWh; all consumption in excess of this amount, 4d. per kWh. Heating, cooking, and motors: If taken through a separate meter, 1d. per kWh.

COVENTRY.—H.p. or bulk supply: The increase in the basic rate from 15 to 10 per cent. Power (l.p. supply) and heating: Flat rate from 1¼d. to 1½d. per kWh. Lighting: Maximum demand rate from 8d. to 7d. per kWh for the first hour per day, the second hour remaining at 3½d. per kWh, and thereafter from 1¼d. to 1½d. per kWh; flat rate from 4d. to 3¾d. per kWh.

CHISLEHURST.—*The Chislehurst Electric Supply Co., Ltd.*—The charge for electricity reduced by 1d. per kWh.

RUGBY.—Power: 1¾d. per kWh, with a minimum charge of 10s. per h.p. installed. The charge for h.p. supply has also been reduced.

New Zealand.—ELECTRICITY SCHEME.—The New Zealand Sounds Nitrates Syndicate has been granted a 60 years' licence by the Government to generate at Smith's Sound a force of 300,000 continuous h.p., 50,000 h.p. of which is to be developed within seven years, while the construction of works to generate the balance must be begun within 10 years. The Government retains the right to resume possession with compensation at the end of 30 years. The power produced is to be used for electrochemical, metallurgical, and other purposes. The rental payable to the Government is 1s. per annum per kW.—*Reuter's Trade Service* (Wellington).

Peak District.—ELECTRICITY SCHEME.—Although the matter of providing an electricity supply to a number of districts in the Peak District has been considered by various local authorities at the request of the South-East Lancashire Electricity Advisory Board, no definite steps have been taken by those bodies, and intimation has now been made by a private company that it intends to prepare a scheme for a supply which will link up Chapel-en-le-Frith, Whaley Bridge, Hayfield, and Chinley.

Peterborough.—LOAN.—The Town Council is applying for sanction to a loan of £10,420 for the following purposes:—H.p. and l.p. switchgear, £8,666; and a fifty-ton crane, £1,754.

Plymouth.—LOAN SANCTIONED.—The Corporation has received sanction to the borrowing of £12,017 in connection with electricity supply in the Lipson Vale and Laira districts.

MAINS EXTENSIONS.—The Electricity Committee has approved mains extensions involving an expenditure of £1,643.

Preston.—STREET LIGHTING.—The Corporation Electricity Committee has had under consideration alternative side-pole and central-suspension schemes of lighting for certain thoroughfares, and has recommended the Corporation to approve of the side-pole scheme at a cost of £1,080, with an annual running cost of £360 for 36 lamps.

NEW PLANT.—The Committee has received sanction to extend the power station by the installation of a third 12,500-kW turbo-generator and auxiliary plant.

LOAN.—Sanction has also been received to the borrowing of £20,000 for changing over in the Avenham and Deepdale districts, and for laying new feeder mains in other districts.

Rawtenstall.—CORRECTION.—In our last issue (p. 179) we stated that the Corporation had received permission to increase the plant at its electricity works to reach 6,000 kW. The plant capacity is already nearly 15,000 kW (which is the largest capacity per inhabitant of any town in the United Kingdom); the proposal is to increase the capacity *by* a 6,000/7,500-kW set.

Shoeburyness.—ELECTRICITY SUPPLY.—The Urban District Council has instructed its Parliamentary agents and engineers to prepare an electricity scheme and draft Order for submission to the Electricity Commissioners. Negotiations are in progress with the War Department for a supply in bulk to the Council.

Special Orders.—Application has been made to the Electricity Commissioners for Special Orders by the following authorities:—The Urban District Council of Seaham Harbour for the supply of electricity in the urban district and in the parish of Seaham; the Borden and District Gas Co., to supply in certain parishes in the rural districts of Alton, Petersfield, and Midhurst; and the Llandilofawr Rural District Council in the parish of Llandybie.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising Messrs. Crompton & Co., Ltd., to supply electricity in the urban district of Wellington.

Stoke.—LOAN SANCTIONED.—The Corporation Electricity Committee has received sanction to the borrowing of £5,500 for mains in connection with the supply of electricity in the Hanley area.

The Fylde.—ELECTRICITY SUPPLY.—A meeting of local authorities, on January 21st, considered a proposed electricity scheme for the Fylde district. The meeting decided to obtain the advice of an electrical engineer as to whether a scheme could be formulated for the joint townships to supply electricity directly without vesting the Preston Corporation with full control.

Tynemouth.—LOAN.—The Electricity Committee is applying for sanction to a loan of £16,000 for the electricity undertaking.

Walton-on-Thames.—PURCHASE OF UNDERTAKING.—The Urban District Council, on January 18th, decided to give notice of its intention to purchase the local electricity undertaking of the Urban Electric Supply Co., Ltd., at a cost estimated at £90,000.

Wrexham.—ELECTRICITY SUPPLY.—The Town Council has adopted a scheme for laying new a.c. underground distributors at an estimated cost of £12,000.

Tramway and Railway Notes.

Bradford.—TRAMWAY IMPROVEMENTS.—The Estimates Sub-Committee has approved the Tramways Committee's scheme for the reconstruction of tramway track as follows:—Manningham Lane, North Parade to Oak Lane, £27,715; Barkerend Road, Otley Road to Byron Street, £14,740; Rushton Road to Leeds Road, £8,262; and also for the purchase of ten motor 'buses (£11,834) and six railless cars (£8,925).

Continental.—POLAND.—The tramway workers in Warsaw struck work on January 28th. According to *The Times*, the dispute was the result of the men's demand for increased wages.

East Ham.—RAILLESS-CAR SCHEME REJECTED.—In connection with the Borough Council's proposal to promote a Parliamentary Bill for the substitution of railless cars on one of the routes of its present tramway system, and to extend the railless-car service in other directions, a poll of ratepayers taken on January 26th resulted in a large majority against the proposal. The cost of the scheme was estimated at more than £150,000.

Huddersfield.—TRACK RENEWALS.—The Tramways Committee has considered a report from the borough engineer on the condition of the tramway track, and has decided to reconstruct the following sections in the order named:—Apsley section, from Shore Head to Somerset Road; Newsome section, from Chapel Hill to Bridge Street (with an additional loop); Northumberland Street, Northgate to John William Street, outward track; Birkby section, from John William Street to Wheathouse Road; Manchester Road, from Longroyd Bridge (River Bridge) to Griffin Inn.

(*Continued on page 223*)

An Electrical-Instrument Works.

A Visit to the Works of Messrs. Nalder Bros. & Thompson, Ltd.

The firm of Nalder Bros. & Thompson, Ltd., whose works are now established at Dalston, was commenced in 1884 by Messrs. F. H. Nalder and H. Nalder,

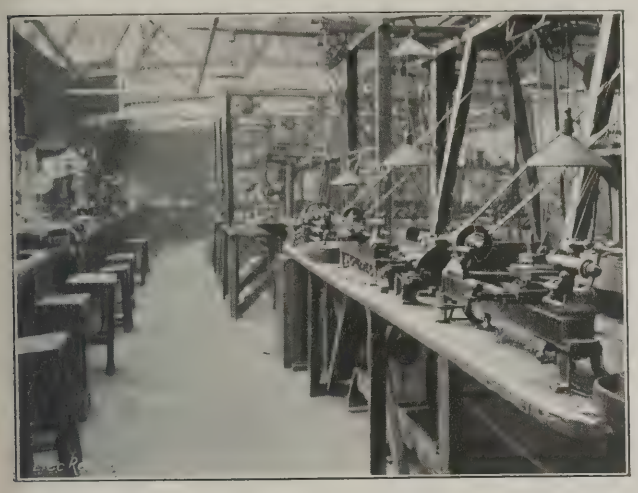

Fig. 1.—Major-Assembly Shop

under the style of Nalder Bros., with its headquarters at Westminster and a small works at Brentford. It soon became necessary to seek larger works, and in early 1887 the factory was moved from Brentford to Westminster, about which time a partnership was taken in the concern by Mr. C. W. S. Crawley, and business was carried on under the name of Nalder Bros. & Co. Soon afterwards the firm was joined by Mr. Alfred Soames, and in 1890 its continued progress necessitated another move, new works being established at Clerkenwell. In 1896 it was decided to split the business, due primarily to the ammeter and voltmeter business having increased to such an extent that it had become advisable to departmentalise the production. Mr. F. H. Nalder purchased the goodwill and plant of the ammeter, voltmeter, and switchboard department, remaining a partner in the parent firm until 1897, and was joined in the fresh enterprise by Mr. E. Thompson. The new firm was established under the name of Nalder Bros. and Thompson, with its works at Queen Street. The undertaking was converted into a private limited company in 1899 with Mr. F. H. Nalder as chairman and managing director, which position he has continued to hold to the present day. Additional works were taken over at Kingsland Green, Dalston, and in 1914 the concern moved entirely to Dalston, other premises at the present headquarters, Dalston Lane, being equipped as a modern factory. The two last-mentioned premises in which, by the courtesy of the management and staff of the firm, we recently spent a particularly interesting day, accommodate the undertaking entirely. The products of the firm now include practically every kind of instrument and apparatus required for use in connection with the modern operating switchboard.

Fig. 2.—New Assembling Wing.

The Dalston-Lane works is devoted to the winding of the instrument coils, the assembling of all instruments and the smaller relays, the manufacture of small instrument parts, such as pivots, pointers, &c., and the testing and general finishing processes such as enamelling. The top or third floor is where practically all the instrument assembling is carried out by mechanics specialised in particular operations. A new wing to this floor, fig. 2, serves as a well-lit modernly-constructed instrument shop. It is of long and narrow construction, with the benches arranged so as to receive a maximum of natural light. The various movements, coils, coil supports, magnets, and the many other delicate parts are built up in this portion of the works. Some of the most interesting operations are the assembling of pivots, pointers, and control springs. Of outstanding interest in the work here is the assembly of the dynamometer instruments, in which a special construction of movement support is used, affording, it is claimed, a high resistance against eddy currents, &c. The work is arranged sectionally, so that each type of instrument receives entirely separate and individual attention. In the large adjoining room, fig. 1, the major parts are assembled in the cases before the movements are fitted. It is interesting to note that all sizes of instruments, varying from those with 22-in. scales down to small pocket instruments, are dealt with in the same shop. One of the most interesting

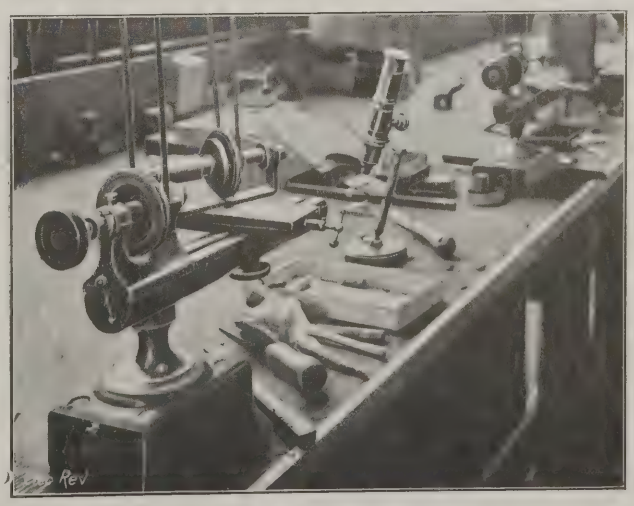

Fig. 3.—Special Pivot Grinders.

operations here is the grinding of the very small hardened-steel pivots required for many of the movements. This is done on special grinding machines,

fig. 3, designed by Messrs. Nalder Bros. & Thompson. Both the grinding wheel and the spindle are revolved in separate containers at a convenient angle of relation, the necessary observation of the point of operation being made under a microscope. These machines are

Fig. 4.—Coil-Winding Machines.

belt driven from overhead shafting. A stamped flange, which is screwed on a special lathe and receives the pivot, is clamped to the movement.

The central floor of these premises accommodates the winding, enamelling, and junior assembling de-

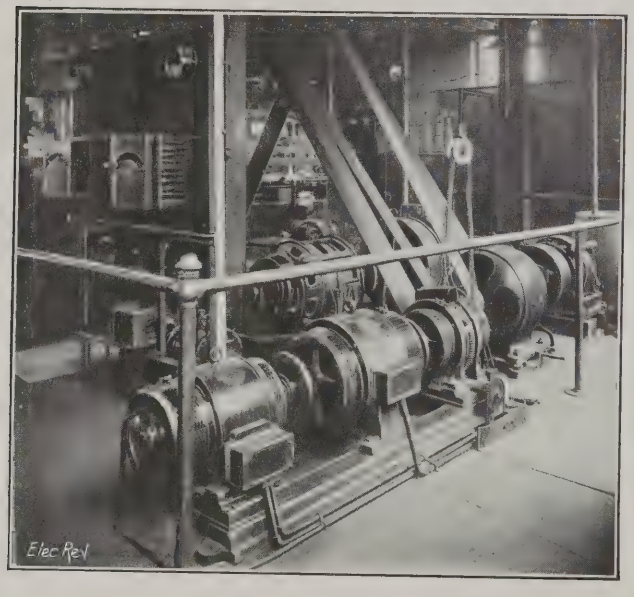

Fig. 5.—Testing Machines.

partments. Small coil-winding machines, fig. 4, driven by fractional-h.p. motors, deal with the fine-wire coils; counting gears are coupled to the spindles on which the coils are revolved. A machine for winding precision transformers with jointless-iron ring cores is a somewhat novel installation in this section. The transformer core and the "winding-off" bobbin are so revolved that one side of the continuous frame core only is wound. A compound-forcing plant is another feature: This treats coils intended for tropical countries, forcing compound between the layers and individual coils to increase the insulation and give protection against the entrance of ants. Two tanks, one vacuum and one compound, are provided; the coil, after being dried, is subjected to the hot compound under a pressure of 80 lb. per sq. in. A small winding room in which formerless coils are wound on special winding tools forms an additional portion of this department.

In any electrical instrument works the outstanding feature is undoubtedly the testing department, at any rate from the point of view of outside interest. The ground floor at the Dalton-Lane works accommodates the plant and apparatus required in this direction. It is here that the shaped tungsten-steel pieces from Kingsland Green are magnetised in coils carrying up to 1,000 A, according to the size and intensity of the magnet required. The magnets are aged by a similar method employing a.c. Sample magnets are periodically selected and kept for years under observation and test. The testing racks, which are arranged down each side of the test house, are equipped with standard cells and instruments, potentiometers and the usual testing apparatus for the calibration and standardisation of electrical instruments. A number of Kelvin balances, Siemens dynamometers, and Nalder potentiometers are used as standards, while a Crompton potentiometer provided with varying shunts of capacities up to 600 A is employed as a master standard. Tudor batteries are installed under the testing benches to provide the necessary supply for the d.c. work. The largest of these consists of six cells, each of 1,000-Ah capacity at 2 V. For the a.c. work a number of machines convert a 3-wire d.c. supply from the Hackney Electricity Department. A single-phase, 13-kW alternator supplies any frequency from 25 to 100 cycles per second to each rack by means of a series-parallel control of its field. Two small generator sets, 300 A, 15 V, are used for charging the batteries, and a 150-V generator is used for charging the special batteries for the voltmeter testing racks. A most interesting feature of the testing plant is a tandem combination, fig. 5, used to supply 3-phase energy for the calibration, &c., of power factor meters. It consists of a d.c. motor direct coupled to two alternators, one supplying current and the other creating

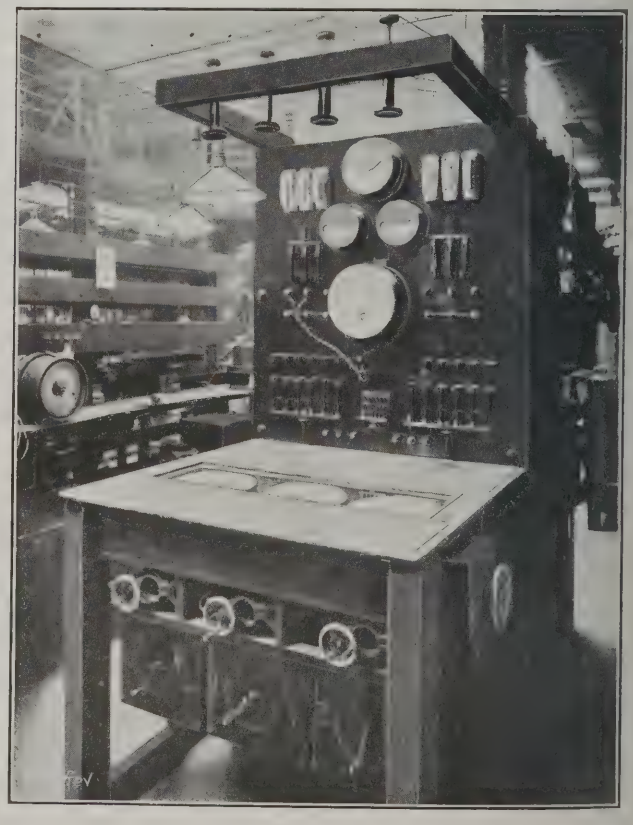

Fig. 6.—Three-Phase Testing Board.

the necessary potential difference. Both the rotors are fed from the same d.c. supply. The pressure machine has a movable stator, by means of which any phase relationship up to a total displacement of 360 deg. can be obtained. By regulating the speed of the

d.c. machine any frequency from 18 to 60 cycles per second can be obtained on the a.c. units. Each phase on the current alternator is wound with two coils, the ends of which are brought out separately to a special switchboard, fig. 6, equipped with 6-pole, 2-way switches arranged so as to give either series or parallel connections between the coils for either a star- or delta-connected 3-phase supply. The load on the machine is adjusted by means of a water resistance, which may be connected in star if desired. The stator of the pressure machine is revolved by a chain gear operated from the control board. Another machine used for the same purpose consists of a similar combination arranged vertically. A particularly interesting operation is the calibration of frequency meters. The supply frequency is calculated from the speed and design data of the machine supplying the apparatus under test; the machine speed is ascertained to a fine degree of accuracy by means of a stroboscope, the revolving disk being attached to the shaft of the supply machine. Rotary synchroscopes of the "Nalder-Lipman" pattern are tested under working conditions in conjunction with two alternators.

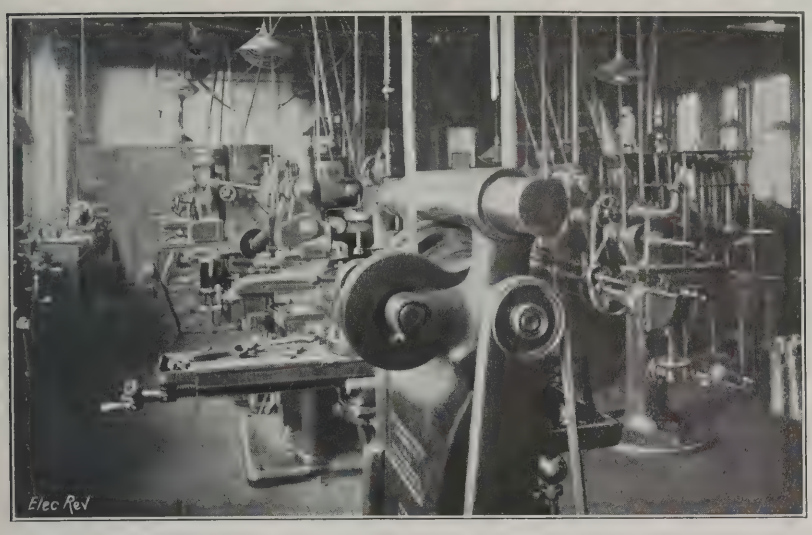

Fig. 7.—General Machine Shop.

An important and interesting section of the test room is the high-pressure section, where there is a number of "step-up" transformers of various ratings. The largest of these is a single-phase transformer of Messrs. Nalder Bros. and Thompson's own design and construction, having a maximum ratio of 110/160,000 volts, and its l.p. and h.p. windings arranged in sections, which may be readily connected in series or parallel according to the range desired, the pressure being adjusted by means of a choking coil in the l.p. circuit.

The Kingsland Green factory deals with the heavier operations necessary in the manufacture of electrical instruments and the complete manufacture of circuit breakers and heavy-current relays. On the ground floor are received the rough castings for the instrument cases and covers, which are dealt with on grinding and polishing machines. An interesting feature of this section is the shaping and hardening of the permanent magnets required for the various instruments, prior to their magnetisation in the other works. The first floor at Kingsland Green accommodates the machine shop. Here are capstan and automatic lathes, and turning, boring and milling machines of varying descriptions. Some of the automatic machines are engaged in making the very small screws, bolts, and nuts required for the instrument connections. Electric furnaces are installed for the softening of small cast-steel bars. Of particular interest in this department is the preparation of small aluminium formers required for some of the fine-wire coils for instruments and relays, &c. From stamped disks are punched cylindrical cups, reducing them to the required size in a series of operations. On a small hand-driven roller machine of the firm's own design is cut a collar of given width, and the edges of this are turned out to form small containing lips. The product is then mounted on a small expanding-core machine to receive its final shape. Shaping machines on which the metal chambers and plungers for instrument-damping apparatus are prepared, constitute another feature.

A part of the second floor is devoted to tool making; a large number of special shaping, cutting and stamping tools, used in making the ever-varying designs of instrument parts, are continually being manufactured. Some special automatic gear-cutting machines are engaged in cutting the teeth for the clock wheels required for recording instruments and time relays, &c., and also for clutches used in the generator-turning gears of testing apparatus, &c.

Fig. 7 shows a part of the general machine shop on this floor, and fig. 8 is a view of the assembly shop for the sensitive and delicate control coils for a variety of relays for definite- and inverse-time operations. The relay department is fully equipped for the manufacture and assembly of the necessary time pieces. Of particular interest in this direction is the construction of minute governors used for the speed control of the time-regulation apparatus on some of the time relays. These perfectly-constructed devices are provided with balls and straps and are hand assembled.

A third floor is equipped with some miscellaneous machinery not without interest. An engraving machine deals with the scale plates, &c., of instruments intended for use in tropical countries. The engraving is filled in with wax, after which the scales are treated in the plating department on the next or top floor, which is equipped with apparatus for nickel, copper, silver and gold finishing. The latter treatment is given to the "tropical" instruments, and the silver process is used for the fine contacts of relays, &c. It was encouraging to note at the time of our visit that the departments were fully employed, and that optimism prevailed among the staff and workpeople.

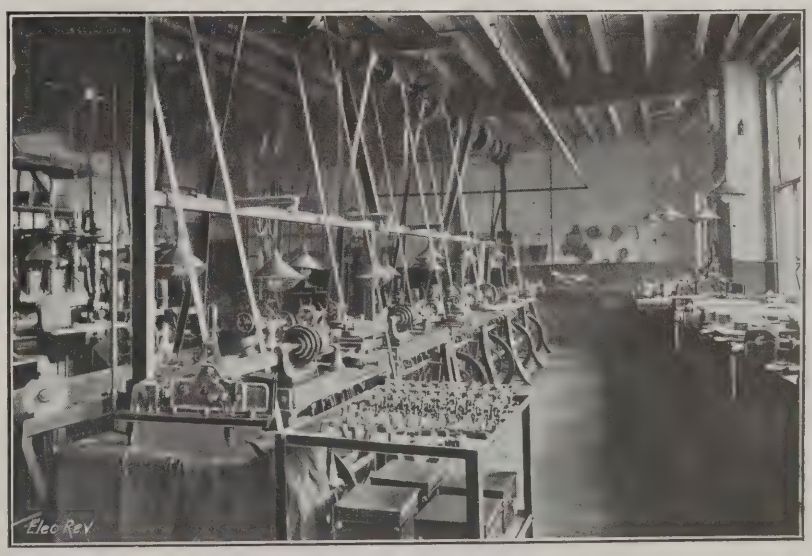

Fig. 8.—Relay-Assembly Shop.

The Birmingham Broadcasting Station.

The New Studio and Relay Automatic Telephones.

The new studio which the British Broadcasting Co., Ltd., has provided at its Birmingham radio-telephone broadcasting station, besides being the largest in this country, is of interest on account of the improvement that has been adopted for controlling echo effects. In contrast to the old method of completely draping the room so as to eliminate all echo, fig. 1 shows that one of the chief features of 5IT's new studio is ample window space, which should incidentally facilitate natural lighting and ventilation. A certain amount of echo, regulated to suit the kind of music being played, enhances the quality of transmission, and accordingly the draping has been hung on pulleys so that it may be varied at will. The area of the main studio is some 2,000 sq. ft., and since the opening of the new studio on January 20th the new control arrangements have effected quite an appreciable improvement in the quality of transmission. This is true especially of what may be termed the heavier types of transmission, in which the microphone has to deal with a volume of sound made up of many widely differing parts. The exceptionally wide floor space in the main studio has enabled a more effective distribution of the parts of a band, or choir, to be made; but as was to be expected, the large studio has been found not so suitable for speech and solo musical items as the smaller studio, from which most of the talks and some of the lighter music will be transmitted.

It is also of interest to note that the new studio and

Fig. 1.—A Corner of the Main Studio at Birmingham.

Fig. 2.—Relay Automatic Telephone Exchange at "5 I T".

office accommodation has been equipped with a Relay automatic telephone branch exchange of the latest type, as shown in fig. 2. The installation, which is initially one of 30 lines, is constructed on the expanding bookcase principle, so that additional units can be added as required. The exchange not only interconnects every department of the building, but it also establishes communication with the manual switchboard for outgoing and incoming public exchange calls. With this Relay combination service, only one telephone is used to get the automatic internal calls as well as the ordinary Post Office calls, and gives a continuous day and night automatic service throughout the Birmingham station. The Relay Co. has also received a requisition for a similar installation at the B.B. Co.'s Cardiff station.

Fig. 3.—Part of the Broadcasting Control Room.

Tramway and Railway Notes.

(*Continued from page 218.*)

Irish Free State.—DUBLIN.—According to the *Daily Telegraph*, the Dublin Borough Commissioners have sanctioned an agreement under which, in consideration of the Corporation undertaking not to exercise for 42 years its right to purchase the city portion of the Dublin United Tramways, the latter company will take over and work the Dublin and Lucan Electric Railway.

London.—MORDEN TUBE EXTENSION.—The Underground Company has placed contracts for the construction of South Wimbledon station and Collier's Wood station on the new Morden Tube extension. Of the seven stations on the line, six are now in course of erection, and it is anticipated that the line will be ready for traffic in the summer. Work has also commenced in the construction of the Tooting Broadway, Balham and Trinity Road stations, and they are scheduled to be completed in five months' time. Good progress is being made with the rest of the work. About 25 per cent. of the permanent way has been laid and the installation of signals, &c., is now in hand.

LOTS ROAD STATION.—Work is in hand to enable the Central London Tube, now dependent upon the Wood Lane power station for most of its supply of energy, to be fed entirely from the power house at Lots Road, Chelsea. The existing steam plant at Wood Lane is now obsolete and inefficient. Cables from the Lots Road station have been laid already, and in view of the different voltage of the h.p. supply on the Central London Railway, a transforming station is being installed in the Wood Lane power house, which will thus become a distributing centre for the railway. Additional plant also is being installed at Lots Road to provide for the further demand which will be made upon its output by the Central London Railway and other increased services and extensions.

TOTTENHAM COURT ROAD STATION.—The merging of the Central London and Hampstead line stations at Tottenham Court Road is approaching completion. The escalator equipment, part of which was put into service a month or so ago, has been completed, and was put in operation on February 1st. The work of demolishing the eight lifts which have hitherto served the station and the construction of the new entrance and subway leading from the site of the Central London station will not be completed until April 1st. The concourse at the foot of the main escalator, which includes the whole of the space formerly occupied by the four lifts, will, when completed, be the largest in London, providing ample accommodation for the traffic to be dealt with. The number of trains to be operated through the four platforms at Tottenham Court Road will be 1,804 per day. The cost of the improvements will exceed £100,000.

Lytham-St. Annes.—SERVICE TO BE DISCONTINUED.—The Corporation Tramways Committee has recommended the Town Council to discontinue the tramway service between Lytham Square and the hospital, and substitute motor coaches.

Newcastle-on-Tyne.—PURCHASE SCHEME REJECTED.—In connection with the Corporation's decision to purchase the Tyneside Tramways and Tramroads Co.'s undertaking for £118,000, this and other proposals were submitted to a town's meeting, and the result being unsatisfactory, a poll of the citizens was taken, which resulted in the rejection of the proposed purchase.

Telegraph and Telephone Notes.

Argentina.—TELEPHONE SERVICE.—Direct telephone communication between Bahia Blanca and Buenos Aires has lately been established. The service is a source of great satisfaction to all commercial houses, and has already proved a great saver in time.

Japan.—AUTOMATIC TELEPHONY.—The restoration of the Tokio telephone service, which was destroyed by the earthquake and fire of 1923, should be completed at the close of the financial year 1926, by which time Tokio should possess nine automatic exchanges accommodating some 36,000 lines, in addition to manual exchanges with a further 46,000 lines. The automatic equipment is being made in this country by the Automatic Telephone Manufacturing Co., of Liverpool, and will be installed by it. The associated manual equipment is being made by the Standard Telephones and Cables, Ltd., of London. Japan has followed England's lead and has adopted the Strowger director system.

Marine Radio Operators.—STRIKE SETTLEMENT TERMS.—The Ministry of Labour stated on January 28th that it had obtained from the employers proposed terms of settlement of the strike of seagoing wireless operators, and had submitted them to the Association of Wireless and Cable Telegraphists, which was considering them.

Poland.—STRIKE.—The State telegraph and telephone operators at Warsaw struck work on January 26th, demanding the reinstatement of an employé. According to *The Times*, the telephone administration declares that the non-resumption of work will be treated as a dissolution of the working contract, and that no member of the staff will be re-engaged. A *Reuter* message, dated January 28th, stated that the efforts of the Minister of Labour to mediate between the strikers and the Administration had been unsuccessful.

STATE TELEPHONE SERVICE.—Owing to the prolonged dispute between the employés and the Warsaw Telephone Co., the Government has decided to enforce the law enabling the State to take over the administration of public utility services. The Minister of the Interior has, therefore, appointed M. Urbanowicz, a lawyer, administrator for the Telephone Co., in order to assure a normal service and safeguard the interests of the shareholders and the workers. The Government has also decided to appoint a commission composed of representatives of the Ministries of Justice, Industry, and Labour, to apportion responsibility for the dislocation of the service and to settle all differences. The telephone service will be restored at once. —*Reuter* (Warsaw).

Rugby Radio Station.—PUBLIC SERVICE.—It is announced by the Post Office that on and from January 30th radiotelegrams will be accepted at any postal telegraph office for transmission to ships *via* the new wireless station at Rugby, which will enable a direct service to be offered to ocean liners and other ships fitted with continuous-wave receiving apparatus at any point on the high seas, however remote. Rugby will send daily to ships out of range of the British stations by which the regular ship and shore service is conducted, a list of the ships for which messages are in hand, indicating the order in which they will be sent. The rate will be 1s. 6d. per word.

Ship-Shore Radio Telephony.—G.W.R. TESTS.—Mr. D. B. S. Shannon recently tested what he claims to be improved apparatus for communicating by radio-telephony between a ship at sea and the shore without the use of either aerial or earth connection. The experiments were made on board one of the Great Western Railway Co.'s Channel Islands steamers; an ordinary telephone instrument was used in connection with a portable radio transmitter, and conversation is stated to have been clear over distances of from 10 to 70 miles. The ship's radio operator was able to transmit two messages with the ship's apparatus simultaneously without interference. This duplex outfit is said to consist of a 3-valve receiver and 2-valve transmitter, which can be combined in one case. The device is claimed to be specially suitable for aircraft.

Radio Notes.

Austria.—NEW STATION.—The President of the Austrian Republic, M. Hainische, inaugurated the new broadcasting station at Rosen Huegel, near Vienna, on January 30th; it is said to be one of the most powerful in Europe, and is operating on a wave-length of 500 metres.

According to *The Times*, a wave-length has been apportioned to the new station for the time being only, and is liable to be altered when the International Union at Geneva is ready to allocate new wave-lengths. In any event Vienna may possibly broadcast for some weeks to come simultaneously on two wave-lengths.

Broadcasting Committee.—FINAL PUBLIC SESSION.—The Government's Select Committee on Broadcasting held its final public session for the hearing of evidence this week in London.

Ceylon.—NEW STATION.—New transmitting plant designed for both ship to shore commercial work on i.c.w. and c.w. and broadcasting was inaugurated in December by the Governor of the island. The plant was designed by the chief engineer of the Post Office (Mr. E. Harper, M.I.E.E.) and erected by the Department. The power in the oscillatory circuit for broadcasting is 1 kW, which can be increased later as required. Excellent reports regarding the transmission have been received from places as far distant as Calcutta, India, approximately 1,000 miles distant. The broadcasting service in Ceylon is conducted by the Post and Telegraph Department.

Chile.—TWO NEW STATIONS.—The Chilean Government has granted a concession to the Compania Radio Chilena, of 30 years' duration, in conformity with the stipulations of the electric service law, and the company is therefore obliged to install two retransmitting stations in the zones which the Department of Electric Services indicates. One will be located in Concepcion, about 220 miles in a direct line south of Santiago. The entire system must be in operation by June, 1926, says *Commerce Reports*. The station at Santiago, which is to be rated at 1,500 watts, will broadcast on a 480-metre wave-length and will have the call letters CMAB. It will be permitted to broadcast four hours daily. It has been estimated that there are now 25,000 receiving sets in use throughout the Republic.

Holland. — WIRE RELAYS. — The Hague Town Council accepted on February 1st, says *The Times*, the proposal to use the ordinary telephone service as a means of broadcasting, as outlined in this column last week.

International Long-distance Tests.—TRANSATLANTIC EXPERIMENTS.—The week of international radio-telephone tests which have been conducted between England and the European Continent, on the one hand, and North and South America, on the other, do not seem to have been as successful as was expected. The pre-arranged schedule of transmission announced by the International Radiophony Bureau at Geneva was an indication of the international co-operation that has been reached, and amateur reception was relied upon to a large extent. Unfortunately, however, S.O.S. calls from ships

at sea silenced American Atlantic coast stations on two nights, while atmospherics, the Aurora Borealis (seen in France and Norway, which interfered with telegraph communication in Scandinavia) and sun spots have all been blamed. Reports from the U.S.A. indicate that experimenters seem to think that European broadcasting stations are not sufficiently powerful for more than fragmentary reception across the Atlantic Ocean. Although useful in their way, the tests serve to emphasise the fact that long-distance broadcasting is as yet unattainable as a means of entertainment.

Japan.—Stations.—According to a report by the Director of the Japanese Bureau of Telegraphs in Tokio, there are now three broadcasting stations in operation in Japan, *viz.*, at Tokio (call signal JOAK, wave-length 375 metres), Osaka (JOBK, 385 metres), and at Nagoya (JOCK, 360 metres). An experimental broadcasting station (JQOK) has also lately been established at Dairen, in Corea.

Paraguay.—Broadcasting Station Site.—A site has been awarded in the centre of Asuncion on which it is proposed to construct a large broadcasting station. The construction will be under the control of the Ministry of War and Marine, which will purchase equipment by means of public tenders. The opportunity will be taken to organise a broadcasting company under the management of the Municipality of Asuncion.—*Reuter's Trade Service* (Asuncion).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia. — Melbourne. — March 8th. City Council. Totally-enclosed armoured-type switchgear. April 27th. 2,000-kW rotary converter, and switchgear with accessories, and a.c. control gear. Specifications from City Electrical Engineer's Office.

Sydney.—February 10th. New South Wales Government Railways. 100 40-h.p. traction motors; March 3rd, 101 electric car equipments, consisting of motors, control equipments, air compressors, pantographs, &c.; April 14th, one 5-ton fixed electric crane. Forms of tender from Chief Mechanical Engineer, Wilson Street, Redfern, Sydney.

February 17th. 1,500-V, d.c. switchgear for St. Leonards and Hornsby sub-stations; March 3rd, 11,000-V ironclad switchgear for St. Leonards sub-station; March 10th, stokers or pulverised fuel equipment for three water-tube boilers for White Bay power house. Specifications from Chief Electrical Engineer, 61, Hunter Street, Sydney.

Municipal Council. February 15th. Twenty transformer tanks. February 8th. L.p. cables. Specifications from the Construction Engineer, Electricity Department, Town Hall, Sydney.

March 2nd. Australian Gas Light Co. One 750-kW turbo-generating set. Specifications from the Engineer, Parker Street, Haymarket, Sydney.

Aylesbury.—February 16th. Electricity Department. Overhead 11,000-V transmission lines and cables. (January 22nd.)

Bedwas.—February 11th. Bedwas and Machen U.D.C. Electricity Department. H.p. transmission line, l.p. distribution. h.p. and l.p. switchgear and static transformers. (January 29th.)

Belfast. — February 20th. Electricity Department. Twelve months' supply of stores, &c., including electrical accessories, lamps, carbon brushes, electricity meters, &c. (January 29th.)

Cardiff. — February 22nd. Electricity Department. Twelve months' supply of paper-insulated cables, one 1,500-kW rotary converter, and one 2,000-kW ditto.

March 8th. One 10,000-kW turbo-alternator and condensing plant. (See this issue.)

Chesterfield.—February 13th. Electricity Department. One 1,000-kW rotary converter equipment. (January 29th.)

Clitheroe.—February 23rd. Corporation. Transformers, switchgear, and cable connections for sub-station; e.h.p. and l.p. cables, boxes, &c. (January 15th.)

Edinburgh.—March 8th. Electricity Supply Department. One 25,000-kW turbo-alternator with condensing plant, or, alternatively, one 20,000-kW turbo-alternator with condensing plant. (See this issue.)

Faversham.—February 12th. Electricity Department. Cables. (January 29th.)

Halifax.—February 20th. Markets and Parks Committee. Electrical engineering work in connection with the erection of the public abattoirs. Particulars from Borough Engineer, Crossley Street.

Hull.—February 15th. Tramways Committee. Stores required during year ending March 31st, 1927, including car-lighting fittings, lamps, cable, and switches. Form of tender, &c., from General Manager, Tramways Offices, Albion Street, Hull.

Kilmarnock. — Ayrshire Electricity Board. Supply, delivery, and laying of h.p. cables and ducts in the Burghs of Ayr and Prestwick, also transformer kiosks and section pillars. (January 22nd.)

London.—Hammersmith.—February 10th. Electricity Department. Stores for 12 months, including electric light sundries, insulated wire, joint boxes, meters, l.p. cables, &c. (January 22nd.)

Islington.—February 8th. Electricity Department. One 10,000-kW, 3-phase turbo-alternator, condensing plant, condensate, circulating, exhaust, steam and water pipes, &c. (January 22nd.)

Metropolitan Water Board.—February 8th. 12 months' supply of electric lamps. Forms of tender from the Chief Engineer, 173, Rosebery Avenue, E.C.1.

London County Council.—February 22nd. H.p. switchgear for Lewisham tramway sub-station. (January 22nd.)

St. Pancras.—March 2nd. Electricity Department. E.h.p. switchgear at the Grafton Road sub-station. (See this issue.)

Manchester.—February 16th. Tramways Committee. Permanent-way points, tongues and crossings and general stores. Schedules from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly.

Newark-upon-Trent.—February 10th. Electricity Department. E.h.p., medium, and l.p. mains and distribution network, with street-lighting mains and accessories, single- and three-phase house-service pattern meters, two 250-kVA transformers, e.h.p., 11,000-V switchgear. (January 22nd.)

March 1st. Corporation. Two electrically-driven centrifugal pumps. (See this issue.)

New Zealand.—Wellington.—Public Works Department. April 6th. Storage battery, motor generator, and switchboard for the Penrose sub-station.*

March 23rd. Five oil filters, 5 oil-testing equipments, and 5 filter-paper drying ovens.* 22,000-V switchgear and equipment for Penrose sub-station.*

Northern Ireland.—Belfast.—February 8th. London, Midland & Scottish Railway Co. (Northern Counties Committee, Ireland). Stores required during 12 months. Particulars from Mr. F. J. Martin, Stores Superintendent, York Road station, Belfast.

Perth.—February 17th. Corporation. Electric lighting installation at 84 houses. Plans from Burgh Surveyor.

Plymouth. — February 17th. Electricity Department. Twelve months' supply of electricity meters, cables and transformers. (January 29th.)

Retford.—February 19th. East Retford Gas, Water and Electricity Department. Electricity generating plant, mains, transformers, and meters. (January 22nd.)

Salford.—February 18th. Electricity Department. Coal supplies required during six months commencing March 1st, 1926. Particulars from Borough Electrical Engineer, Frederick Road, Salford.

South Africa.—Johannesburg.—February 25th. Municipal Council. Four d.c. switchgear panels and 3-phase, truck-type ironclad switchgear panels.*

February 25th. S.A. Railways and Harbours. Two 4-ton electrically-driven fixed wharf cranes for Luderitz jetty.*

One 7-ton and five 4-ton electrically-driven portal cranes, complete.*

Pretoria.—February 25th. Postmaster-General's Department. Supply of a manual telephone exchange for Hatfield, Pretoria. Controller of P.O. Stores, Pretoria.

February 25th. Union Tender Board. Miscellaneous telegraph and telephone materials (C×1880).*

Spain.—Ministro de Fomento. Four electric cranes for the port of Gijon Musel. Particulars from Ilmo. Señor Presidente de la Junta de Obras del Puerto de Gijon.—*Reuter's Trade Service* (Madrid).

Stockton-on-Tees and Thornaby.—February 6th. Joint Tramways Committee. Pinions, axle boxes, &c. Particulars from General Manager, Bridge Road offices, Stockton-on-Tees.

Sutton Coldfield.—February 17th. Electricity Department. E.h.p. underground main, rotary converting plant and switchgear and automatic rotary converting plant and switchgear, or mercury-arc rectifiers. (See this issue.)

Watford.—February 23rd. Board of Guardians. Electric lighting installation, consisting of wiring old buildings, new power mains, motors, main switchboard, &c. Specifications from the Master's office, 60, Vicarage Road, Watford, or from the consulting engineer, Mr. W. M. Benny, 39, Carlton Road, Putney, S.W.15.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Admiralty.—
Gasfilled and vacuum lamps.—Edison Swan Electric Co., Ltd.; and Metro-Vick Supplies, Ltd.

Barking Town.—Electricity Committee. Accepted:—
Crane at transformer house (£117).—Herbert Morriss, Ltd.

Brighton.—Lighting Committee. Accepted:—
Cast-iron tubes and specials for condensing system at Southwick (£790).—Stanton Ironworks, Ltd.
Cable (£4,695).—Macintosh Cable Co., Ltd.
Steel bar work for coal plant (£566).—Indented Bar & Concrete Engineering Co., Ltd.
80-h.p. motor (£340).—Metropolitan-Vickers Electrical Co., Ltd.
Circulating pump (£288).—W. H. Allen, Sons & Co., Ltd.
Switchgear (£74).—Brookhirst Switchgear, Ltd.
Reconditioning battery (£222).—Tudor Accumulator Co., Ltd.

Chile.—The City of Santiago having accepted the specification for "Holophane" refractors for street lighting, the contractors for the installation (the International General Electric Co.) have placed an order for 10,000 refractors with Holophane, Ltd., of London.

Eastbourne.—Electricity Committee. Accepted:—
Cable (£6,290).—Craigpark Electric Cable Co., Ltd.

Hebden Bridge.—Education Committee. Accepted:—
Installation of electric lighting in board room and offices, Pitt Street.—G. A. Cotton.

Kidderminster.—Committee of Management, Kidderminster and District General Hospital. Accepted:—
Installing electric light in the new building.—B. French.

London.—LONDON COUNTY COUNCIL.—Accepted:—
2,000-kW rotary converter for the Elephant sub-station (£7,134).—British Thomson-Houston Co., Ltd.
Wiring and fitting houses at East Hill housing estate (£1,083).—Smethurst and Co. (London), Ltd.

Sheffield.—Electricity Supply Committee. Accepted:—
10,000-kW turbo-alternator (£30,051).—C. A. Parsons & Co., Ltd.
26 h.p. switchgear panels and 6 h.p. sub-station panels (£5,600).—A. Reyrolle & Co., Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Accepted:—
Spare rotor (£2,752).—Metropolitan-Vickers Electrical Co., Ltd.
Switchgear (£3,870).—A. Reyrolle & Co., Ltd.
Control gear, &c. (£3,801).—South African General Electric Co., Ltd.
300-amp. Edison battery (£420).; 375-amp. ditto (£533).—Associated Engineers Co., Ltd.
Two 3-phase regulators (£470).—South African General Electric Co., Ltd.
Motor pump and tank (£188).—Drysdale & Co., Ltd.
Three sets single-phase regulators (£377 per set).—South African General Electric Co., Ltd.

Worthing.—Electricity Committee. Accepted:—
H. and l.p. cables (£10,266).—Callender's Cable & Construction Co., Ltd.

Forthcoming Events.

Junior Institution of Engineers.—Friday, February 5th. At 39, Victoria Street, S.W. At 7.30 p.m. Question and discussion evening.
Friday, February 12th. Lecture on "A Visit to Some Power Stations in the U.S.A. in 1925," by Mr. W. H. Patchell.
Saturday, February 13th. At Holborn Hall. From 7.30 to 11 p.m. Annual dance.

Association of Engineering and Shipbuilding Draughtsmen (Birmingham Section).—Wednesday, February 10th. At the Chamber of Commerce, Birmingham. At 7.30 p.m. Lecture on "E.h.p. Switchgear," by Mr. G. L. E. Metz.

Institution of Heating and Ventilating Engineers.—Wednesday, February 10th. At the Holborn Restaurant. At 2.30 p.m. Annual general meeting. Paper on "Engineering Services in Hospitals and Asylums," by Mr. H. G. Cathcart. 7 p.m. Annual dinner.

Institution of Electrical Engineers.—Thursday, February 11th. At the Hotel Cecil, Strand, W.C.2. At 7 for 7.30 p.m. Annual dinner.
Monday, February 8th. At 7 p.m. Informal meeting. Discussion on "Modern Applications of Ball and Roller Bearings," to be opened by Mr. R. J. Mitchell.
(North-Eastern Centre).—Monday, February 8th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "An All-Electric House," by Prof. S. P. Smith.
(North-Midland Centre).—Tuesday, February 9th. At the Hotel Metropole, King Street, Leeds. At 7 p.m. Informal discussion on "How Can the Cost of Electrical Distribution be Cheapened?"
(Scottish Centre).—Tuesday, February 9th. At the Royal Technical College, Glasgow. At 7.30 p.m. Paper on "An All-Electric House," by Dr. S. P. Smith.
(South-Midland Centre).—Friday, February 12th. At the City Council Chamber, Birmingham. At 7 p.m. Joint meeting with the Civil and Mechanical Engineers. Address on "Road Transport and its Possible Developments." Speaker for I.E.E., Mr. C. O. Silvers.
(Dundee Sub-Centre).—Thursday, February 11th. At the University College, Dundee. At 7.30 p.m. Lecture on "The Engineer: His Due and His Duty in Life," by Mr. T. Carter.
(East-Midland Sub-Centre).—Tuesday, February 9th. At the College, Loughborough. At 6.45 p.m. Paper on "The Constants of an Electric Circuit," by Mr. R. C. Clinker.
(North-Western Centre, Students' Section).—Tuesday, February 9th. At the Milton Hall, Deansgate, Manchester. At 7.30 p.m. Joint debate with the N.W. Graduate Centre of the Institution of Mechanical Engineers.

Institution of Engineering Inspection.—Friday, February 12th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "The Application of Special Cast Irons in the Engineering Industry," by Mr. S. E. Dawson.

Electrical Engineers' Ball.—Friday, February 12th. At the Hotel Cecil, Strand, W.C.

British Electrical and Allied Industries Electrical Research Association.—Friday, February 12th. At the Savoy Hotel, Strand, W.C. At 1 p.m. Annual meeting.

Electrical Trades Commercial Travellers' Association.—Saturday, February 13th. At the Manchester Hotel, E.C. 6.30 for 7 p.m. First annual dinner.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

MAGNOLLIUM sheets (a magnesium alloy).

A recently-patented British ironing machine for laundries.

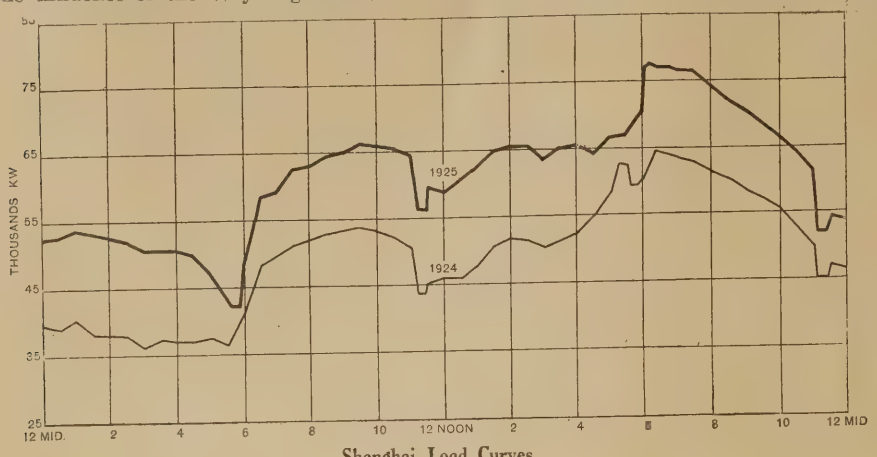
TUNGSTEN arc lamp.

Notes.

The Electrical Arrangements at the British Industries Fair, Birmingham.—We have received, at the moment of going to press, a full programme of the events which will take place during the run of the Fair at Birmingham from February 15th to 26th. We shall publish this in our next issue, but we may state now that everything points to the Electrical Section being a great success. Some seventy electrical firms are preparing exhibits. One of the principal items in the programme is the visit on Wednesday, February 17th, of members of the Incorporated Municipal Electrical Association and other representative associations connected with the electrical industry. An official inspection of the Fair will take place, and the company will lunch together. The Electrical Contractors will pay an official visit on February 22nd, the Electrical Association for Women on February 23rd, and the Electrical Wholesalers' Federation on February 24th.

The Electrical Association for Women.—A course of six evening lectures of a practical and informative nature has been arranged specially for women working in the electrical industry as saleswomen, demonstrators, &c., and for domestic science mistresses and lecturers. The lectures are to be held at the E.L.M.A. Lighting Service Bureau, 15, Savoy Street, W.C.2, at 7 o'clock on the following evenings:—February 9th, 15th and 22nd, and March 1st, 8th and 15th. The lecturers will include Mr. J. W. Beauchamp, director of the E.D.A., Mr. W. E. Bush, manager of the Lighting Service Bureau, and Miss Hodge. The course is free to members of the E.A.W., and for non-members the fee is 7s. 6d. for the course and 2s. for single lectures.

The Electro-Harmonic Society.—PRESENTATION TO MR. W. E. LANE.—On Wednesday last week, a meeting of the subscribers to a testimonial to Mr. W. E. Lane was held at the Institution of Electrical Engineers under the chairmanship of Sir George Sutton, Bart. Opening the proceedings, Sir George read letters of apology from a number of distinguished members of the Society who were prevented from attending. The hon. treasurer of the Testimonial Fund, Mr. J. E. Kingsbury, said that subscriptions ranging from five guineas to five shillings had been received, making a total of £87 18s.; many of the members also wrote letters expressing their pleasure in subscribing. Delay in holding the meeting had arisen from the illness of Mr. Lane last year, and also from his own illness. Mr. Lane had chosen that the testimonial should take the form of a cabinet and a wireless receiving set.



Sir George Sutton then addressed the meeting, expressing high appreciation of the services rendered by Mr. Lane to the Electro-Harmonic Society, and of the sterling qualities which he had displayed. Founded in 1886, the Society had filled a not unimportant place in the electrical industry. As one of the oldest members, he recalled some of the early days of the Society, when the meetings were held in the banqueting room of St. James's Hall in Regent Street; everybody knew everybody else then, for the industry was small compared with what it was to-day. They delighted in their own members' contributions—those of Alfred Izard and T. E. Gatehouse. Mr. Kingsbury was also a practical musician, and the other member of the "big four" was Mr. Henry Alabaster, who took charge of the business side. After twenty years had passed in the life of the Society a meeting was held, when Colonel Crompton made presentations to Messrs. Alabaster, Gatehouse, and Izard; now another twenty years had passed, and they were writing "finis" to its record. He thought it should not be beyond the ability of the younger generation to form a new society to look after the social side of the industry as the Electro-Harmonic Society had done. In 1901, twenty-five years ago, Mr. Lane became the honorary secretary; on behalf of the Society Sir George expressed the warmest appreciation of his long services, and he hoped the happiness which he had reaped was measured by the happiness of the members in being in contact with him. He was specially glad that a wireless set formed part of the presentation; Mr. Lane would sit and smoke and listen, and his thoughts would go back to the old days—to the violin of Gatehouse, the piano of Izard, and the companionship of his other old friends.

Mr. W. E. Lane said he could not believe that he deserved such a recognition; he had considered it an honour and privilege to serve the electrical community by carrying on the work which was begun by much abler men. Such success as had attended his efforts was due largely to the assistance and advice which he received from the committee and the executive committee, in which so many men of the highest eminence in the profession were enrolled. He was proud to feel that after nearly twenty-five years of continuous work he had gained their approval and esteem. To Messrs. Alabaster and Gatehouse he owed an immense debt of gratitude; they were his guides, philosophers and friends. Mr. Alabaster's great ability had made his work an easy task, and he was like a father to him: long might he live to enjoy the evening of his days. Mr. Gatehouse, unfortunately, had passed on; he was a man of high principles, brave, generous and genial, and keenly alive to the humorous. He was now in the Elysian Fields, and he hoped he was turning a benignant and approving eye on this gathering of his old friends and comrades. The mahogany cabinet was specially designed and built as part of his new house; and the wireless set was giving Mrs. Lane and himself infinite pleasure. Nothing could be more appropriate, and he

was deeply grateful for them. The Society was in a state of suspended animation, but its roots were alive, and the organisation was still available in London.

Mr. Sillar moved a vote of thanks to the Chairman, which Sir George briefly acknowledged.

Shanghai Electricity Undertaking Development.—We have received from the engineer-in-chief and manager of the Shanghai Electricity Department the load curves of the Riverside power station for December 29th, 1924, and the same day in 1925, which are reproduced herewith. Some idea of the influence of the very large industrial load on the station

Shanghai Load Curves.

can be gained from the curves. In addition to the lighting supply there is a very substantial heating load estimated at about 4,000 kW, but these two loads superimposed on the power load do not create a peak of any serious dimensions. It is interesting to note that the total kWh generated on the day of the 1925 curve amounted to 1,525,060, against 1,197,210 for the day of the curve for the previous year.

Old Liverpool University Students in London.—The second annual dinner of the Liverpool University London Society was held at the Florence Restaurant on Saturday, January 23rd, Prof. Reilly (Roscoe Professor of Architecture) presiding. Representatives of the University of Birmingham Guild of Graduates (London Branch) were present, and expressed a desire to run social events in co-operation with the L.U.L.S. The secretary, Mr. Harold Lloyd, 16, Blackheath Park, S.E.3, would be glad to hear from old Liverpool University students with a view to enlisting their co-operation.

Appointments Vacant.—Shift charge engineer for the Stafford Corporation Electricity Works. Electrical foreman (400 Rs. per month) for the South Indian Railway Co., Ltd. Two charge shift engineers (£376 and £292) for the Yorkshire Electric Power Co. Charge engineer for the North Met. Electric Power Supply Co. (See our advertisement pages to-day.)

Educational.—East London College.—Dr. R. L. Smith-Rose is delivering a course of six lectures (on Mondays at 6 p.m., commencing February 1st), on "Wireless Direction-finding in Theory and Practice" in the Electrical Engineering Department of the East London College (University of London). The fee for the course is 10s. 6d., but students of the engineering faculties of the colleges and institutions of the University of London can obtain free admission tickets on application. The lectures will be illustrated with lantern slides and will include experimental demonstrations.

Edinburgh.—The Edinburgh University Court has approved of a recommendation by the Senatus that an honours half course in the mathematical theory of electricity should be instituted.

The Opening of Parliament.—The King opened Parliament on Tuesday last, and in the course of his speech touched on a number of matters with which Parliament will deal during the new session. Among these was a statement that invitations were being issued to the Governments of France, Belgium, Germany, and Italy to take part in a conference upon hours of labour in industry; a mention of the industrial revival which was being threatened by industrial troubles was made; the Government's electricity proposals received a passing mention; and among the other new measures forecast were those dealing with rating and the valuation of machinery in Scotland, national health and unemployment insurance, and the control of road vehicles.

Fatality.—An employé of the Leicester Corporation Electricity Department, Andrew Minto, 21, was killed at the Aylestone generating station on January 27th, another man narrowly escaping death. Minto and his companion both received shocks which rendered them unconscious. Minto was conveyed to the Royal Infirmary, but on arrival there was found to be dead. Artificial respiration was resorted to, with successful results, in the case of his workmate. The two men were engaged in working an electric drill at the Corporation power station.

An inquest was held at Hampstead on February 1st on Mrs. M. Kleeman, who was found dead in a bath. When Mrs. Kleeman was discovered a pair of slippers were alight beside the electric radiator in the bathroom. Mr. J. Leadbeater, electrical engineer to the Borough Council, said the stove showed signs of overheating and was fused. He was of opinion that the slippers burned off some of the insulation from the wire and allowed the metal frame to become electrified.

Television.—Mr. J. L. Baird claims, according to the daily Press, to have invented apparatus which makes both wire and "wireless" television possible. He is reported to have said: "I do not transmit photographs, or want to; that has been done long ago. I transmit whatever comes before the transmitting end of my apparatus, its movement and form, with full detail. Television stands in the same relation to movement as broadcasting does to sound." Application is said to have been lodged with the Postmaster-General for permission to establish "television broadcasting stations in different parts of the country," and it is stated that a company has been formed to market the receiving devices, or "televisors." Such claims must be treated with caution, but it seems that the inventor's theory is to project an image of the object to be transmitted in a piecemeal fashion upon a light-sensitive appliance by means of a multitude of lenses which rotate in such a manner as to focus each momentarily on one part only of the object to be transmitted; owing to the retentivity of vision the successive "area" images appear simultaneously to the eye when thrown on to a ground-glass screen. The light-sensitive device must respond instantaneously to very small quantities of light, and it is declared that the face can be "clearly transmitted, not as a mere black and white effect, but with graduations of light and shade, and the detailed features are readily recognisable at the receiver; all movement is faithfully portrayed."

The Batti-Wallahs' Society.—On Wednesday last week Sir Hugo Hirst was the guest of the Batti-Wallahs' Society, at a luncheon held at the Hotel Cecil. Invited to address the gathering by the President, Mr. Pooley, Sir Hugo said much publicity had been given to his views regarding the conception of the scheme outlined by the Prime Minister, but he reserved the right to criticise it when the actual scheme was put forward. The idea of developing electricity on a more suitable basis than had obtained during the past 30 years was very welcome; in future it would be national rather than parochial, but they must use all their experience and judgment in formulating helpful criticism, so that they would go right this time. Soon after the War he had stated that the damage done by the War could only be finally repaired if this country adopted a policy of cheap electricity supply; he was not thinking of 60 super-stations, but that they had endless sources of waste power which they ought to utilise. The coal situation should be cleared up first; there was plenty of material available to satisfy both owners and miners, and in his opinion it was not likely that there would be a strike. With the assistance of a great mine owner, a working miner, and a financial authority, he had made a very careful study of the position, and he thought that the subsidy could not be stopped in the case of pits where it was otherwise impossible to pay the miners' minimum wage; the hours of work here differed but little from those worked abroad, but some miners took 40 minutes walking to their work, and by the adoption of electric haulage underground they could save 20 minutes each way and thus obtain a greater output. The State should acquire the royalties and pay for them by annuities; afterwards the royalties should be regulated in accordance with the thickness of the seams. The demand for payment for way-leaves underground was mere blackmail. The immobility of labour should be remedied; at present in some places miners were unemployed, whilst in other districts they were unobtainable, though work was available for them. There was no system of storing coal except in private ownership, and this should be put right. He believed that the coal industry could be reorganised on a paying basis, and that no one need give up anything, nor need there be any charge on the State. The fundamental mistake was that they had not made half enough use of electricity in their mines. Sir Hugo held that the mines should be organised in groups; a central power station should be erected for each group, and electrical haulage, coal-cutters, and other electrical equipment should be used in the mines. The coal should be properly cleaned before distribution, and the rubbish that was discarded should be burnt in the boiler furnaces. It was estimated that from this waste material every group could send 25,000 kW at least into the national network. They should extract all the by-products, and produce electricity at less than ¼d a unit as a surplus product. In addition to this waste fuel they should use blast-furnace gases and all other sources of waste heat. Unless they made use of their advantages in this respect they could not get cheap power—certainly it could not be done by erecting big super-stations all over the country. Cheap electricity would give them the all-electric age; they must all work with one common aim, but they must see that they had the right kind of electricity scheme.

Coal and electricity must be combined, but he hoped it would never be done under a scheme of nationalisation.

Proposing a vote of thanks to the speaker, Mr. G. W. Partridge commended the broadminded way in which Sir Hugo had approached the question, and said he hoped that those in authority would be equally broadminded and business-like. He entirely agreed with Sir Hugo as to the recovery of by-products and the grouping of mines, provided that it did not mean nationalisation. He agreed also that the desired cheap supply was not obtainable by erecting power stations all over the country. Sir Hugo had shown extreme knowledge of the subject and had adopted a common-sense view.

A 3,280-h.p. Electric Locomotive.—The Brown-Boveri Co., of Baden, Switzerland, has recently delivered the first of two powerful electric locomotives to the Paris-Orleans Railway Co. for use on the electrified section of its line between Paris and Brive, a distance of 330 miles. It is claimed that the engines, which have a rating of 3,800 h.p. and can attain a maximum speed of 87½ m.p.h., are the most powerful so far built in Europe. The following are the chief characteristics of the engines, which are designed to utilise d.c. at 1,500 volts:—Maximum tractive capacity at wheel rims, 21 tons 12 cwt.; normal ditto, 14 tons; weight of mechanical portion, 75 tons; weight of electrical equipment, 43.6 tons; number of electric motors, four; hourly capacity per motor at 1,350 volts, 950 h.p. at 510 r.p.m.=41 m.p.h.; hourly capacity per motor at 1,500 volts, 1,050 h.p. at 565 r.p.m.=45 m.p.h.; continuous output per motor at 1,350 V, 790 h.p. at 555 r.p.m.=44.7 m.p.h.; continuous output per motor at 1,500 V, 875 h.p. at 615 r.p.m.=49 m.p.h.; driving wheel diameter, 5 ft. 9 in.; gear ratio of drive, 1—2.55; overall length between buffers, 58 ft. 2 in. The machine, which is slightly conical in outline, has four pairs of centrally located driving wheels and a four-wheel bogie at the front and rear. Each pair of driven wheels is separately driven on the Buchli system, while the bogie design is that of the Swiss Locomotive and Engineering Works, of Winterthur, which was responsible for the mechanical portion of the engines. Each of the motors is provided with a fan for cooling purposes, and centrally located in the motor compartment is a main grouping switch by means of which the motors can be grouped either in series, partly series-parallel, or in parallel. The starting resistances are mounted on the roof of the engine. The engines are arranged to be driven from either end, and as they are intended to be used on both overhead and third-rail sections of the Paris-Orleans railway, they are provided both with two pantograph-type trolley arms and sliding shoes, the latter being mounted on wooden carriers supported on the front and rear bogies.

Institution Notes.

Institution of Electrical Engineers.—INFORMAL MEETING.—At the informal meeting on January 25th Mr. C. Lipman was in the chair, when Mr. H. W. Clothier opened a discussion on "Impressions of my Visit to America, mainly about Switchgear." He used a number of lantern slides to show large power stations, machines, control gear, distribution lines, &c., and said:—

"My salient impression of Canada and the United States is the largeness of the demand and consequent development of large plant. The degree of comfort in living seems to be gauged by the quantity of electrical appliances to be found in the homes. There is no scarcity of information about the public service: each undertaking issues a plentiful supply of literature. This progressive spirit creates plant which appears very large when compared with our own. Thirty or forty thousand kW turbines, which are exceptional to us, are common to them; fifty to sixty thousand kW sets are numerous; a seventy-five thousand kW steam set is on order, and a 100,000-kW design is contemplated. At Chippawa, the Hydro-Electric Commission of Ontario, the largest power station I saw, had eight 50,000-kW sets, and there is room for another, making altogether 450,000 kW in one building. Steam power stations of 250,000 kW are common, and future schemes include stations of 600,000 kW.

"On one system there are about 100 stations operating in a densely loaded area, and 30 to 40 men were engaged solely on routine examination and cleaning. In the regular quarterly round every important circuit breaker is disconnected, overhauled, cleaned, lubricated, checked, and put into service.

"How many of our undertakings have gangs of experienced fitters regularly going round to overhaul the switchgear? Supposing they were introduced, would they not in time tend to become mechanical time servers, making jobs, possibly creating accidents? My own view is that switchgear should be made sound in the first instance, with all vital parts covered up, with bolts, cotters, &c., that will not loosen, bearings that cannot rust up or jam, and then it is best left alone, just as a cable and underground joints are left.

"As a further precaution against insulation failure, users install apparatus with a greater safety factor; in important situations, at least, the installed switchgear voltage rating is higher than the normal working voltages, for instance, one finds 25,000-volt switchgear in use in power stations working at 13,500 volts. Motor-operated induction regulators are used on the 2,300/4,000-volt radial feeders, and automatic re-close circuit breakers restore the circuit automatically. A special relay is used to prevent re-closing on a bad short circuit, but otherwise the breaker would close twice and then lock out; 50 per cent. of the faults are cleared at the first shot, 25 per cent. at the second, and the remainder locked out, the time interval increasing successively; for example, 5 seconds, 20 seconds, and 40 seconds.

"It is apparent that circuit breaker design is not yet stabilised, but most breakers of from 750,000 to 1,500,000 kVA breaking capacity are enclosed in steel tanks which are grounded. Sundry features indicate an endeavour to increase the breaking capacity of circuit breakers. We think of the diversity of designs in use at home, but of 10 large stations no two were exactly alike in respect to circuit breaker construction.

"Coming from the Tyneside, where the lighting is reasonably steady, where there are practically no reactances, and where the network is all solid, one cannot help speculating to what extent American engineers have been forced to the extensive use of regulators and their accompanying complication of switching and regulating, by the greater use of reactances and the system of radial feeders. It was said at one place that without the regulators they could not guarantee the voltage at consumers' terminals within 12½ per cent."

Mr. H. Trencham, Mr. A. F. Harmer, Mr. Ferguson, and Messrs. R. C. Anderson, G. M. Davies, M. D. Hart, D. Kingsbury, and C. Lipman and Lt.-Col. K. Edgcumbe also spoke.

Junior Institution of Engineers.—Mr. F. Forrest, assistant city electrical engineer of Birmingham, speaking on Friday last at the annual dinner of the Midland Section of the Junior Institution, observed that the members would be particularly interested in the Government's electricity scheme, because the Birmingham supply was of a non-standard frequency. If, as they anticipated, 50 cycles was to be the standard, the whole of their plant had to be scrapped, a matter of enormous expense for the city. It was undoubtedly a great pity that the subject had become a political one.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

The marriage took place at Accrington, recently, of Miss GLADYS HORROCKS, elder daughter of Mr. T. Horrocks, of Accrington, and M. ALBERT L. J. JOLY, who is employed at the Paris City Council electrical power station.

Mr. J. B. WOODYATT has been appointed president of the Southern Canada Power Co., in succession to the late Mr. W. C. Hawkins. He will continue to act as general manager of the company.

We regret to learn that Mr. J. V. MOINET, burgh electrical engineer, Hamilton, is seriously ill.

Mr. S. O. ALLEN, telephone traffic superintendent, of the Southampton district, who is leaving to become district manager of the Mid-Lancashire district, has been presented by the staff with a wireless set, and his wife with some plate.

After a service of almost 21 years with Newcastle-on-Tyne Corporation, Mr. ERNEST HATTON, engineer and general manager of the city tramway system, has tendered his notice to the Corporation Transport and Electricity Committee. He has been in poor health for nearly a year.

Mr. A. EBBINGTON, assistant works manager to Marconi's Wireless Telegraph Co., Ltd., of Chelmsford, who is leaving after 19 years' service, has been presented by the staff with a silver salver and a silver cigarette box.

Last week the staff of the District Manager's Office, N.W. Telephone District, entertained Mr. WHITELAW, district manager, to dinner, prior to his transfer to the district managership at Manchester. He was presented by the staff with a gold wristlet watch; and Mrs. Whitelaw with a case of fish eaters.

Mr. G. C. DEELEY, of the Southport electricity station, has resigned. His successor will be Mr. ALFRED E. KNIGHT, of Great Yarmouth.

Mr. G. F. HARE has relinquished his connection with Messrs. David Shanks & Co., Ltd., and has joined Messrs. Smith and Ansell, Ltd., of Birmingham.

Sheffield Electricity Committee has appointed Mr. S. R. BAINBRIDGE as assistant mains engineer at a salary of £319 per annum.

The Macintosh Cable Co., Ltd., announce that Mr. C. H. HAMPSON has just been appointed their sales manager.

Mr. W. J. COTTERELL, M.I.Mech.E., was to sail for South Africa on January 29th, by the *Walmer Castle*, in connection with the important contract recently awarded to International Combustion, Ltd., by the South African Electricity Commissioners for the power station at Congella, Durban. Communications may be addressed to him, c/o Dowson and Dobson, Johannesburg.

Mr. WILLIAM BLOGG, lately sales manager of the Sterling Telephone & Electric Co., Ltd., has now joined Messrs. Alfred Graham & Co., and shortly will be leaving this country for a business tour in the East and Australasia. Any communications addressed to St. Andrew's Works, Crofton Park, London, S.E.4, will be forwarded to Mr. Blogg.

The marriage of Major G. C. MILNES, M.C., M.I.E.E., borough electrical engineer of Lancaster, to Rosie, second daughter of Mr. and Mrs. W. French, of Windsor, was the occasion of an interesting ceremony on January 26th, when Major Milnes was presented with an oak revolving bookcase and rose bowl, subscribed to by the whole of the employés of the Corporation Electricity Department.

Obituary.—MR. D. MCCOLL.—The death occurred at Seaford, Sussex, on January 20th, of Mr. Donald McColl, formerly manager of the Shanghai Tramways. He was 52 years of age.

MR. G. H. PEARSON.—The death occurred recently of Mr. G. H. Pearson, traffic manager of the Canadian Marconi Co., Ltd., Montreal.

MR. W. H. DORMAN.—We regret to record the death of Mr. W. H. Dorman, founder of the firm of W. H. Dorman & Co., Ltd., engineers, Stafford. He was 93 years of age. After practising for some time as a consulting engineer in London, he spent some years in Sweden. He commenced business in Stafford half a century ago in partnership with Mr. W. Walker. Later the business was converted into a limited company.

MR. E. B. TURNER.—We regret to record that Mr. E. B. Turner, principal of the firm of Turner Bros., 134, Upper Thames Street, London, E.C., has passed away.

MR. JOHN STEPHENS.—We regret to learn that Mr. John Stephens, director and founder of the firm of Stephens, Smith and Co., Ltd., electrical engineers, Millwall, passed away on February 2nd at 47, Grosvenor Road, Ilford, at the age of 81 years.

MR. J. D. BAILIE.—We regret to learn that Mr. J. D. Bailie, the honorary secretary of the North Midland Centre of the Institution of Electrical Engineers, passed away on January 6th. Colonel H. C. Fraser, 36, Park Place, Leeds, has been appointed secretary in his place.

New Companies Registered.

Essex Radio (Ilford), Ltd. (211,225).—Private company. Registered January 21st. Capital, £50 in £1 shares. Objects: To acquire the wireless and any allied business now carried on by H. C. Cooksey and C. N. Godwin at 123, Ley Street, Ilford, as the "Essex Radio." The first directors are:—H. C. Cooksey, 14, Glencoe Avenue, Seven Kings, Essex; C. N. Godwin, 14, Glencoe Avenue, Seven Kings, Essex. Qualification, 1 share. Secretary: H. C. Cooksey. Solicitor: J. Elborne, 1 and 3, Cranbrook Road, Ilford, Essex. Registered office: 123, Ley Street, Ilford, Essex.

Bower Electric (1926), Ltd. (211,303).—Private company. Registered January 25th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of electrical engineers, manufacturers of, and dealers in electrical, wireless, scientific and other apparatus, &c. The subscribers (each with 1 share) are:—J. R. Hudson, 2 and 3, Philpot Lane, E.C.3, solicitor; A. W. I. Mock, 2 and 3, Philpot Lane, E.C.3, clerk. The subscribers are to appoint the first directors. Secretary: D. H. Pisano. Solicitors: Abbott & Hudson, 2 and 3, Philpot Lane, E.C.3. Registered office: 15, Grape Street, Shaftesbury Avenue, W.C.2.

L. Weekes (Luton), Ltd. (211,327).—Private company. Registered January 26th. Capital, £6,000 in £1 shares. Objects:—To acquire the business of electric fuse manufacturers, electric switch manufacturers and general engineers carried on as "L. Weekes, Ltd.," at Langley Street, Luton. The subscribers (each with one share) are:—T. H. Dryden, Craven House, Kingsway, W.C.2, engineer; C. F. Butler, 331, Lordship Lane, East Dulwich, S.E.22, clerk. The directors are:—T. H. Dryden (permanent governing director) and A. L. Weekes. Qualification, 100 shares. Remuneration as fixed by the company. Solicitors: Neve, Beck, Son & Co., 21, Lime Street, E.C.

Thor Lamps and Supplies, Ltd. (211,409).—Private company. Registered January 29th. Capital, £4,000 in £1 shares. Objects:—To adopt an agreement with Haslam & Stretton, Ltd., and to carry on the business and assets comprised therein, including the registered mark of the Thor Electric Safety Lamp, and to carry on the business of manufacturers of and dealers in electric, oil and other lamps, miners' lamps, electric batteries, &c. The directors are:—L. J. Bielski ((chairman), Treleaven, Penarth, coal exporter; C. W. Jones, 56, Victoria Road, Penarth, gentleman; T. Stretton, "Silbrook," Heoldon, Whitchurch, Cardiff, engineer. Qualification, £250 shares. Remuneration, £50 each per annum (chairman, £75). Solicitor: J. H. Davis, Boston Buildings, James Street, Cardiff.

Gregson Manufacturing Co., Ltd. (211,322).—Private company. Registered January 26th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of gas, electrical and general engineers, gas, electrical and wireless instrument manufacturers, manufacturers in wood and metal furniture, novelties, patterns, packing, materials, illuminated and other signs, &c. The directors are:—A. B. Gregson, 291, Hagley Road, Edgbaston, Birmingham, electrical engineer and commercial traveller (managing and life director); W. E. S. Salt, "The Royd," Handsworth Wood, Birmingham, C.A. (chairman); H. A. Taylor, 4, Brunswick Road, Handsworth, Birmingham, works manager. Qualification, £100. Secretary: J. S. Rogers, 41, Temple Row, Birmingham. Registered office: 37-38, Sun Street West, Birmingham.

Official Returns of Electrical Companies.

Reed, Evans & Co., Ltd. (72,015).—Capital, £100,000 in £1 shares. Return dated December 31st, 1925. 92,292 shares taken up. £6,576 paid (being £1 per share on 657 and 4s. per share on 29,595 shares). £85,716 considered as paid ((being £1 per share on 62,040 and 16s. per share on 29,595 shares). Mortgages and charges, nil.

Pickvance, Ltd. (183,595).—Capital, £5,000 in 2,000 preference and 3,000 ordinary shares of £1 each. Return dated January 4th, 1926. 1,002 ordinary and 600 preference shares taken up. £650 paid on 200 ordinary and 450 preference shares. £952 considered as paid on the remainder. Mortgages and charges, £1,650.

Stanley Cooper & Co., Ltd.—Mortgage on 4, Albert Road, Bournemouth, with plant, &c., dated January 16th, 1926, to secure all moneys due or to become due from the company to the National Provincial Bank, Ltd.

Brookhirst Switchgear, Ltd. (175,995).—Capital, £550,000 in £1 shares. Return dated December 29th, 1925. 126,002 shares taken up. £30,502 paid. £95,500 considered as paid. Mortgages and charges, £25,000.

Pressland Electric Supplies, Ltd.—F. W. Stephens, of Salisbury House, London Wall, E.C.2, was appointed receiver and manager on January 15th, 1926, under powers contained in debentures dated June 30th and July 2nd, 1924, and August 10th, 1925.

L. Jacobs (London), Ltd.—W. S. Warren, of 8 and 9, Martin Lane, Cannon Street, E.C.4, was appointed receiver and manager on January 14th, 1926, under powers contained in first mortgage debenture dated May 22nd, 1925.

Woodhall Wireless Manufacturing Co., Ltd.—F. W. Stephens, of Salisbury House, London Wall, E.C.3, was appointed receiver and manager on January 18th, 1926, under powers contained in debentures dated April 28th, 1925.

British Automatic Telephone Installation Co., Ltd. (176,608).—Capital, £10,000 in £1 shares. Return dated December 22nd, 1925. 4,500 shares taken up. £4,418 15s. paid (being £1 per share on 4,175 and 15s. per share on 325 shares). Mortgages and charges, nil.

W. S. Laycock, Ltd. (in liquidation).—Satisfaction in full on June 20th, 1919, of charge dated April 4th, 1918, securing all moneys due or to become due from the company to the London Provincial and South-Western Bank, Ltd. (Notice filed January 20th, 1926.)

Sherlock Engineering Co., Ltd.—W. Hand, of Corfield and Cripwell, 12, Cherry Street, Birmingham, ceased to act as receiver or manager on January 15th, 1926.

Re-Echo Radio Co., Ltd.—C. H. Whatley, of 6-7, Charing Cross Chambers, Duke Street, Adelphi, W.C.2, was appointed receiver on January 25th, under powers contained in debenture dated January 4th, 1926.

Rhondda Tramways Co., Ltd.—Satisfaction to the extent of £6,800 on December 17th, 1925, of charges dated March 24th, 1911, November 13th, 1912, and March 11th, 1925, securing £250,000.

D. Halett & Co., Ltd. (169,979).—Capital, £5,000 in £1 shares. Return dated December 10th, 1925. 4,420 shares taken up. £320 paid. £4,100 considered as paid. Mortgages and charges, nil.

Davies, Kent & Stewart, Ltd. (81,627).—Capital, £3,500 in 2,500 preference and 1,000 ordinary shares of £1 each. Return dated December 28th, 1925. 1,974 preference and 1,000 ordinary shares taken up. £2,974 considered as paid. Mortgages and charges, £1,050.

W. G. Cannon & Sons, Ltd. (87,796).—Capital, £3,000 in £1 shares. Return dated December 10th, 1925. All shares taken up. £9 paid. £2,991 considered as paid. Mortgages and charges, nil.

Venezuela Telephone & Electrical Appliances Co., Ltd. (31,305).—Capital, £280,000 in 140,000 ordinary and 140,000 preference shares of £1 each. Return dated December 29th, 1925. 70,000 ordinary and 70,000 preference shares taken up. £83,494 paid on 13,494 ordinary and 70,000 preference shares. £56,506 considered as paid on 56,506 ordinary shares. Mortgages and charges, £140,300.

Burwood (Concessionaires), Ltd.—Debenture dated January 15th, 1926, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: J. H. Wood, 20, Lesbia Road, Clapton.

G. S. Hawker, Ltd.—Mortgage dated December 31st, 1925, to secure £900, charged on 1 and 2, Purley Downs Road, Croydon. Holder: Mrs. E. Brockley, 110, Church Street, Croydon.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Siemens Bros. and Co., Ltd.

"The future of the electrical industry is encouraging, and it is believed that the company will obtain its full share of the work in the future." These words appear in the course of a circular issued by the secretary in which is announced the board's proposal to take steps to meet future capital requirements "in view of the expansion of the company's business and having regard to the Government's policy of electrical development as recently outlined by the Prime Minister." An extraordinary general meeting is called for to-day (Central Hall, Westminster) to pass the necessary resolution. Shareholders have already authorised an issue of 1,000,000 10 per cent. cumulative preference shares of £1 each, but of these only 550,000 shares have been issued and are fully paid, leaving 450,000 of such shares unissued. The board recommends that no further issue of these preference shares should be made and that the 450,000 unissued preference shares should be converted into ordinary shares. In addition, it is proposed that the total share capital, which is now £2,500,000, should be increased to £3,000,000 by the creation of a further 500,000 ordinary shares.

The recommended resolution reads:—

"That the 10 per cent. cumulative preference shares of £1 each be limited to the 550,000 of such shares now issued and fully paid, and that the 450,000 10 per cent. cumulative preference shares of £1 each now remaining unissued shall be and become part of the ordinary share capital, and that the share capital of the company be increased to £3,000,000 by the creation of 500,000 ordinary shares of £1 each, so that thereafter the capital of the company will be £3,000,000 divided into 550,000 10 per cent. cumulative preference shares of £1 each, all of which have been issued and are fully paid, and 2,450,000 ordinary shares of £1 each, of which 1,500,000 ordinary shares have been issued and are fully paid, and the remaining 950,000 ordinary shares are unissued."

German Companies.

The *Telephone Works Company* (formerly Berliner), of Hanover and Berlin, reports a net profit of 265,000 marks for 1924-25, which is to be carried forward.

The directors of the *Allgemeine Elektricitäts Gesellschaft* state that the turnover in 1924-25 was 50 per cent. greater than in the previous year. After writing off 3,058,000 marks for depreciation, as against 2,426,000 marks in 1923-24, the net profits for the year ended September 30th last amount to 8,363,000 marks (7,223,000 marks in 1923-24), and a dividend at the rate of 6 per cent. is proposed on the ordinary shares, this comparing with 5 per cent. in the previous year.

Fife Tramway, Light and Power Co.

The report for the year ended December 31st, 1925, states that the trading profits of the concerns owned and operated by the company amounted to £114,098. Of this, £21,089 was retained by the subsidiaries and the balance paid over. After meeting administrative expenses, taxation, &c., and adding £3,480 brought forward, there remains a balance of £85,542. Loan and debenture interest absorbs £13,973; the preference dividend requires £23,801; £4,268 is transferred to stock redemption account; and £10,000 to reserve account; a dividend of 6 per cent. for the year on the ordinary shares is recommended; and there remains a balance of £9,694 to be carried forward. The report says that the company's revenue has been adversely affected by the abnormal trade depression in its area, but this has been countered by continued extension. The meeting is to be held at Edinburgh to-day (Friday).

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be officially quoted :—

Shanghai Electric Construction Co., Ltd.—100,000 shares of £1 each, fully paid, Nos. 400,001 to 500,000.

Traction and Power Securities Co., Ltd.—£65,036 4½ per cent. debenture stock.

Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Adelaide Electric Supply Co., Ltd.—£250,000 new 5½ per cent. redeemable consolidated debenture stock.

Traction and Power Securities Co., Ltd.—£65,036 4½ per cent. debenture stock.

Joseph Lucas, Ltd.—A meeting was to be held yesterday (Thursday) for the purpose of considering a resolution to increase the company's authorised capital from £800,000 to £1,100,000 by the creation of 300,000 shares of £1 each. It was explained in a circular that the new capital was required to finance the recent acquisition of controlling interests in C. A. Vandervell & Co., Ltd., and Rotax (Motor Accessories), Ltd.

Adelaide Electric Supply Co., Ltd.—The company has recently issued and sold at the rate of £96½ per cent. to the Electric and General Investment Co., Ltd., £250,000 5½ per cent. redeemable consolidated debenture stock. The stock is redeemable at par in the event of the purchase of the company's undertaking or at any time at the company's option after March 1st, 1939, on six months' notice.

Havana Electric Railway, Light and Power Co.—The *Electrical World* reports that the control of this company has been acquired by the Electric Bond and Share Co. The company operates the city railway and supplies electricity from a 50,000-kVA undertaking. The gross earnings exceed $15,000,000 per year.

Westminster Electric Supply Corporation, Ltd.—A final dividend of 2s. per share is recommended, making 15 per cent. for the past year. The directors have also instituted reduced charges, particulars of which are given in our "Lighting and Power Notes." The previous year's dividend was also 15 per cent., including a 3 per cent. bonus.

Metropolitan Railway Co.—A final dividend of 3 per cent. actual has been declared on the ordinary stock, making 5 per cent. for the year, as in 1924. The final dividend on the Surplus Lands stock is 2 per cent., actual, making 3½ per cent. for the year, as against 3⅜ per cent. in 1924.

Westinghouse Brake and Saxby Signal Co., Ltd.—The report for the year ended September 30th shows a net profit of £90,612, as compared with £17,192 in 1923-24. The dividend of 6 per cent. compares with 1½ per cent. in the preceding year. £17,503 is put to reserve and £7,866 is carried forward.

Company Struck Off the Register.—The name of the undermentioned company has been struck off the register, and it is thereby dissolved :—

Witchell's Electrical Accessories, Ltd.

City of Buenos Aires Tramways (1904), Ltd.—A final dividend of 1s. 3d. per share is recommended, making 5 per cent. for the year. It is also proposed to transfer £5,604 to the general amortisation fund and to carry forward £13,234.

Bournemouth and Poole Electricity Supply Co., Ltd.—The final dividends have been declared on the 4½ per cent. and 6 per cent. preference shares for the year ended December 31st last.

Smithfield Markets Electric Supply Co., Ltd.—A final dividend of 5 per cent. has been declared, making 8 per cent. for the year, as in the preceding year.

Enfield Cable Works, Ltd.—An interim dividend of 5 per cent. has been declared on the ordinary shares.

Dorman, Long & Co., Ltd.—An issue of £500,000 of 5½ per cent. first debenture stock, at 93½ per cent., was to be made this week.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets have been cheered by a slight recovery in the price of raw rubber, which found reflection in the values quoted by the share market. From being plunged into despondency and depression, the rubber market turned cheerful again upon the very moderate rally in the price of the produce. This had an indirect effect in most departments of the Stock Exchange. The gilt-edged markets are firm, although there remains a lurking doubt as to the possible movements during February in the money market. In the electrical world, the boomlet in cable and equipment shares received something of a check, prices remaining good on the whole.

The hint as to probable forthcoming new issues, thrown out in last week's ELECTRICAL REVIEW (page 188), happened to appear on the same date as the announcement from Siemens Brothers that the company intends to take steps to meet further capital requirements. The board recommends that 450,000 unissued 10 per cent. preference shares shall be converted into ordinary and that the total share capital shall be increased from the 2½ millions sterling to three million pounds by the creation of a further half-million ordinary shares. The meeting to carry the necessary resolutions will be held on Friday in this week. Siemens fell back from 35s. to 33s. 9d. on the proposals.

The Metropolitan Railway fulfilled general expectation by announcing a dividend at the rate of 6 per cent. for the past half-year, making 5 per cent. for the year. This is satisfactory to the shareholders, who felt qualms about the maintenance of the dividend in view of the falling off of £246,000 in the gross revenue. The shrinkage is due to the fact that last year's Wembley Exhibition proved so much less popular than its predecessor. The price of the stock has risen 10s. and Surplus Lands are 2 up, at 71. Districts are better at 48. There has been a general rise in the issues of the Underground Electric Railways of London, the Income Bonds improving to a point below par.

The electricity supply market continues to be a little uncertain in regard to the issue of the Government's plans as this is likely to affect the older undertakings. In the new session of Parliament which has just opened, the Government's plans will no doubt be unfolded in sufficiently full detail to enable a better judgment to be reached than has been possible up to the present. We have already sketched some of the arguments that prevail in regard to the likelihood of the new plans interfering in no way with the existing London supply companies, and have suggested that, conceivably, the latter may be benefited rather than disadvantaged by the proposed legislation. It is natural enough, however, that proprietors of electricity supply shares, who can now see in most cases quite substantial increases in capital value over the original cost of their investments, should feel inclined to sell part for prudence sake. The idea has got abroad also that dividends on electricity shares are going to be limited to 7 per cent., an idea which conveys, of course, a totally wrong impression, because the companies are to distribute their reserves, and this distribution will, in the majority of cases, have the effect of bringing up the dividends to, roughly speaking, the rates that have been paid of late.

Charing Cross ordinary are down a shilling, Metropolitans are similarly lower and Kensingtons, after their burst of strength last week, have reacted to the extent of 5s. City of Londons are 2s. 6d. down, Westminsters a florin, and the only improvement in the London list is a gain of 1s. 3d. in South Metropolitan preference, which has lifted the price to 1 5/16. Whitehall Electric preference are better at £1. The provincial shares are unchanged in price on the week.

The outstanding feature in our share list this week is a rise of 6 in Brazilian Tractions, the price having risen to 92. No fresh reasons are advanced to account for this rise other than those already mentioned on several previous occasions in this column, namely, the buying from Canada and New York on the recently-increased dividend, and the report that the shares are being accumulated on behalf of a Canadian-American syndicate bent upon securing control. The 6 per cent. preferred have strengthened to 101. Beyond this, and a point rise in British Columbia deferred, the prices in the traction and tramway list show no changes.

A general drop in prices of shares in the manufacturing group is a sequel to the rather overdone character of the previous boomlet. British Electric Transformer preference are better at 1. Telegraph Constructions rose 10s. to 28. These are about the only upward movements. The falls are fairly extensive. General Electrics escaped from the reaction that included British Aluminium, British Insulated, India Rubber, Henleys, Johnson & Phillips, and several others. Babcocks participated with a drop to 52s. 6d. The reason that prompted the selling is that holders of such shares recognise the high levels which many of the quotations have reached, in relationship to the dividends that are being paid. That the companies are doing extremely well is generally known, but the recent advance in share-values has gone some way towards discounting the immediate future. It should be mentioned, however, that the market is by no means flooded with orders to sell. What the Stock Exchange calls—without being able to define—the undercurrent, is sufficiently strong to warrant the expectation of a further rise when the present sellers are "out."

Marconis are a dull market. Nor does the probability of a settlement being reached in the wireless strike serve to arouse interest in Marconi shares. The price has receded to 25s. Oriental Telephones are harder at 2 3/16. Automatics remain at 53s. 9d. The Eastern group of cable stocks and shares is placed. Rubber shares show a general recovery, but hesitation is felt as to the outlook for the raw produce market, and the public are playing for safety rather than for profits-by-purchase.

B.E.S.A. Publication.—The British Engineering Standards Association has just issued a specification for industrial reflector fittings for electric lighting (No. 1). It covers seven sizes of British industrial circular types, which are designated according to the nominal consumption of the lamps for which each is suitable, and the distribution of light contemplated is suitable for use in installations in which the spacing of the lamps is 1½ times the height.

A comprehensive table gives the nominal diameter, the minimum effective interior diameter, the minimum thickness of steel used for making the reflector fitting and particulars of suitable lamps complying with B.E.S.A. Specification No. 161, 1924, for each size of reflector fitting. The angle of cut-off specified complies with the recommendation contained in the second report of the Departmental Committee on Lighting in Factories and Workshops, 1921; but attention is drawn to the fact that this figure may be altered at a later date when the results of certain experiments which are being carried out are available. The total luminous output is given as 60 per cent., but it is pointed out that an efficiency of about 70 per cent. was obtained with this type of reflector under the conditions which were usual formerly: the conditions have been altered as mentioned above in order to reduce the amount of glare and so comply with the recommendations of the departmental committee. Methods of selection for testing and of efficiency measurement are also given in the specification.

Copies of the new publication (No. 232, 1926) may be obtained from the B.E.S.A. Publications Dept., 28, Victoria Street, London, S.W.1, price 1s. 2d. post free.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Continued from page 193.*)

Everett, Edgcumbe & Co., Ltd.

This firm's exhibits covered a wide range, from a 2½-in. dwarf-pattern milliammeter up to a 300,000-V voltmeter, and from protective relays to integrating photometers. The latter each comprise a 3-ft. cubical enclosure, to which are attached the comparison and balancing arrangements necessary to enable the total flux of light in lumens to be determined at a single measurement. An outstanding feature of the exhibits was the Relay Graphic Recorder, fig. 20, designed for installation on electric trains, &c., where the conditions of vibration and acceleration are very severe. Three charts give simultaneous records of current, voltage, and train speed. They are driven over revolving drums in perfect synchronism by a small motor running at constant speed. The motor also provides the necessary power for moving each recording pen across

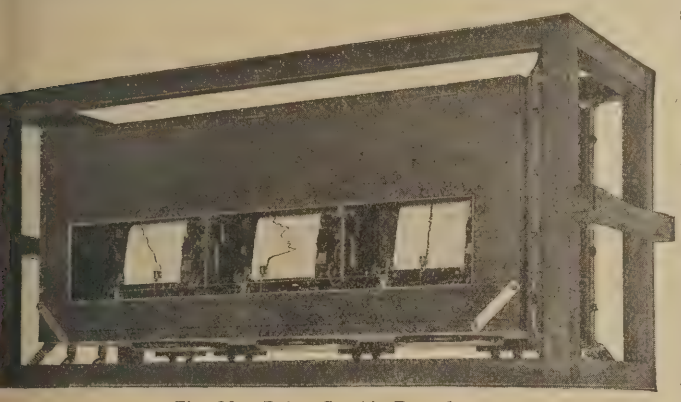

Fig. 20.—Relay Graphic Recorder.

the respective chart, in response to the deflection of an electrical movement, designed to measure the quantity in question. The correct timing of the charts is ensured by a sensitive centrifugal speed governor, which varies the field strength of the motor as may be necessary to make it run at constant speed, whether on a.c. or d.c. The measuring element proper consists of a short arm, provided with a substantial contact, which moves between two fixed contacts, serving to energise one or the other of two electro-magnets, which, in their turn, operate a simple two-way friction clutch. This clutch causes the driving motor to carry the pen across the chart in one direction or the other, according to the dictates of the measuring unit. The whole action is claimed to be perfectly dead-beat and "snappy." It is also claimed that all friction between the inking mechanism and the paper is eliminated, so that, if desired, a delicate electrical movement may be employed. The absence of the clock with its attendant troubles is another advantage. The instrument is rendered immune from the ordinary disturbances of vibration by the provision of a special spring suspension in a cradle. Any number of recording mechanisms can be operated simultaneously from the single driving motor, with the certainty that the charts are running in perfect synchronism. There are also a number of attachments for indicating different conditions. It is understood that a number of these instruments have been supplied to railway authorities, both in this country and abroad, and are giving every satisfaction.

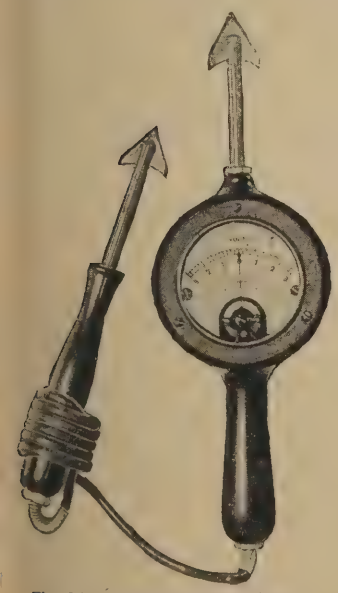

Fig. 21.—Large-Scale Cell Tester.

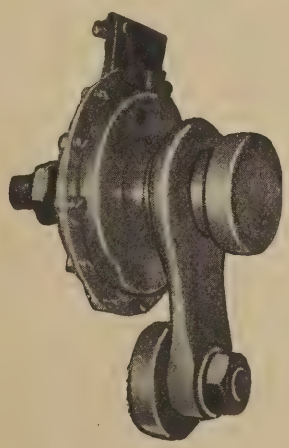

Fig. 22.—Radio-Frequency Current Transformer.

Another interesting exhibit took the form of a new cell-testing voltmeter, fig. 21. The feature of this instrument is the "super-scale," rendering the indications particularly easy to read. It is suited for testing high-pressure batteries, the case and handle being made of insulating material, moulded in one piece.

A 1,000-A current transformer, fig. 22, designed for radio frequency measurements, was another item of interest on this stand. This device, which is of the patented construction due to Mr. F. Ockenden, is believed to provide the only satisfactory solution of the problem of designing a current transformer which will stand up to frequencies of 100,000 cycles or more, and which, at the same time, is thoroughly shielded from stray radio-frequency fields. The design is based upon the fact that for satisfactory operation, the magnetic linkage between the primary and secondary circuits must be perfect, and this result is obtained by completely surrounding the iron core and its secondary winding by the primary winding, which consists of a complete copper sheath. We understand that these transformers have been supplied for frequencies up to 5,000,000 cycles (corresponding to a wave-length of about 60 metres) and, in fact, have been adopted exclusively for the new Post Office transmitting station at Rugby.

A high-pressure electrostatic voltmeter, claimed to be the smallest of its kind yet produced, was also seen. It can be scaled up to 3,000 V for a.c. or d.c., and measures only 2½ in. across the dial. It is designed to meet the requirements of radio engineers, especially for use on aircraft, where both space and weight are of fundamental importance, but where, at the same time, the working conditions are most severe. The whole of the high-pressure movement is mounted on a solid base of insulating material, a cavity in which serves as the damping chamber.

Siemens Bros. & Co., Ltd.

This firm showed some new water-tight indicator and selector switch combinations for use with thermo-electric pyrometers and distance thermometers, which are designed particularly for use on board ship but are suitable for use in any place where protection from damp and moisture is necessary. The indicators are of the pivoted moving-coil type and are of robust construction. The scales are calibrated in Centigrade or Fahrenheit degrees, as desired, and the movements, &c., are enclosed in strong water-tight gunmetal cases. The selector switches are of the press-button type, the buttons being arranged in a circle. Any thermometer may be instantly connected to the indicator by pressing the corresponding button and will remain connected until a second button is depressed, when the first one is automatically released. The last-pressed button may also be released by turning a central knob. Either packed glands or conduit nipples are provided for the cable inlets. Fig. 23 shows a 10-way selector switch and indicator combination. A four-colour temperature recorder, an optical

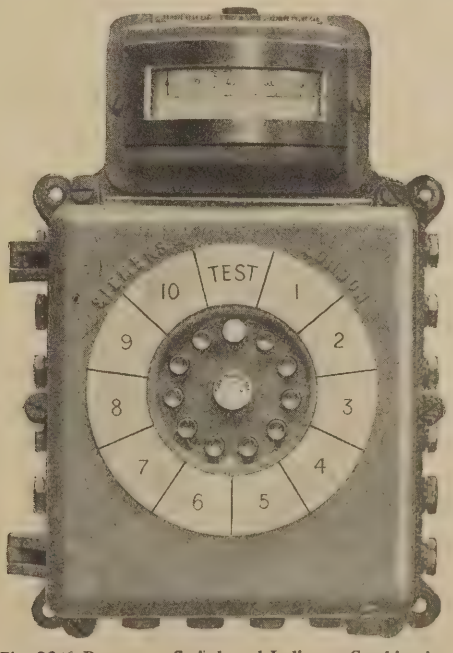

Fig. 23.—Pyrometer Switch and Indicator Combination.

pyrometer for measuring temperatures up to 2,400 deg. C. and a thermo-electric potentiometer for the measurement of thermo-couple e.m.f.'s were among the other exhibits of this firm.

The Zenith Manufacturing Co.

Among the items of interest exhibited by this firm was a neon-tube rectifier, fig. 24, designed for charging small high-pressure accumulators of the kind now in fairly common use for radio reception, being suitable for a charging current of 0.19 A. It is equipped with a regulating resistance in the primary circuit so as to give a very wide control of the charging pressure and current, rendering it capable, it is claimed, of covering all ordinary conditions. The resistance, together with a d.p. fuse and switch, is fitted at the side of the containing cabinet in a readily accessible position.

Fig. 24.—Neon Tube Rectifier.

The rectification is effected by means of two large neon rectifier tubes fitted in the cabinet in a vertical position. Owing to the large electrodes necessary in these tubes it is essential that the latter are operated vertically, otherwise the weight of the electrodes would be likely to fracture the glass support in the event of the rectifier receiving a sharp knock or serious vibration. The overall efficiency of the device is claimed to be of the order of 30 to 38 per cent. The complete rectifier is furnished with flexible cords and lamp adaptor, and battery clips for connection to the accumulator and lamp socket during charging.

George Kent, Ltd.

The chief exhibits of interest by this firm were Avery- and Martin-type telerecorders for measuring steam or water flow. The Avery instrument is designed primarily for a.c. The transmitting instrument, fig. 25, consists of a variable transformer, the rotating portion of which is moved in proportion to the rate of flow through the main. A secondary voltage is induced in the rotating element, which varies from zero to its maximum value in accordance with the variations in the rate of flow. The energy supplied to the primary also passes through a current coil of an "inverted" watt meter,

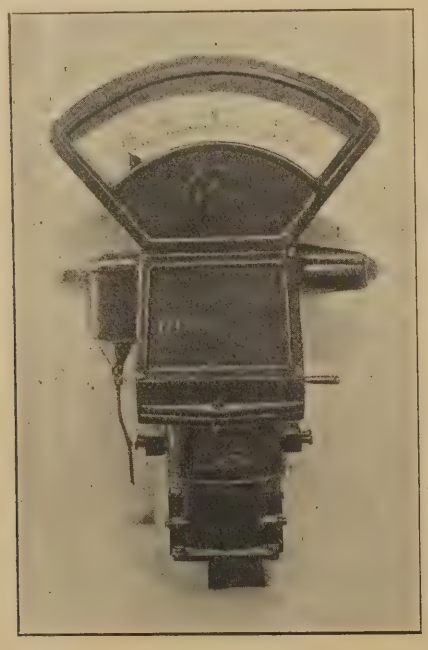

Fig. 25.—Telerecorder A.C. Transmitter.

which serves as a counter instrument for registering the total quantity of steam or water passed, and the induced energy is passed through the pressure element. By means of a solenoid connected across the instrument terminals, an artificial pressure drop is used to compensate for fluctuations in the line voltage.

The Martin-type instrument is used in connection with d.c. The transmitter consists of the usual boiler-load indicator, and the movement is effected by means of a suitable cam on a contact arm, which moves across the surface of a resistance connected across the d.c. mains. The contact arm moves in accordance with the variation in the rate of flow, and causes the ratio between the two parts of the resistance to vary, the parts referred to being divided by the point of contact with the arm.

Weston Electrical Instrument Co., Ltd.

A new portable miniature a.c. voltmeter, model 330, was seen among the exhibits of this firm; but for a deeper base it resembles the d.c. model 280. The movement is of the iron coil dynamometer type suitable only for a.c. circuits. It has a resistance of 20 ohms per volt and is claimed to be accurate to about 1 per cent. A new radiator panel voltmeter, 2 in. in diameter, and designed for use upon receiving sets, was another interesting exhibit. For ranges b low 50 volts it has a sensitivity of 125 ohms per volt and for higher ranges, 200 ohms per volt. Another new exhibit was the firm's model 440 portable pivoted moving-coil galvanometer. This instrument has a 1 mm. deflection. A.c. and d.c. dynamometer-type laboratory standard instruments were shown and also various patterns of switchboard instruments. A range of miniature instruments added to the interest of the display. Some of these are of particularly delicate construction, the movements weighing as little as 5 grains.

The Cox-Cavendish Electrical Co. (1924), Ltd.

On this stand was shown some actino-therapeutic apparatus for ultra-violet radiation and a diathermy apparatus for thermo-penetration or coagulation of the tissues.

Edison Swan Electric Co., Ltd.

This firm exhibited a range of d.c. Pointolite lamps, varying from 30 to 1,000 c.p., and a selection of 150 c.p. Pointolites for a.c. operation.

The New Oscilloscope Co., Ltd.

This firm showed the Elverson oscilloscope used for investigating the behaviour of machinery under working conditions.

Adam Hilger, Ltd.

Among several interesting items displayed on this stand was a piezo-electric resonator by which the piezo-electric effect in quartz crystals is applied to the control of radio transmitters and in the standardisation of wavemeters and kindred apparatus. When a series of potential variations is applied at varying frequencies there is a marked resonance at a frequency dependent upon the dimensions of the crystal, with a consequent alteration in the state of the associated electrical circuit. Hence by subjecting the crystal to the influence of an alternating electrical impulse supposed to be of its resonant frequency its accuracy may be verified and corrected when suitable means of indication are employed. The quartz is encased in a suitable insulating material and provided with two exterior terminals. Another exhibit was a selenium detector. This is a new apparatus designed for detecting infra-red, visible and ultra-violet radiations by noting the alterations produced in the electrical properties of selenium caused by radiations incident upon it. It was exhibited in conjunction with a Hilger ultra-violet monochromatic illuminator showing the ultra-violet spectrum of mercury vapour. The cell is of course connected to a sensitive galvanometer. The Hilger therapy spectroscope was also shown. This is a simple type of quartz train spectroscope provided with a fluorescent screen to make visible the ultra-violet portion of the spectrum under observation, designed for checking the ultra-violet emission from lamps used in ultra-violet treatment.

Newton & Wright, Ltd.

Some heavy apparatus was shown by this company; a notable feature of the exhibit was a 125,000-V unit of a three-phase transformer, to work in connection with a rectifier of new design, giving 10 milliamperes at 250,000 volts, for X-ray work, being one of a pair ordered for cancer research. The bushings were oil-filled, and the top cover was of horn fibre. The weight of these transformers is two tons each.

Amongst other items were the "Hercules" X-ray tube, and a new foot-operated switch. For the prevention of corona at the high pressures used in X-ray work, C.T.S. reel cables were shown.

Stonebridge Electrical Co., Ltd.

This company showed a wide range of instruments in a variety of styles and finishes, including flush edge-wise instruments with flat front plates, electrostatic voltmeters for ranges up to 150,000 volts, recorders, portable precision instruments covering a variety of purposes, and resistance thermometer equipments for generators and transformers.

Creed & Co., Ltd.

The Creed "Start-stop" printing telegraph system, said to be the first of its kind developed in this country, was shown, the instruments comprising a keyboard transmitter and perforator, an automatic transmitter, and a printer. The first-named may be used for direct transmission by hand from the keyboard, or in conjunction with the automatic transmitter. The printer is on the same lines as the well-known Creed standard printer. The Murray Multiplex system was also exhibited.

(To be concluded.)

The Power Factor of a Cable Dielectric.*

Its Consideration as a Function of the Applied Voltage.

By L. EMANUELI, M.I.E.E.

THE relation between the power factor and the dielectric of an impregnated-paper cable and the applied pressure is, to say the least, complicated. It has been pointed out, however, that it is a means of judging the quality of the cable and accordingly details of the study of the subject will be of interest.

The first experiment was carried out on a certain fixed quality of paper, impregnated with different qualities of oil and compound, under such conditions that bubbles, or films, of gas were eliminated. A second series of experiments was also carried out. For the first series the apparatus shown in fig. 1 was used. The paper was dried in a stove and placed in several layers between the two electrodes *a*, furnished with

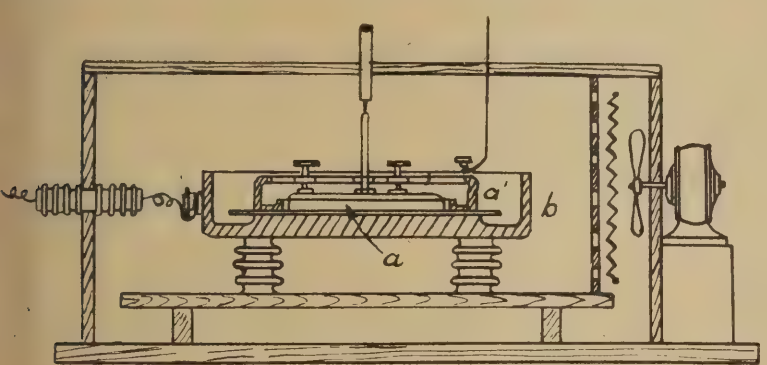

Fig. 1.

a guard ring *a'* and *b*, both suitably heated; keeping *a* raised a few centimetres above the surface of the paper sheets, a vaccum was created in the apparatus, the large opening at the top being closed with a suitable cover. The complete apparatus was placed in a stove so that, besides the vacuum, a temperature of nearly 90 deg. C. could be maintained.

After some hours in vacuum, the oil, or the compound, under examination (previously dried) was introduced into the apparatus by means of atmospheric pressure. The vacuum was maintained for at least three hours, then broken, and when the apparatus had cooled the top *a* was allowed to come into contact with the surface of the paper, this being done in order, so far as was possible, to prevent gas films forming in the dielectric. The measurements at different temperatures were generally made in steps of increasing temperature, in order to avoid the thermal contraction of volume giving rise to gas films. This precaution was subsequently found to be unnecessary.

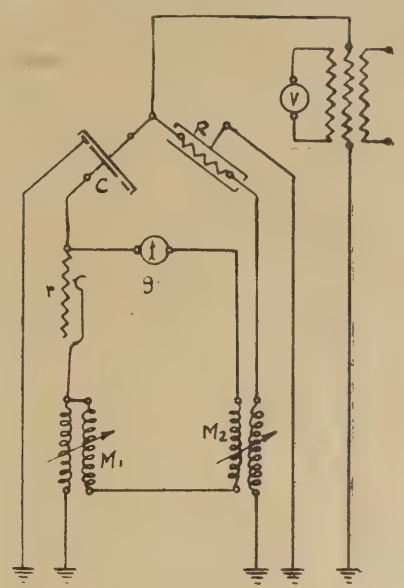

Fig. 2.

The method used to determine the power factor is shown by fig. 2, C being the condenser under test, R the ohmic resistance, M_1 and M_2 two mutual inductances (only one of which need be variable), r a resistance, and g a vibrating galvanometer. When the phase angle of the dielectric is small, then $C = M_2/rR$ and $\cot \phi \div \cos \phi = w M_1/r$. It has been supposed that R is great in comparison with the self-induction of the primary of M_2 and that the resistance of M_1 is small in comparison with the capacity of C. These conditions were satisfied in the tests, the value of C being of the order of 0.0006 microfarad (the frequency was 42); the ohmic resistance of the primary coil of M_1 was 17 ohms and the coefficient of self induction of the

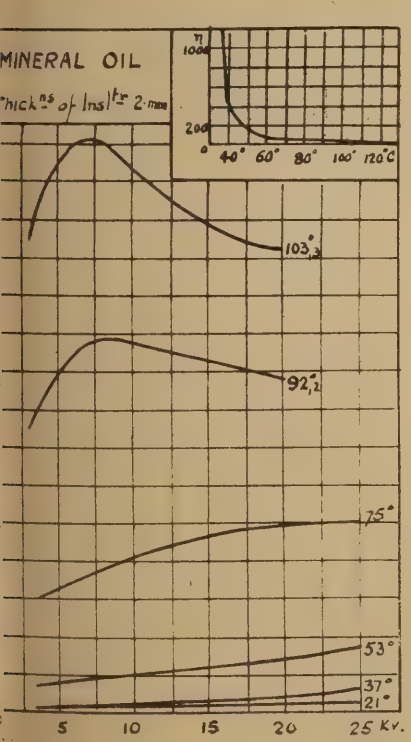

Fig. 3.

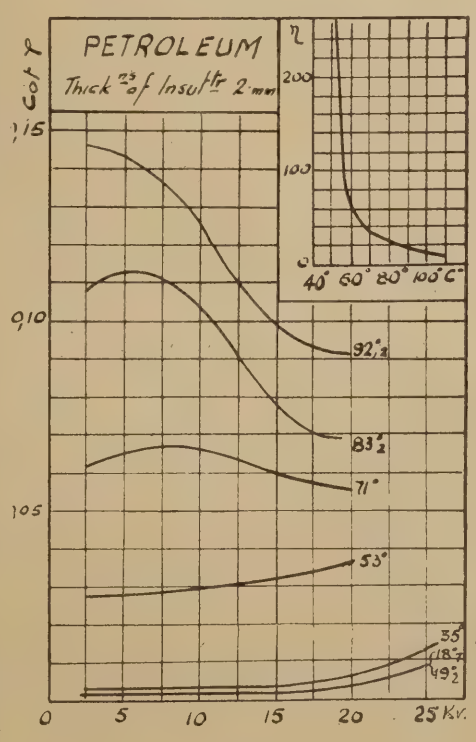

Fig. 4.

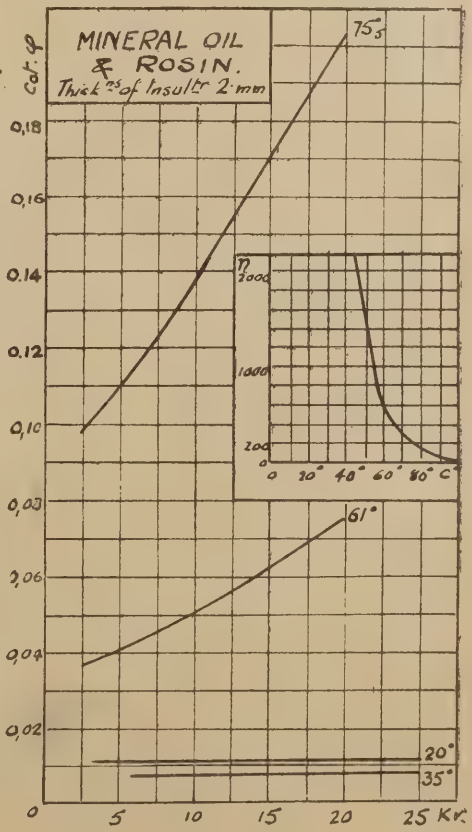

Fig. 5.

* A paper read before the third meeting of the International C.H.P. Conference, Paris, June, 1925, and reproduced by permission of the Conference.

primary coil of M, was 118 millihenrys. Owing to the fact that R is not a pure resistance and to the presence of the inductance of the primary coil of M_2 the phase error was measured once, using an air condenser instead of C, as well as comparing R with a water column resistance and calculating the effect of the inductance in series. Thus, a value was found

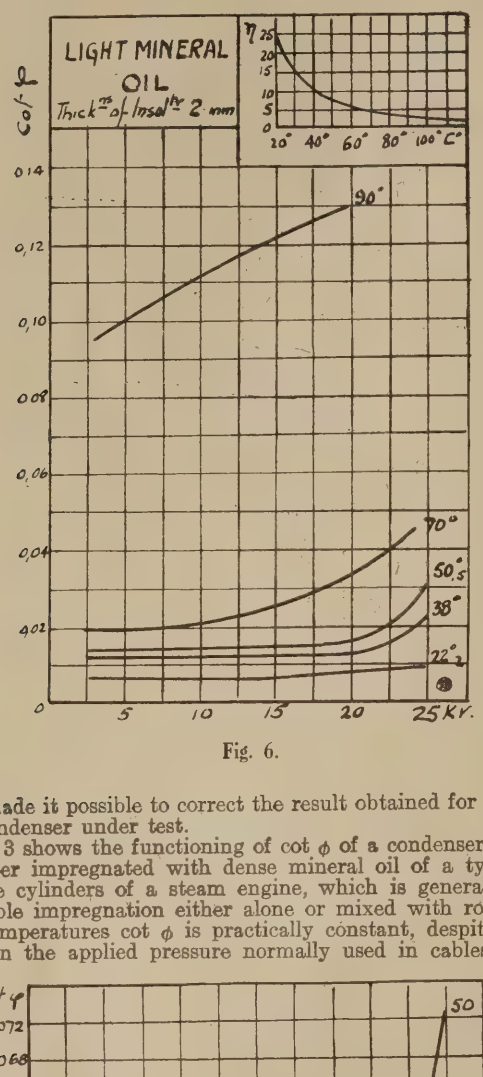

Fig. 6.

that made it possible to correct the result obtained for cot ϕ of the condenser under test.

Fig. 3 shows the functioning of cot ϕ of a condenser formed of paper impregnated with dense mineral oil of a type used for the cylinders of a steam engine, which is generally used for cable impregnation either alone or mixed with rosin. At low temperatures cot ϕ is practically constant, despite variations in the applied pressure normally used in cables. For

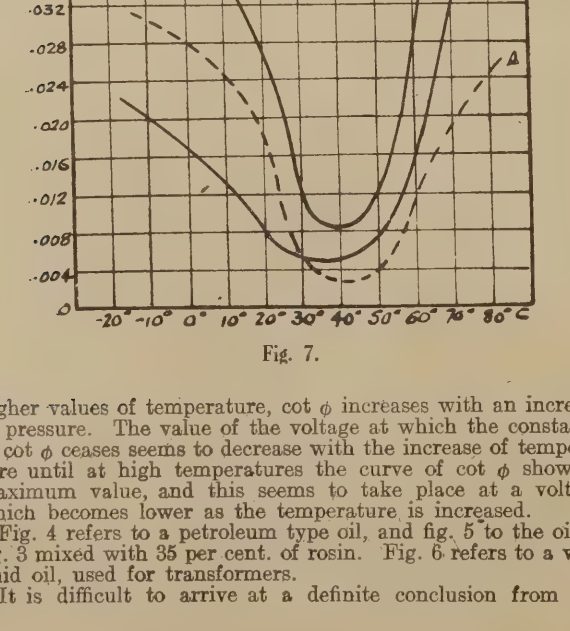

Fig. 7.

higher values of temperature, cot ϕ increases with an increase in pressure. The value of the voltage at which the constancy of cot ϕ ceases seems to decrease with the increase of temperature until at high temperatures the curve of cot ϕ shows a maximum value, and this seems to take place at a voltage which becomes lower as the temperature is increased.

Fig. 4 refers to a petroleum type oil, and fig. 5 to the oil of fig. 3 mixed with 35 per cent. of rosin. Fig. 6 refers to a very fluid oil, used for transformers.

It is difficult to arrive at a definite conclusion from the above experiments, but it is quite probable that in the range of temperature between 12 deg. and 30 deg. C. and with the gradients used in cables, the variation of cot ϕ with the voltage is very small, so that it may be considered practically constant.

In cables the matter is very different, especially because of the gas films left during the impregnation, the dimensions of which change with the temperature and with the history of the conditions which the cable has been subjected to. The amount of data obtained is voluminous; the following are some characteristic results: Fig. 7 refers to a three-phase cable of 35,000 volts working pressure, with conductors of 175 mm², and it shows the change in the relation of cot ϕ with the temperature, measured at 10,000 and 50,000 volts. In the figure there is also shown (dotted line) the curve of the difference in power factor at the two voltages; the latter curve is characteristic, and all cables show it in greater or less proportions.

The presence of a minimum may be explained by the aid of the first series of experiments in the following way: Starting from low temperatures, it may be assumed that the volume of the gas films decreases with an increase of the temperature, due to the fact that the impregnating mixture increases in volume. The pressure of the gas in those films need not necessarily increase very much, because with the increase of temperature and pressure, the gas is more soluble in the compound. Therefore, the variation of cot ϕ with the voltage decreases with the increase of temperature; on the other hand, at a certain temperature, which varies with the type of com-

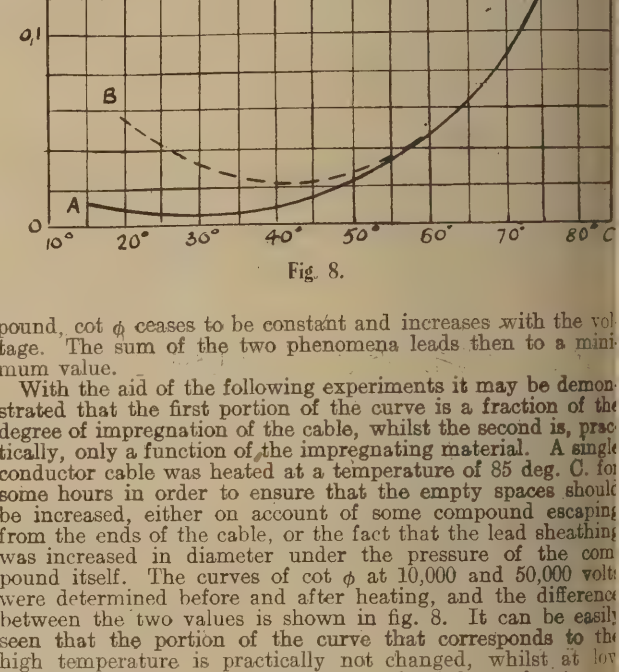

Fig. 8.

pound, cot ϕ ceases to be constant and increases with the voltage. The sum of the two phenomena leads then to a minimum value.

With the aid of the following experiments it may be demonstrated that the first portion of the curve is a fraction of the degree of impregnation of the cable, whilst the second is, practically, only a function of the impregnating material. A single conductor cable was heated at a temperature of 85 deg. C. for some hours in order to ensure that the empty spaces should be increased, either on account of some compound escaping from the ends of the cable, or the fact that the lead sheathing was increased in diameter under the pressure of the compound itself. The curves of cot ϕ at 10,000 and 50,000 volts were determined before and after heating, and the difference between the two values is shown in fig. 8. It can be easily seen that the portion of the curve that corresponds to the high temperature is practically not changed, whilst at low temperatures the difference between the values of cot ϕ at high and low pressures is considerably increased.

From what has been shown above, it follows that under certain limitations of temperature the variation of the power factor may be an index of the degree of impregnation of the cable. It is questionable, however, if it would be right to impose strict conditions on the manufacturers when the heating of the cable under working conditions may spoil the impregnation of the dielectric in a permanent and irreparable way. From this point of view the question arises whether for high-pressure cables, a limit to the working temperature can be determined, considering the possibility of spoiling the impregnation and taking into account also the periods of low temperature at which the cable may be required to work. It must be observed, however, that although it may be easy to make qualitative statements on this subject, it is not such an easy matter to arrive at exact limiting figures.

R.A.F. Vacancies.—The Air Ministry announces that five hundred aircraft apprentices, between 15 and 16½ years, are required by the Royal Air Force for entry into the School of Technical Training, Halton, Bucks. They will be enlisted by open and limited competitions held by the Civil Service Commissioners and the Air Ministry respectively. Successful candidates will be required to complete 12 years' service from the age of 18, in addition to the training period. Full information regarding the scheme can be obtained from the Royal Air Force (Apprentice Department), 4, Henrietta Street, W.C.2.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Electric Hammer.

A recent development in the United States takes the form of a new electric hammer working on the principle of the electro-magnetic coil and its attraction for an iron core. The Syntron hammer, fig. 1, operates on ordinary 60-cycle electric circuits with 3,600 blows per min. on the shank of any tool inserted into the bit. In contrast to the usual motor-driven hammer, it has only one moving part, the piston, which is drawn back and hurled forward through a bronze barrel. The hammer is suitable, it is claimed, for drilling holes in concrete, brick or stone, for smoothing stone or concrete surfaces, for bush hammering, cutting, channeling, &c. When used with a star drill, the hammer is rated to drill concrete to a depth of three in. per min. The device is manufactured by the NATIONAL ELECTRIC MANUFACTURING COMPANY, of Pittsburgh, Pa., U.S.A., and is distributed in all countries outside the United States by the Westinghouse Electric International Company.

Fig. 1.—Electro Magnetic Hammer.

Fig. 2.—Electric Oil Hoist.

An Electric Oil Hoist.

An electric oil hoist, fig. 2, which has been marketed by the AMERICAN HOIST & DERRICK CO., St. Paul, Minn., is described in the *American Machinist*. It consists of a cylinder and piston with a load hook attached to the latter. An electric motor and an oil pump are provided at the top end of the cylinder and a system of piping and operating valves is placed between the pump and the cylinder ends. The motor, which is controlled by a snap-switch, pumps the oil from above to below the piston, thus raising the load. A valve in the piping is regulated to allow the piston to force the oil back again to the top of the cylinder, the piston and load descending under gravity. By regulating the valves the load can be raised or lowered to any point within the travel limits of the piston. A truck arrangement for suspending the equipment from an overhead track is provided.

An Improved Coal-cutter Protection.

In view of the recent Home Office recommendations to the effect that the coal-cutter machine must have a flame-proof enclosure separate from the starter enclosure, the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, has produced a new system for the automatic protection of coal cutters, coal conveyors, and trailing cables. The essential apparatus for the new system includes a low-voltage control switch, supplied for mounting in any type of coal cutter, a special gate-end starting box, and a standard form of trailing cable with suitable standard terminal plugs.

The motor cannot be started, it is claimed, except by a simple flameproof drum switch mounted on the coal cutter, and has only three positions, *viz.*, forward, off, and reserve. The pressure of the control circuit does not exceed 20 volts, the power circuit to the motor being made and broken in the gate-end starting box. Overload and no-volt relays are re-set from the coal cutter simply by bringing the starting handle to its off position. A sensitive leakage trip device acts instantaneously with leakage to earth or between phases, and is capable of being adjusted to trip down to 5 per cent. of the full-load current of the motor, and after a leakage trip the relay remains latched out, preventing a re-start. A mechanical interlock prevents the opening of the starter box except with the contactor in the open position, and the motor cannot be started from the coal cutter until the gate starting box is properly closed. The box is fitted with an external lever by which the coal-cutter motor can be stopped under all conditions. Red and white signal lamps mounted in a flame-proof device within the gate-end box behind stout glass windows, show respectively when the gate-end box is connected to the supply, and when current is through to the coal cutter. Standard trailing cables and terminal plugs and sockets are used. Rise above earth potential of the casing of either the coal cutter or gate switch is guarded against by making it impossible for the motor either to start or to run except with an efficient earth connection between the case of the control switch on the coal cutter and the case of the gate-end starter. The apparatus is mounted within a strong flameproof boiler-plate box. Both front and back covers slide within deep machined grooves, and have handles for easy withdrawal.

The principles of operation may be seen from the diagram, fig. 3. The main power circuit passes from

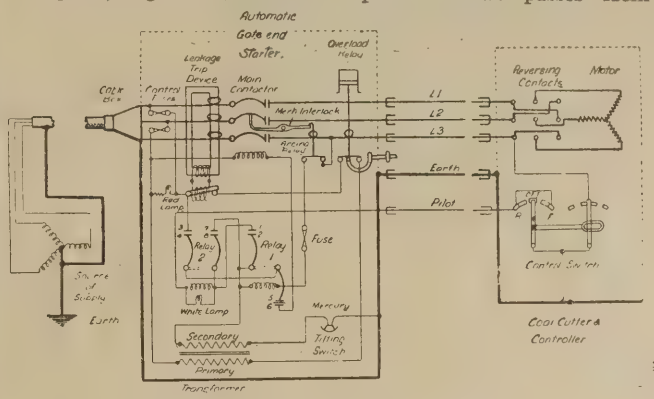

Fig. 3.—Diagram of Coal-Cutter Protection.

the incoming cable box on the gate-end starter, round the leakage trip device, to the main contactor, one lead passing round an arcing relay and an overload relay, and the three-power cores L1, L2, and L3, of the trailing cable leading *via* reversing contacts on the coal-cutter control switch to the motor. Control circuit No. 1 passes from incoming lines the L1 and L2 through control fuses shown adjacent to the cable box, through the contacts of the leakage trip device, the contacts of the overload relay, and the transformer primary. Control circuit No. 2 passes from the transformer secondary through the tilting switch to the starter-box case, through the earth core to the coal cutter case, the auxiliary contacts shown to the right in the diagram of the control switch to power cable L3, through the contacts of the arcing relay and a fuse to the operating coil of off position re-set relay No. 1, and back to the transformer secondary. Control circuit No. 3 passes from the transformer secondary, through contacts 1 and 2 of Relay 1, through the operating coil of Relay 2, through the pilot core to Contacts R or F of the controller, through the case of the coal cutter and the earth core to the case of the gate-end switch, and thence through the tilting switch back to the transformer secondary.

An Improved Hole Cutter.

Cooke's improved hole cutter, fig. 4, which is marketed by the SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, London, W.C.2, should prove a very useful tool for electrical wiremen and fitters in many cases where it is required to drill large holes in metal posts, boxes, &c., in positions which do not lend themselves to the use of ordinary drillers, ratchets and clamps, &c. It consists of a small threaded centre pin, provided with a hollow head, to contain the cuttings and chips, which is inserted in a prepared pilot hole. A knurled feed nut is screwed down until the cutting edges engage with the surface of the plate and the body of the tool is revolved by means of tommy bars, pressure being gradually applied until the hole is completely made. It is claimed that burring or mis-shaping of the edge of the hole is prevented by the fact that the upstanding rim of the pressure pad holds the job in close contact with the cutter.

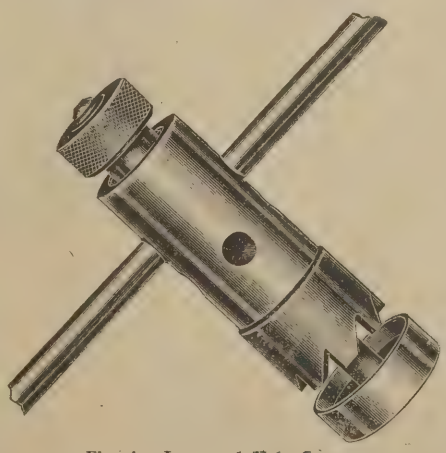

Fig. 4.—Improved Hole Cutter.

Metal-clad Switchgear for Single-phase Circuits.

New Ferguson, Pailin Single-pole Gear for Sub-circuits.

It has been said that the use of metal-clad switchgear of the draw-out or drop-down patterns for controlling high-pressure, single-phase, sub-circuits, though often desirable, has been "prevented by the prohibitive cost of that type of gear." Accordingly, in order to meet the case, Messrs. Ferguson, Pailin, Ltd., are now manufacturing a "type AV" single-pole switch with a maximum capacity of 100 amperes at 3,300 volts, which is arranged for mounting on pipe framework, isolation being accomplished by lowering the movable portion. The fixed portion, fig. 1, comprises a casting that accommodates the busbar, neutral bar (if required), cable box, isolating contacts, and downrods for supporting the removable portion. A hinged plate covers the isolating contacts when the switch portion is withdrawn, thus rendering all live gear inaccessible, while the busbar is of circular section and between units is run in iron tube; both the busbar chamber and cable box are compound filled. The cable-box is suitable for either single-core or concentric cable and provision is made for accommodating a neutral link if it is desired to isolate the neutral connection.

The removable portion of the switch, fig. 2, comprises the circuit breaker, trip coil, and isolating contacts. In order to isolate the breaker it is only necessary to undo the nuts at the bottom of the down-rods and the whole of the circuit-breaker portion as shown in fig. 2, and trip coil, which are mounted on a frame arranged to fit inside the oil tank, may be removed. The breaker contacts are of the standard Ferguson, Pailin laminated-brush pattern with arcing tips; the operating mechanism has a parallel motion and a free-handle, while overload protection may be obtained by means of a directly-connected overload coil, and an adjustable oil dashpot time lag may be fitted if desired. The complete unit has been designed to occupy the minimum space and may be mounted at 8-inch centres.

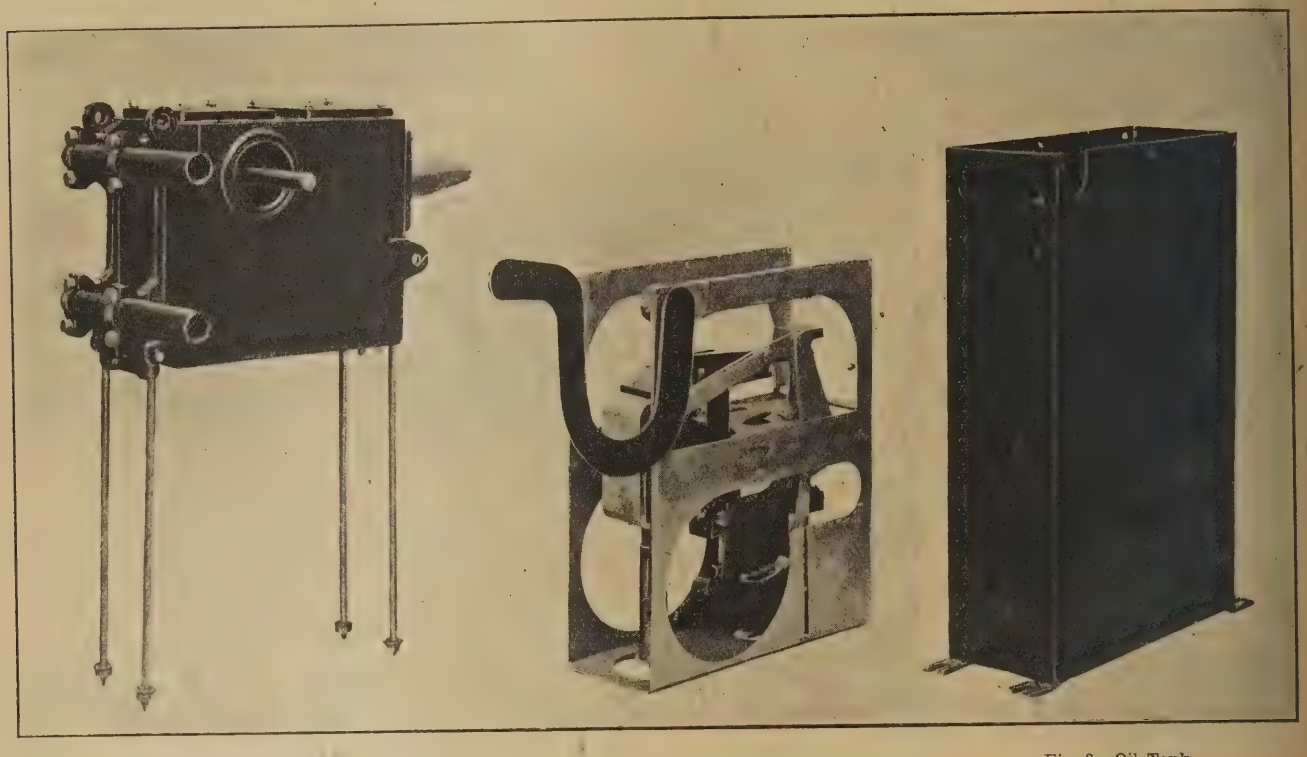

Fig. 1.—Fixed Portion. Fig. 2.—Circuit Breaker. Fig. 3.—Oil Tank.

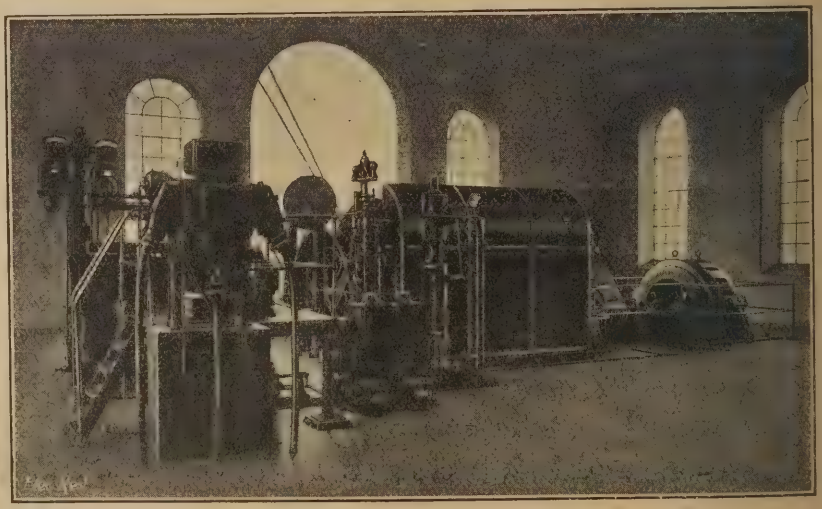
New Ferguson, Pailin Metal-Clad, Single-Pole, Switchgear for Small Single-Phase Circuits.

British Electrical Plant for Costa Rica.—A preliminary agreement has been entered into between a British electrical company and the Compañia Nacional Hidroeléctrica de Costa Rica for the installation in the capital, San José, of a new hydro-electric plant. The whole of the equipment will be of British manufacture.—*Reuter's Trade Service* (San José).



A Modern Electric Winder.

Some Particulars of the Plant at North Celynen Colliery.

An interesting example of an electrically-operated winding plant is to be found at the new house-coal pit of the Newport Abercarn Black Vein Steam Coal Co., Ltd. It is designed for an output of 270 tons per hour from a depth of 510 ft. and has a cylindro-conical drum 8 ft. to 12 ft. in diameter, single-reduction straight-tooth gearing being employed between the electric motor and the drum.

Although it was first used for sinking the pit, it is now employed for lifting coal; the drum diameters are proportioned to give lower power peaks throughout the wind.

Straight-post brakes are fitted with cast-steel bracket ends; they are housed in heavy cast-iron brackets and carry wooden blocks. The brake force is applied through a spring in conjunction with a floating lever, and while the braking effort is ordinarily derived from weights, assistance is given by introducing air to the top side of the brake piston, the combined effort being sufficient to hold the maximum pull of the motor. The brake solenoid is capable of giving a pull of 100 lb. through a 2-in. stroke. It is designed for a service of 40 operations per hour, and is supplied at 400 V from a 5-kVA transformer. It operates two single-pole, ironclad, limit, self-resetting switches. The overwind and overspeed preventer is of the "Whitmore" type. A dial-type depth indicator is installed on the machine, the pointer of which makes about ¾ of a revolution during the wind. The control platform carries all the operating gear, including the motor control lever, the brake

The North Celynen Electric Winder.

and emergency levers, and a gear for tripping in the case of current or air-pressure failure.

A 400-h.p. motor, 412 r.p.m., 2,200 V, 3-phase, 50 cycle, drives the winder. It is mounted on two pedestal bearings, and is fitted with a half-coupling forged solid with the motor shaft for connection to the gears. The switchgear consists of a draw-out circuit-breaker pedestal, controlling the main 2,200-V, 3-phase, 50-cycle supply; the pedestal carries the current and potential transformers for the ammeter and voltmeter installed on the instrument pillar, and trifurcating boxes for the incoming and outgoing mains.

The oil circuit breaker has three overload time-limit releases and a low-voltage no-close device. A suitable tank lifter is also provided for the breaker.

The motor is operated by a liquid controller of the moving-electrode type, arranged for both hand and compressed-air lever operation, and is provided with accelerating governor gear. The electrodes are so arranged that they are continually submerged in the electrolyte, thereby preventing any possible chance of open flashing between the phases.

The installation was supplied by the General Electric Co., Ltd., in conjunction with its Fraser & Chalmers Engineering Works.

The Electrical Imports of Peru.

THE following figures show the values of the imports into Peru of electrical goods and apparatus in 1924. Comparative figures for 1923 are also given, together with a note of increases or decreases. The Peruvian £ = about 20s.

Frequency Variations in Thermionic Generators.

By LIEUT.-COL. K. E. EDGEWORTH, D.S.O., M.C., Royal Signals, A.M.I.E.E.

(*Abstract of paper read before the* WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

FOLLOWING a reference to the variations of frequency which occur in the pendulum-controlled mechanical oscillating systems, the phase relationships of currents and potentials in a thermionic generator are examined, and it is shown in the paper that the frequency of the oscillations is affected by the coupling between the grid and anode circuits. Equations are obtained which give the difference between the frequency of the oscillations generated and the resonant frequency of the tuned circuits; they show that the variations of frequency connected with the method of coupling are analogous to the reversible variations existing in a pendulum-controlled clock. With normal coupling the thermionic generator goes "slow," with reversed coupling it goes "fast," and with resistance coupling the variation disappears. Three "irreversible" variations of frequency are connected with a change in the (i) effective inductance of the circuit which occurs when the oscillation is free instead of forced; (ii) the resonant frequency of a damped circuit which occurs when the oscillation is free instead of forced; and (iii) associated with the presence of harmonics in the e.m.f. generated by the valve. Certain points in the design of thermionic generators employing resistance and reversed coupling are discussed; the experimental results obtained with various types of circuit are explained in terms of the theoretical variations previously discussed, and the characteristics of different types of constant-frequency generators are then compared. The practical applications of the results fall into two main classes, namely, wave-meters and transmitters (including master oscillators). In the case of power-driven generators, the high- and low-voltage current will usually be obtained from the same machine, and changes of voltage will presumably be of the same character. It is possible, therefore, to balance changes in anode voltage against changes in filament voltage, and a very close regulation should be obtainable in this way. Assuming a 10 per cent. variation in the voltage of supply, it seems quite possible to reduce the frequency variations to something of the order of 1 in 50,000, or 200 cycles per second at a frequency of 10,000,000.

In the case of the heterodyne wave-meter, a lower order of accuracy is likely to prove sufficient. The instrument would be adjusted so as to make it independent of variations in filament voltage, leaving only the residual frequency variations

associated with changes of anode voltage. These are considerably reduced by the adjustments made in connection with the filament voltage, and are of the order of 1 in 20,000 for a change of 10 per cent. in the voltage of supply. If necessary, they may be still further reduced by using a high anode voltage (nearly high enough to stop the oscillations altogether).

Three solutions of the problem of constructing a constant-frequency generator are referred to as: (i) The rheodyne generator; (ii) the orthodyne generator with grid bias, and untuned grid circuit; and (iii) the antidyne generator with grid bias. These three methods have not yet received sufficient trial to enable one to speak very decisively as to their merits, but their probable advantages and disadvantages may be indicated.

The *rheodyne generator* is more complicated than most types of orthodyne generator, as it involves the use of two tuned circuits and an arrangement for neutralising the stray capacity coupling. It does not, however, impose any restriction on the amplitude of the oscillations, and appears to be specially applicable to small transmitters in which it is not desired to incorporate a master oscillator.

The *orthodyne generator*, in conjunction with grid bias and an untuned grid circuit, appears to involve a considerable reduction in the amplitude of the oscillations generated, which would render it unsuitable for use in actual transmitters, although it would be suitable for wave-meters and master oscillators. It has the advantage of simplicity and employs only one tuned circuit.

The position of the *antidyne generator* with grid bias is rather difficult to define. The Colpitts circuit with suitable grid bias seems to have considerable possibilities, but the author is unable to say whether a sufficiently constant frequency is obtainable without some sacrifice of amplitude. The antidyne generator with an untuned anode appears to be less advantageous than the orthodyne generator with an untuned grid.

Regarding future possibilities, the employment of the thermionic generator which will keep its wave-length constant within 1 part in 50,000 will make heterodyne reception possible on wave-lengths of 30 m. or less, and the production of such a generator now appears to be a practical possibility. Variations in wave-length due to changes in aerial capacity have already been reduced to a low figure by the use of master oscillators, and the employment of a constant-frequency circuit for the master oscillator would appear to remove any troubles connected with the voltage of supply.

The development of heterodyne wave-meters which will give an accuracy of 1 part in 10,000 is another interesting possibility. There are a number of details in the design of such an instrument which require further study, but now that variations connected with the voltage of supply have been removed, there is no reason to suppose that any of the outstanding difficulties are insuperable.

For proper modulation radio-telephony requires a band of 10,000 or 20,000 cycles, but a very much narrower band is theoretically sufficient for wireless telegraphy, and the number of channels of communication which is theoretically available on the shorter wave-lengths is very great. The number of channels actually available at the present time does not approach these theoretical limits, but is determined by the unavoidable variations in the wave-length of transmitters. Any method which will reduce the variations in wave-length of short-wave transmitters will automatically increase the number of channels of communication available for practical use.

Radio on Aircraft.—Another daring seaplane flight was begun on January 22nd by Major Franco, of the Spanish Royal Air Service, accompanied by Captain Ruiz de Alda, a specialist in wireless telegraphy and aerial navigation, and a mechanic, who set out from Spain for the Argentine. The total distance covered was 1,800 miles, and the flight took about eight days. The machine was specially equipped for the trip with a Marconi AD6 aircraft telephone transmitter and receiver of the type which has been adopted as the standard fitting for British civil aircraft. A Marconi type 14 direction finder was also fitted for navigational purposes, and the Marconi Co. arranged with its affiliated wireless companies in South America to keep in touch with the seaplane when it approached South America. The King of Spain issued a royal order in which he conveyed thanks to the Compañia Nacionel de Telegrafia sin Hilos, Madrid, for the assistance which it gave to Major Franco, and for the arrangements which it and Marconi's Wireless Telegraph Co. made with other associated wireless companies in Brazil, the Argentine, Canada, and the United States for co-operation.

A New Peril.—According to *Science Service*, amongst the items of scientific progress in 1925 was the following:—Professor Gilbert N. Lewis announced a new theory of radiation based on the Einstein view of time, which makes a distant star and the eye-ball of an observer come into virtual contact.

Exide Service.

A New Depôt at Acton.

The Chloride Electrical Storage Co., Ltd., in the furtherance of the excellent service facilities which it is providing all over the country, as well as abroad, has recently opened a new depôt at Lexden Road, Acton, to serve the South of England. The premises were formerly a garage belonging to the London General Omnibus Co., Ltd., and have a floor area of 25,000 sq. ft., all on the same level. The new premises serve a four-fold purpose; they are at once a stores, a repair depôt, a charging depôt, and assembly shops. The stores section is in efficient communication with the company's works at Clifton Junction, and a fleet of petrol and electric vehicles is available to provide stocks for Exide service depôts at short notice. The repair organisation deals not only with the company's batteries, but also those of any other make. An extensive room is provided for battery charging; it has a floor area of 8,000 sq. ft., and motor-generator equipment capable of dealing with a very large number of accumulators. Arrangements are made for the speedy replacement of exhausted vehicle batteries by others fully charged, and there is a spacious covered yard in which waiting vehicles can be parked. The accompanying illustration conveys an idea of the extent of the battery-charging room and its equipment. It was noticed during a recent inspection that the leads are either clipped to the accumulator terminals, or where lead terminals are fitted connection is made by fixing a bare copper wire with a tap from a hammer—very simple but quite efficient. An ample stock of plates of all types is maintained, as well as containers, crates, &c. The new depôt is well staffed to ensure quick attention, and is already doing an extensive business in each of its departments.

The New Acton Exide Depot—Battery-charging Room.

Water Power in Italy.—In *Annali de utilizzazioni delle Acque*, Vol. 2, No. 2, 1925, Mr. C. Bonomi supplies the following table, which shows the progress that has been made in the development of water power in Italy from the end of 1920 to the end of 1924:—

Province.	End 1920.	End 1922.	End 1924.
North Italy.			
Piedmont	365,530	452,885	532,882
Liguria	14,660	15,348	22,060
Lombardy	326,309	387,804	424,810
Venice	76,046	84,394	134,281
New provinces	81,699	81,699	84,623
Middle Italy.			
Emilia	17,813	25,679	29,379
Tuscany	20,527	22,887	27,489
Marche	29,892	38,526	42,310
Umbria	168,363	200,501	200,501
Latium	39,031	40,031	45,035
South Italy.			
Abruzzi and Molise	92,248	100,426	104,029
Campania	20,268	57,148	57,148
Apulia	—	4,400	4,400
Basilicata	—	1,000	2,153
Calabria	710	4,082	6,592
Sicily	11,400	14,832	14,832
Sardinia	—	—	10,380
Totals	1,273,496	1,513,642	1,742,904

While these developments embrace the whole of Italy, it will be noted that the greatest progress has taken place in the north. Whether or not the whole of this water power is applied to hydro-electric purposes is not stated, but certainly the greater proportion is thus used. It will be noted that, while there is nothing sensational in the progress of water-power utilisation in the period covered by the above figures, approximately half a million horse-power has been added to the water power harnessed in Italy since the end of 1920.

The Institution of Electrical Engineers.

Annual Dinner of the North-Western Centre.

The semi-jubilee dinner of the North-Western Centre of the Institution of Electrical Engineers took place at the Midland Hotel, Manchester, on January 26th, the chairman of the centre, Mr. A. G. Ellis, presiding. There were about 250 present.

The toast of "The City of Manchester and the Royal Borough of Salford" was proposed by Sir Holberry Mensforth, K.C.B., C.B.E., Director General of Factories, and was responded to by Alderman Delves, the Mayor of Salford. Councillor Mitchell, the Lord Mayor of Manchester, was unable to be present.

Lieut.-Col. Sir Joseph Nall, T.D., D.S.O., M.P., proposed the toast of "The Institution of Electrical Engineers." He said in the future development of electricity in this country care must be taken not to embark upon schemes which involved enormous calls upon the public purse, and not to hamper by legislation the ordinary development brought about by private business. There was a wide field for investigation and legislation in the matter of standardisation, but whilst they could achieve much by standardisation and encourage and guide enterprise by legislative action, they might also do a great deal of harm unless care was taken. Whatever advantages might ultimately accrue from the system of railway grouping, the immediate effect had been to hold up schemes of electrification which would have been carried out by this time if the railway companies had continued their separate existence. Some schemes had apparently been abandoned owing to the indirect influence of coercive legislation. He hoped and believed the Government's electricity proposals would not be unduly coercive nor restrictive, but would remove many difficulties and pettifogging restrictions, and that the results, in the next few years, and also in the years to come, would be of inestimable benefit to the people concerned.

Mr. R. A. Chattock, President of the I.E.E., who was received with musical honours, replied to the toast. He said there was nothing wrong with the I.E.E. One of its chief duties was to adapt itself to the needs of its members; and in that connection he reminded his audience of the Wireless Section which was now being developed. It was hoped that it would help in the development of the wireless industry by getting the general body of the members interested, and making them feel that they were being catered for by the Institution. Recently, a proposal had been made to form a separate Institute of Wireless Engineers; he could not speak too strongly against it. Sectional institutions would fritter away the strength of the parent Institution.

He thought the industry would be helped along very considerably by the British Industries Fair. An Electrical Trades Section was being started; it was going to be very representative, and those who went to see it would find it very advantageous. Considering the number of visitors who were coming from abroad, it should have a very good effect upon the electrical trade of this country.

Generally speaking, the Government's electricity scheme had met with approval, though certain sections would undoubtedly create opposition. The scheme was explained in greater detail at a conference he recently attended at the Ministry of Transport, but the explanation was confidential. That was very unfortunate, because he felt that the greater the publicity given to the scheme, and the more it was thrashed out by those interested in it, the better it would be for the country. They did not want these schemes to be carried out in a hole-and-corner fashion. If there was something which they felt was not good for the country, they ought to be allowed to say so publicly, to criticise it, and to try to get it put right. The President of the Birmingham Chamber of Commerce had said manufacturers were very dubious about the scheme, and they felt it was useless to try to discuss it unless they had before them the basic figures on which the scheme was built. It was all very well for a Government Department to say: "We have investigated this matter, we have gone into the figures, and we are satisfied"; but, as intelligent citizens, they ought to have the figures.

On several occasions this country had been accused of being backward in electrical development; comparisons with America and the Continent were made. He could not see why that attitude should be taken up, because the British electrical industry was as efficient as any in the world. Development was going on at an increasing rate. Birmingham was providing for 700 to 1,000 new customers per month. That did not look like falling behind; they were going ahead, and at this rate would soon catch up to America. No warnings or stimulants were needed; he really did not see that there was any need for the criticism and pessimism of which so much was now heard.

With regard to the development of rural areas, they were being treated unfairly. The big industrial centres were anxious to get back into the country and to open it up, but the delays and obstructions were disheartening. Even after an Order had been obtained, it took months to get wayleaves. He was sure the Ministry of Transport could help in those matters. He wished every success to the scheme—subject to reservations. Before agreeing with it, they wished to be satisfied that the dislocation of their business was justified.

The toast of "Our Guests" was proposed by the chairman in an admirable speech. In responding, Sir PHILIP NASH, K.C.M.G., C.B., referred to the electricity proposal; he said that in his opinion it was a non-party measure, and it had three great advantages—it was conceived on big and broad lines; it was constructive—not obstructive nor destructive; and in the main it was not impracticable.

Mr. S. L. PEARCE, C.B.E., M.Sc., who also replied to the toast, said the work which confronted the Electricity Commissioners was extremely complex, and the difficulties were perhaps made greater at the present time because they had to take care that their actions to-day would not hamper the carrying-out of the Government proposals. For full details of the proposals they must necessarily wait till the presentation of the Bill. It had been questioned whether a new body such as the proposed Electricity Board was needed; it was the definite conclusion of Lord Weir's Committee that it was necessary, to give full effect to the scheme, and there was no statutory body in existence which could possibly fill the same rôle. It might be regarded as a kind of Super-Joint Electricity Authority for the whole country. There was no intention to abolish the existing regional authorities, which had done excellent work, and would continue to perform most useful duties; certain powers of the Board might be delegated to them as its agents. The consumption of electricity per head could be greatly increased by the use of cheaper energy and cheaper apparatus, and both these advantages should result from the scheme. In the next 15 years they hoped to advance from 2,400,000 kW installed to 8,000,000 kW, and from an output of 5,500 million kWh sold to 21,000 millions a year. It was essential that they should take a long view. Those who would be affected by the proposals were entitled to be satisfied that the scheme was sound. It had been urged that the economies effected would be offset by the cost of the transmission lines, of standardisation, and of administration; they might be sure that these matters had been most carefully investigated, and a mass of figures had been compiled and confirmed by eminent advisers. The various undertakings, obviously, could not all share the benefits equally, but if it could be shown that any interest were prejudicially affected by the scheme, he was sure that sympathetic consideration would be given to representations to that effect. It was not sought to set up fettering Government control, but to work through and assist the existing agencies as far as possible. The Commissioners had no axe to grind and no sectional interests to serve; their one aim was to develop the electricity supply industry in this country.

Mersey and North Wales Centre Dinner.

The Mersey and North Wales (Liverpool) Centre of the Institution of Electrical Engineers held its annual dinner on Friday last at the University Club, Liverpool, when a large number of members and visitors were present, and Mr. A. E. Malpas, Wh.Sc., M.I.E.E., chairman of the centre, presided.

"The Institution of Electrical Engineers" was submitted by Mr. J. SANDEMAN ALLEN, M.P., who expressed admiration of the work of the Institution. The work that was done by electrical engineers was so great and important, that it could only be adequately conceived by viewing it in the national and international sense. It was only by industry adapting itself to modern needs and requirements that the country's trade would be maintained and developed. Electrical engineers were not straggling individuals, but were organised into a great national Institution, with 50 years' experience behind it, and a total strength of 11,740 members.

Mr. R. A. CHATTOCK, president of the Institution of Electrical Engineers, responded, and commented on the fashion of establishing new institutions. Referring to the training of engineers, he said he had received communications from students who said they had had no opportunities of getting on. They expressed the feeling that they were being sidetracked. If that spirit was interpreted into words it would militate against the Institution. If there was no room in this country for engineering students, there was plenty of room in the Empire, and they could not do better than get out into the world. The establishment of lighting development bureaux in various towns would have very far-reaching effects in the electricity supply industry. He hoped the idea would be extended to the cooking and heating part of the business. Supply engineers alone knew what an excellent load factor would be provided, and a high load factor meant cheap production. As to the Government scheme, he hoped it would not be made a political stunt. He felt that the politicians were trying to go a little too fast, as developments of that kind could only come about gradually. The efficiency of power stations had trebled during the last 15 years, and the last word had by no means been said. He was of the opinion that the Electricity Commissioners should consult the engineers in the industry and thrash out with them all the details of a scheme. He could say, however, that a more or less concrete scheme had been evolved, but the details had not yet been made public. He was glad that the Minister of Transport had been called in to discuss the matter. Such

conferences would be a great benefit to the industry and the country. He was sure that all would be glad that the Government did not intend to subsidise the industry. Subsidies were not only disheartening, but disintegrating, undermining energy and enthusiasm that otherwise would be put into the work.

Mr. A. G. ELLIS, chairman of the North-Western Centre, proposed "The City of Liverpool," and took the opportunity of commenting on the friendly relations and the good fellowship between the local Centre and the North-Western Centre. In the electrical engineering manufacturing business, exports amounted to 30 per cent. of the total production, most of which was shipped from Liverpool. The export trade in British electrical manufactures was practically one-third of the total electrical export business of the world, the other main portion being shared by Germany and America. The Liverpool electricity supply system was laid down on such lines that it would be able to link up with other concerns when standardisation was introduced.

The LORD MAYOR OF LIVERPOOL responded, and spoke of the enormous developments of the Liverpool tramway undertaking and the electric power and lighting department.

Mr. B. WELBOURN proposed "The Guests." The electrical engineering industry in this country, he said, was not so far behind as it was often represented to be. There was one area, the North-East Coast, where the consumption was 800 kWh per head of the population per annum. At St. Helens the figure was over 1,000, and in the smaller town of Prescot it was 500. Industrial Lancashire was a big consumer, but the chief backwardness was in the non-industrial and agricultural areas of the country. In those places there was very little demand.

Mr. T. R. WILTON, M.Inst.C.E., President of the Liverpool Engineering Society, complimented electrical engineers on solving one of the greatest problems of town life—doing away with the great curse of smoke.

The final toast, that of "The Chairman," was proposed by Mr. H. H. HARRISON, and acknowledged by Mr. A. E. MALPAS.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from January 27th:—

Honeycomb. No. 459,684. Class 8. Electrical coils for use in radio-telegraphy and telephony.—Igranic Electric Co., Ltd.

Radio XXX super sensitive crystal (lettering and design). No. 462,285. Class 8. Instruments, apparatus and accessories for use in connection with radio-telegraphy and telephony.—M. Feldman, 2a, Barrack Street, Meanwood Road, Leeds.

Reco. No. 463,073. Class 8. Radio-telephonic receiving sets and parts thereof.—H. J. Roberts, trading as the Roberts Engineering Co., 110, Old Street, E.C.1.

Zenite. No. 463,595. Class 8. Electrical resistances.—R. Lehmann and Co., Ltd., Zenith Works, Willesden Green, N.W.2.

G.K. Liquitone (lettering and design). No. 463,537. Class 8. Radio-telephonic receiving sets and parts thereof.—Gladwell & Kell, Ltd., 258, Gray's Inn Road, W.C.1.

Filtron. No. 465,534. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—E. A. Graham, trading as Alfred Graham and Co.

B. & T. (lettering and design). No. 464,651. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Baird & Tatlock (London), Ltd., 14-15, Cross Street, E.C.1.

Magnatone Aerial Encircles The World (lettering and design). No. 465,110. Class 8. Aerials for use in radio-telephony.—Sparklets, Ltd., Angel Road, Upper Edmonton, N.18.

Marconite. No. 464,994. Class 50. Electrical insulating substances of asbestos, mica, resin, oils or bitumen.—Marconi's Wireless Telegraph Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1923.

27,262. "Electrically-operated make-and-break devices for use in horns or warning devices for vehicles, or for use in electric bells, interrupters for spark coils, and the like." Fuller's United Electric Works, Ltd., and A. P. Welch. November 14th, 1924. (245,556.)

27,367. "Tuning-coil holder." H. A. Hickson. November 17th, 1924. (245,557.)

29,274. "Plug-in fittings or attachments for inductance coils for wireless receiving or transmitting apparatus or for other uses." F. H. Alston. December 6th, 1924. (245,569.)

29,592. "Electric switch plugs." J. E. S. E. Honor and C. W. H. Honor. June 19th, 1925. ((245,572.)

29,693. "Valve-holders for wireless receiving sets." C. Pressland. December 10th, 1924. (245,574.)

30,765. "Automatic excess-heat protector, especially for electric machines and apparatus." W. Hickel and O. Pletscher. December 22nd, 1924. (245,581.)

1925.

248. "Electrical terminals." E. M. Taunton. January 5th, 1925. (245,586.)

602. "Diaphragm sounders." F. Krupp Germaniawerft Akt. Ges. October 10th, 1924. (Addition to 225,569.) (241,150.)

1,253. "Grid resistances." Rheostatic Co., Ltd., and L. Satchwell. January 15th, 1925. (245,598.)

1,987. "Automatic switches for use in telephone or like systems." J. E. Pollak (Telephone Apparat Fabrik E. Zwietusch & Co., Ges. Kommanditges.). January 22nd, 1925. (245,606.)

2,594. "Protective device for limiting the supply of current to and automatically switching-off electric current-consuming apparatus." Maschinenfabrik Oerlikon. February 25th, 1924. (230,027.)

3,061. "Automatic switches for use in telephone or like systems." J. E. Pollak (Telephone Apparat Fabrik E. Zwietusch & Co., Ges. Kommanditges.). February 3rd, 1925. (245,615.)

5,239. "Method of and means for operating mechanically-driven rectifiers in connection with electric transformers." Lodge Cottrell, Ltd. (Lurgi Apparatebau Ges.). February 25th, 1925. (Convention date not granted.) (230,073.)

6,402. "Formers for use in the winding of electric inductance coils." Fuller's United Electric Works, Ltd., and A. P. Welch. March 9th, 1925. (245,634.)

6,440. "X-ray tubes." Naamlooze Vennootschap Philips Gloeilampenfabrieken. March 10th, 1924. (230,497.)

6,649. "Coating of welding electrodes." Siemens-Schuckertwerke Ges. March 12th, 1924. (230,831.)

6,675. "Jacketed welding electrodes." P. C. Rushen (Siemens-Schuckertwerke Ges.). March 11th, 1925. (245,635.)

7,089. "Coil-holder for wireless and like apparatus." E. Shipton and B. Phillipson. March 16th, 1925. (245,637.)

11,048. "Automatic electrode-regulating apparatus for electric furnaces." Akt. Ges. Brown, Boveri et Cie. May 7th, 1924. (233,692.)

14,391. "Ignition devices for internal-combustion engines." M. J. B. Barbarou. July 26th, 1924. (237,566.)

14,700. "Flashlight containers." P. R. Puckett. June 5th, 1925. (245,661.)

15,073. "Electrically-operated vacuum cleaners." G. R. Bimm. June 10th, 1925. (245,662.)

17,332. "Electric luminous tubes." General Electric Co., Ltd. February 9th, 1925. (245,672.)

18,573. "Alternating-current induction meters." Dr. O. T. Blathy. August 23rd, 1924. (Addition to 201,573.) (238,863.)

18,601. "Electrical condensers." J. Bate and C. A. Vandervell & Co., Ltd. July 21st, 1925. (245,676.)

19,329. "Combined electrical condensers and resistance units, more especially for use in radio circuits." Dubilier Condenser Co. (1925), Ltd. May 2nd, 1925. (245,680.)

19,845. "Electric flashlights." National Carbon Co., Inc. December 1st, 1924. (243,673.)

20,477. "Device for regulating the pressure of mercury-vapour in the working chamber of mercury-vapour apparatus, and more particularly in mercury-vapour rectifiers." Dr. W. Dallenbach. August 15th, 1924. (238,565.)

26,704. "Diaphragms for telephone instruments." E. V. Mackintosh and C. French. October 24th, 1925. (245,704.)

29,233. "Direct-current ampere-hour meters." G. Wall and Metropolitan-Vickers Electric Co., Ltd. October 18th, 1924. (Cognate application 7,475/25.) (Divided application on 245,536.) (245,707.)

32,798. "Method of and apparatus for converting electric power." P. C. Rushen (Hazeltine Research Corporation). July 4th, 1924. (Divided application on 218,675.) (245,708.)

The

Electrical Review

VOL. XCVIII. FEBRUARY 12, 1926. No. 2,516.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

LIST OF FOREIGN AGENTS (see first page "Official Notices").

The Result of our Competition.

WE have pleasure in announcing below the names of the winners of prizes in the ELECTRICAL REVIEW Advertisement Competition:—

CLASS A.

FIRST PRIZE, £100 - Awarded to Mr. J. L. Hayden (Sells, Ltd.), 168, Fleet Street, London, E.C.4, for the six full-page advertisements of the Macintosh Cable Co., Ltd., Ashbourne Road Mills, Derby.

Two SPECIAL PRIZES of £50 each—

(1) Awarded to the Wandsworth Electrical Manufacturing Co., Ltd., Imperial Works, Ludgate Hill, Birmingham, for six full-page advertisements prepared by Mr. John F. Preston (Messrs. H. P. Pope, Ltd., Advertising Agents).

(2) Awarded to Messrs. A Reyrolle & Co, Ltd., of Hebburn-on-Tyne, for six full-page advertisements.

(These two Special Prizes are additional to those originally offered. The keenness of competitors in the full-page class was so great, and the work so good, that after considering the report of the Judges, the Directors decided to award these extra prizes to the entrants named who ran neck and neck for second place right to the finish.)

CLASS B.

PRIZE, £50—Awarded to Messrs. Evershed and Vignoles, Ltd., Acton Lane Works, London, W. (Advertising Manager, Mr. A. W. Swan), for the best six half-page advertisements.

CLASS C.

PRIZE, £25 Awarded to Mr. J. E. Crawshaw, 28, Deansgate, Manchester, for the best six quarter-pages of the Lea Recorder Co., Ltd.

The number of advertisers who entered for the com-

petition was 45. The judging took place on Thursday, February 4th, at the Hotel Cecil. Messrs. J. W. Beauchamp and L. L. Robinson commenced their very difficult task at 11 a.m., and late in the afternoon on the same day the Electrical Review notified the five winners of their successes by telegram.

All of the submitted advertisements were carefully mounted on stout white cards, and arranged on tables around and in the centre of the well-lighted Pompadour Room.

We reproduce the successful advertisements in a special Art Supplement this week.

The Judges were entirely of one mind in the decisions reached, and the Directors of the Electrical Review, Ltd., desire to acknowledge the debt of deep gratitude to them for so efficiently performing their very difficult duty.

The prizes were duly posted on Friday, February 5th.

We print below the full report of the Judges, and some comments by them appear on page 244 :—

"Electrical Review" Competition.

To the Directors of the Electrical Review, Ltd.

In preparing a report upon our examination of the competing advertisements in the Electrical Review Competition, we hope that it will be recognised that we have experienced considerable difficulty in comparing advertisements of goods of very varying appeal or attractiveness; for example, note the different treatment required for plant, instruments, and accessories respectively. The existence of this difficulty has not, however, prevented us from arriving at quite definite conclusions as to the best series submitted in each of the three Classes.

The entries of the Macintosh Cable Co., Ltd., are recommended for the first prize in the full-page series (Class A). In all the four essential points: power of immediate attraction; qualities compelling continued attention; boldness of design; and artistic arrangement —these advertisements are excellent. They are conspicuous for the way in which they have produced a well-told story on a difficult subject.

The full-page series entered by Messrs. A. Reyrolle and Co. and the Wandsworth Electrical Manufacturing Co., Ltd., respectively, admirably execute the same difficult task, and we select them as being of equal merit and deserving of special recognition. Other competitors produced excellent examples of the purely technical advertisement in attractive form; one was noteworthy for its determination to attain to "truth in advertising" by modestly claiming to be only "very nearly perfect"; others made good use of the readiness with which plant lends itself to effective display.

In Class B (half-pages) we recommend as the best series those submitted by Messrs. Evershed & Vignoles, Ltd. In respect of design these advertisements compel attention. They make good use of the house outline around the Megger; also of the chart behind the recorder; and of the worry of a man who kept no records. They also get home well with the argument about the security which is assured by the use of reliable instruments.

Turning now to Class C (quarter-page), we recommend the series of the Lea Recorder Co., Ltd. for the prize. In the small space at the designer's disposal there is necessarily less opportunity for him to bring the same compelling force to bear upon the reader's mind. The presence of other announcements also has a weakening effect, but the quarter-page space in this series is, in our opinion, availed of to the fullest possible extent. Note how the direct question put to the reader-buyer is one always uppermost in his mind. The interest having thus been aroused, is well maintained. We especially commend the effective use that is made of diagrams. Though in point of boldness the series may not be all that the subject deserves, the limited space is well used.

Among the other examples included in Class 3, there were some which, while they compelled attention through boldness of design and directness of appeal, lacked certain other essentials. Some compelled attention, but did not maintain interest or excite further inquiry; some had no "story" to tell, or the story told was on the dull side.

The competition has, in our opinion, given a stimulus to the desire of advertisers and designers to produce work of a high standard. As the result of our examination of the 270 examples that were submitted by 45 companies and firms we feel that we must congratulate British advertisers upon the advance that they have made, for we believe it to be perfectly true that in the normal weekly issues of trade journals, either in this country or in America, there is no better advertising matter than has been brought together in this collection of announcements published in the Electrical Review between July and December, 1925.

We have been greatly impressed with the value of the whole-page advertisement as a means of fixing the reader's attention and affording the designer full scope for the exercise of his ingenuity and skill in effectively telling his story and illustrating the goods.

J. W. Beauchamp.
February 4th, 1926. L. L. Robinson.

Go to Birmingham!

Everything in regard to the future place of electrical products at the British Industries Fair depends upon the measure of success that attends our operations at Birmingham during the twelve days commencing on Monday next. The seventy or eighty exhibits that are now being prepared should make a powerful impression on the minds of the large number of visitors who are expected from overseas; and the collection of electrical articles brought together should make an atmosphere in which trade relations between home buyers and our firms should receive an excellent stimulus. The principal electrical day will be Wednesday next, 17th inst., when we hope there will be a large gathering of electrical men who have the ordering or specifying of goods. On other days delegations from electrical contracting and wholesale trading concerns will be present. We wish all exhibitors a very busy time, and urge all our readers who can manage to do so, to spend at any rate one day at Birmingham before February 26th.

The Lighting of Coal Mines.

The discussion on the above subject before the Illuminating Engineering Society on January 21st (reported elsewhere in this issue) was opportune, and raised many interesting points. Many data have been presented at different times to show the good results that have attended the introduction of improved electric lamps. It was, therefore, diquieting to note from Dr. T. L. Llewellyn's contribution that, in spite of these and other improvements in lighting, both nystagmus and cases of disability seem to have increased during recent years. This problem, like many others, is complicated by other considerations that tend to mask the effects of better lighting. The deranged condition of the industry accounts for a good deal, but in the meantime there are circumstances which have prevented the full advantages of electric lighting from being realised. Mr. E. Farmer, in his introductory paper, drew attention to one, namely, the tendency of naked filaments to glare when seen amidst the dark surroundings of the mine. Frosting the inside of the glass cylinder would seem to be a palliative, even though it causes some diminution in light. Another fact, commented on by Mr. T. J. Sack and others, is that a life of 1,000 hours, often demanded by colliery owners, cannot be expected from a miniature 2-volt lamp of reasonable efficiency; hence, underrun lamps, often furnishing even less than the legal minimum of 1 candle-power, are in use. It would pay handsomely to adopt lamps of a shorter life, but run at a higher efficiency, and there is also good prospect that miners will ultimately consent to use a somewhat heavier lamp, enabling 4-volt batteries to be employed and a higher candle-power obtained. In this event

gasfilled lamps may ultimately be used. Finally, there is the possibility, suggested by Prof. W. Thornton's researches, that low-voltage high-frequency currents, supplied by special cables, may eventually enable ordinary systems of electric lighting to be more widely installed in mines.

Railways and Rural Electrification.

WE referred in the closing paragraph of our leader of January 22nd to the electrification of the railways as an alternative method of carrying electricity supply into the country. There is not a centre of population in the whole country which is not within reasonable distance of a railway station. Consequently, if the whole of the railways were electrified, the whole of the country could be given a supply of electricity. That is a consummation attainable only after very many years; but the same is true of the method contemplated by the Government. Now, it is known that the railway companies are interested in the problem of electrification, and we have recently been told by more than one of their leading representatives that if it could be shown that electrification would pay, then they would be ready to adopt it. The companies are at present spending very many millions a year on new steam locomotives, rolling stock, and permanent way, which might equally be expended on electric locomotives and other electrical equipment. The North-Eastern Railway went so far as to build an electric main-line locomotive, and seriously considered the conversion of a large portion of its system to electrical operation. It appears, therefore, that the margin between profit and loss due to electrification is but a narrow one. It is worth consideration whether, if a portion of the capital scheduled for the Government scheme were devoted to the elimination of that margin, the electrification of our main-line railways and the concurrent electrification of the whole country might be brought about most economically and with the most beneficial results.

The point is that there is no necessity to find the whole of the enormous capital required to convert all our railways to electrical operation; a certain outlay would be justifiable on a strictly commercial basis, and up to that point the railway companies would be prepared to go, if there is any meaning in words. The additional capital required would be the difference between that amount and the actual cost, and if it were provided on similar terms to those offered to the proposed Executive Board—that is, with a Trade Facilities guarantee, and with sinking-fund suspended for five years—it would not only be readily obtainable, but would, we think, be at least as likely to become remunerative as the capital required for the national network and the standardisation of frequency. At the same time the combination of the railway load with that of public supply for lighting and power would greatly improve the load factor and enable the cost of energy to be reduced to a figure acceptable to the railway companies.

Unusual Dangers.

THE report which appeared in our last issue of a fatal accident due to a shock from the uninsulated collar of a lamp draws attention to a danger attendant upon the use of the screw-cap type of lamp which perhaps has not received sufficient consideration. It was stated that the unfortunate victim was altering the position of a high-power pendant lamp of this type whilst the cap of the lamp was alive; apparently, he received a shock of 230 volts alternating between the lamp cap and a steel girder, which ended fatally.

Even if such circuits were always wired with the switch on the live side, the danger would not be wholly removed, as it might be possible for a break to occur on the earthed side of the circuit, leaving the lamp cap charged through the filament. But even if this were not the case, no reliance could be placed on the wiring of the lampholder so that the lamp cap was on the earthed side, because at any time alterations might be made nullifying this precaution; it is also possible for the polarity of a whole installation to be reversed when work is in progress on the public mains. In the case of private self-contained installations neither pole may be earthed, and yet a fatal shock may conceivably be received from such a fitting.

Whilst we deprecate an alarmist policy where the risk is negligible, we think it must be recognised that there is a real danger to be dealt with here, and that provision should be made to prevent the recurrence of such an accident if possible—the most obvious course being to cover the exposed metal with an insulating coating.

A fatality recorded in our last issue, presumably due to contact with a radiator which had become "alive," is another example of those accidents in the bathroom which, more than any other class of accident, have marred the use of electricity in the home. Only in the bathroom, scullery or wash-house, and cellar is it normally possible, within reason, to bring about a fatal accident in the household, and, as we have repeatedly urged, the greatest care should be taken to limit the risk in such localities to the minimum. Portable apparatus should never be used in a bathroom.

Unfortunately electrical engineers have thought fit to impose the same precautions upon the use of electricity in other parts of a house where the risk is, humanly speaking, negligible. It is impossible to eliminate every conceivable element of risk in the use of electricity, any more than that of gas, coal, coke, oil, or even water. Who would ever have imagined that putting a pair of slippers under a radiator would bring about the death of the owner?

Interconnected Power Systems.

AN interesting article recently appeared in the *Electrical World*, of which an abstract is printed elsewhere in this issue, describing the methods adopted by a large electricity supply undertaking in the United States to obtain the advantages of interconnection between four power stations, without the drawbacks consequent upon the massing of plant aggregating 500,000 kW.

If the system were solidly linked up, the occurrence of a fault on any part of it would result in the discharge of an immense amount of energy into the fault, setting up a violent disturbance throughout the system. To obviate this, the "loose-linking" method has been employed, enabling the stations to assist one another when necessary or desirable, but limiting the effects of an uncontrollable disturbance to the minimum area. This end is attained, as explained in the article, by limiting the number of points at which energy may pass from one area to another, and by providing adequate automatic switchgear at each of these points. The installation of heavy switchgear at the power stations is being avoided as far as possible.

Wholesalers and Contractors.

THE general theme of the speeches at last week's dinner of the Electrical Wholesalers' Federation, which are reported in this issue, was an apprehension of the Government's intentions so far as the wiring of premises and the sale of electrical appliances are concerned. There appears to be a feeling that the Government intends to encourage municipal authorities to apply for full trading powers, and this fear may not be entirely without reason having regard to the decision in the Barrow, Bath and Burnley Corporations' Bills last July. Through Mr. A. G. Beaver, the Electrical Wholesalers' Federation expressed its determination to support the Electrical Contractors' Association in its fight against the granting of these powers, and at the same time Mr. Beaver warned manufacturers that it was not in their interest to adopt a neutral attitude. The contractors intend to get their blow in first if they can; the first manifestation of this spirit is the publication of a pamphlet, "Electrical Freedom," which is mentioned in our Business Notes.

The "Electrical Review" Advertisement Competition.

By J. W. BEAUCHAMP and L. L. ROBINSON.

In this competition there were examples of the modern advertising method in which a particular article is illustrated and supported by some decoration or sketch illustrating the idea for which it stands or work which it accomplishes.

This method is good, but in some of the examples the supporting ideas rather overshadow the actual article being sold, that is to say, the advertising agent or designer has become too much obsessed by his advertising technique, thus losing sight of the real object—to sell a certain article.

This is often noticeable to-day in the work of some agents.

It is seen again in poster work; the advertisers get so pleased with the fineness of their poster work that they produce something more likely to be appreciated by their brother advertising agents than by the public to which it is really addressed. The object and the supporting atmosphere should carefully be kept in their respective places.

We were impressed with the very high quality of all the stuff sent in, particularly the full-page spreads. Much of the best of the American advertising work was really embodied in these advertisements without making them too blatant and noisy.

In judging, a difficulty arose in comparing advertisements for heavy plant, highly scientific instruments and ordinary accessories. It would be easier if the advertisements were divided into classes.

It requires far more imagination to make a really telling advertisement out of some simple material or accessory than out of high-grade plant which lends itself naturally to effective pictorial treatment.

Some of the advertisements were very good because they were an appeal from a manufacturer to a retailer and pointed out how the retailer could make money by handling such goods.

Advertisements from the manufacturer to the retailer must go a little further than selling to the retailer, which after all is only half a sale—they should suggest how the retailer can "re-talk" the story to the ultimate user, or at least recommend him to get from the manufacturer some further leaflet or information on this very important point. Goods sold by manufacturers to retailers are really only half sold.

Some of the advertisements were a very happy combination of popular appeal and technical information—there is room for this sort of work in our industry; it not only sells the goods but also acts as a sort of unconscious text-book towards the buyer, increasing his technical knowledge in an easy way; as the suction cleaner says "It beats as it sweeps," we should say "The advertisement teaches as it sells."

In some cases the advertiser has forgotten that the reader of the technical paper is a busy man—or at least it is the busy reader who is a buyer. As he turns over the leaves, dozens of them, some feature must be provided to arrest his attention before consideration is given to the message which he is to read but will not read unless some outstanding feature has made him pause for a moment on that page. Here is the great advantage of the full page.

A few of the advertisements had a "carrying on" feature, they left rather a feeling that one should look for the next issue from the advertisers (this is important) or that one should write immediately for fuller details—the latter feeling is very important if it can be created, because if the writer immediately writes for something the seller gets his name on his file in connection with a certain subject, and then has all the material for follow-up work.

Few manufacturers perhaps expect to get a definite order right away from a particular advertisement, but if they can extract a letter from the potential buyer and so "start a file" with him, the rest should be easy. The seller then has a definite avenue of approach for his written matter and for his travellers.

The judges were glad that there was only one prize offered in each class; there was no real difficulty after serious consideration in adjudging the one first prize in each class, but it would have been very difficult to discriminate between Nos. 2, 3, and 4 had there been more prizes than one. The whole standard of the first half dozen in each class was very high.

Generally it was encouraging to note the absence of mere "superlatives" in the advertising, and the general expression of care and thought given to combine some arresting feature or statement with definite and valuable information as against the shrieking methods with which we were at one time threatened in engineering advertising.

The most interesting were those cases where a very scientific article or simple material, rather difficult to make a story with, had been treated.

Some of these less dramatic accessories or materials are of the utmost importance in electrical advertisements, and it is worth while bearing in mind that the firm that succeeds in putting across, for example, simple systems of wiring, good fittings, and things of that kind, is in a way advertising for all the other firms, much as E.D.A. by pushing electricity generally helps to sell dynamos, measuring instruments, and so on.

The almost entire absence of very noisy or rather vulgar advertisements was most encouraging—this class of thing may make people gape, but it sells nothing and lets down the standard of the whole business; the heroic figures, and more or less nude ladies and complicated sketches can safely be left to sellers of patent foods and similar articles.

Similarly, with the wording: "clichés," rhymed lines, and devices of that kind are no good in our business.

Copy should be terse, based on knowledge of the goods and belief in their utility. This, coupled with some imagination, placing the advertiser in the buyer's mental position, is most likely to produce results, and, generally speaking, the advertisements put before us represented this rather high-class, serious advertisement treatment in a very satisfactory manner.

Electricity in Agriculture.—After an extensive tour of America and Europe, Mr. H. P. Colwell, chief electrical engineer of the Victorian Railways, on returning to Australia in December is reported by the *Sydney Morning Herald* to have said that the rapid application of electricity to railways, industry, and agriculture in Europe had surprised him. 'During the war the price of British coal advanced to a prohibitive extent, and many European countries applied electricity to industries formerly dependent upon coal. Some of the farming districts, particularly those of Sweden, were remarkably well equipped with electrically-operated machinery, and he had seen consignments of electric ploughs sent from Germany to Russia. Where it was practicable to plough huge areas of land in one locality, the country was reticulated with electric cables, and ploughs were harnessed to electric tractors.

Hydro-Electric Enterprise in Canada.—During 1925 a total of 719,000 h.p. was added to the hydro-electric generating capacity of Canadian installations, bringing the total now operative to 4,290,000 h.p. Last year's installations represent a direct capital investment of $70,000,000, without regard to the new capital required to utilise the power. A further 1,000,000 h.p. at least is expected to be added during the current year. Quebec led in 1925 with a total of 439,000 h.p. in new installations; Ontario was second with 200,000 h.p., and British Columbia third with 59,000 h.p.—*Reuter's Trade Service* (Ottawa).

The British Industries Fair—I.

Electrical Features and Meetings.

On Monday next a trade event of the first importance commences simultaneously at London and Birmingham. It is natural to place London first, but from the point of view of the electrical industry that section of the British Industries Fair will be overshadowed by Birmingham.

As our readers know, special efforts have been directed towards the building up of a really representative electrical section at the Castle Bromwich Aerodrome, in which spacious buildings the Fair is housed. These efforts have borne abundant fruit; the list of exhibitors includes between 70 and 80 firms which are wholly or mainly electrical, and among them are the names of most of the leading concerns of the industry. We think, therefore, that electrical manufacturers will be represented in a manner fitted to their importance in the economic life of the State, and it is our earnest hope that the results obtained by them will more than justify their participation in this great trade show, which, it is hoped, will one day threaten the supremacy of Leipzig.

The Fair is designed, in the first place, to show foreign buyers what this country's capabilities are, and the whole of the organisation of the Department of Overseas Trade, and the Consular and Diplomatic Services, have, for the past few months, been spreading the idea and inducing traders in all parts of the world to visit England this year. Over 200,000 invitations have been issued to buyers in the Dominions and foreign countries, and to each two letters have been sent in his own language in the case of European and Latin-American countries. It may be of interest to mention actual figures; the following is a selection from an official list giving the country and number of buyers invited:—Australia and New Zealand, 2,000; Canada and Newfoundland, 2,168; South Africa, 2,256; Argentina, 1,145; Norway, 1,081; Sweden, 1,126; Holland, 1,600; the United States, 5,000; France, 2,892; Spain, 1,600; Italy, 3,000; Switzerland, 2,264; Balkan States, 1,000; and the Middle East, 1,000. It will be seen from this that every endeavour has been made to attract visitors from all the important markets, and the Department of Overseas Trade reports that the organisation of the Fair has received a remarkable response from representative buyers throughout the world. The opening of the Fair is thus taking place in most propitious circumstances, and everything points to success.

We have so far said nothing of the London section of the Fair. While, from our own point of view, this is of considerably smaller importance, it is by no means negligible. The radio industry is putting up a good show, there being a separate section for this purpose in which 33 firms have taken space. Having regard to the progress which the industry has made in the last year or two, there is no doubt that it now constitutes a very important branch of British production, and should secure a good share in foreign markets. Apart from the radio section, however, there will be many exhibits of electrical novelties and small electrical appliances at the White City, all of which play their part in the inculcation of the "electrical idea" and lead to bigger things.

The London list includes a number of the leading firms of radio apparatus makers, including the General Electric Co., Ltd., the British Thomson-Houston Co., Ltd., Burndept Wireless, Ltd., the M.O. Valve Co., Ltd., Marconi's Wireless Telegraph Co., Ltd., the Mullard Wireless Service Co., Ltd., the Marconiphone Co., Ltd., and S. G. Brown, Ltd., apart from a number of other firms which, although not so well known, do a tremendous business in radio apparatus.

The value of the Fair is to be enhanced by the seizing of the opportunity to bring together at the exhibition a number of trade associations and groups. We have already mentioned one or two functions which have been arranged, but we think that a brief *résumé* of the programme drawn up for the Birmingham section may be of interest and use to our readers. On Monday next (February 15th) the Lord Mayor of Birmingham will officially open the Fair, and on the following day the chief magistrates of other industrial towns will pay a visit at the Lord Mayor's invitation. On the same day (February 16th) an official visit will be paid by the Birmingham Association of Building Trades Employers. Wednesday, February 17th, is an "electrical" day, when a number of associations representative of associations in all branches of the industry will attend the Fair. Among the bodies who have notified their intention of taking part are the Institution of Electrical Engineers, the Incorporated Municipal Electrical Association, the Association of Mining Electrical Engineers, the Provincial Electric Supply Committee of the United Kingdom, and the Association of Electric Power Companies (Inc.). On February 18th official visits are being made by the Midland Builders' Federation and the Ironmongers' Federated Association, while there will also be a conference of Midland Gas Departments. The Duke of York will be at the Fair on February 19th, and on the same day the Sheffield Chamber of Commerce will pay an official visit.

On February 23rd official visits are to be paid by the National Hardware Association, the Export Merchants' Section of the Chamber of Commerce, the Ironmongers' Federated Council, and the Electrical Association for Women. Wednesday, February 22nd, is another "electrical" day, when the principal officers and local branch secretaries of the Electrical Contractors' Association will inspect the exhibits. The President and Council of the Electrical Wholesalers' Federation will be there, and the Birmingham and District Master House Painters' Association will also pay an official visit. The last official visit in the programme is that of the Liverpool Chamber of Commerce on February 25th. The Fair closes on February 26th.

In London an important banquet will take place on the evening of the opening day. The Mansion House has been lent by the Lord Mayor for the occasion, the President of the Board of Trade will preside, and the Prince of Wales will be the principal guest.

From the above list of functions it will be seen that while the foreign markets have been intensively cultivated, our all-important home market is also to be fostered by the visits of a number of representative bodies of users of manufactured products, as well as exporters who are an indispensable link in the chain of foreign trade relations.

The Birmingham Corporation is also rendering active assistance in the organisation of the Fair. It will be appreciated that the power supply to such a large aggregation of exhibits and arrangements requires very special attention, and the Corporation Electric Supply Department has carried out the work well. The Corporation has also taken a large amount of space as an exhibitor. The Electric Supply Department is to have a display exemplifying the use of electricity in a number of diverse directions. The principal exhibit will be a 184-kW mercury-arc rectifier sub-station. This is of the type employed in outlying areas to convert 25-cycle a.c. at 5,000 V to d.c. at 220 and 440 V. A transformer sub-station, as installed on the premises of large consumers, is also to be shown. This type consists of a 100-kVA transformer with the necessary h. and l.p. switchgear, to step-down the pressure from 5,000 V to 440 V three-phase and 110 single phase. Other exhibits will be electric furnaces, a coal-cutter, static condensers, bench drills, &c.

Electricity Supply in Great Britain.—XI.*

Lincoln, Rutland, Norfolk, and Suffolk.

The above Counties (except such parts of Lincolnshire as are included in the North-East Midlands provisionally determined Electricity District), together with the Counties of Cambridge, Isle of Ely, Huntingdon, Soke of Peterborough, and such parts of Essex as are not included in the London and Home Counties Electricity District, form Area No. 18 of the Fuel Consumption Analyses Report of the Electricity Commissioners, published annually by H.M. Stationery Office (price 1s. 6d.).

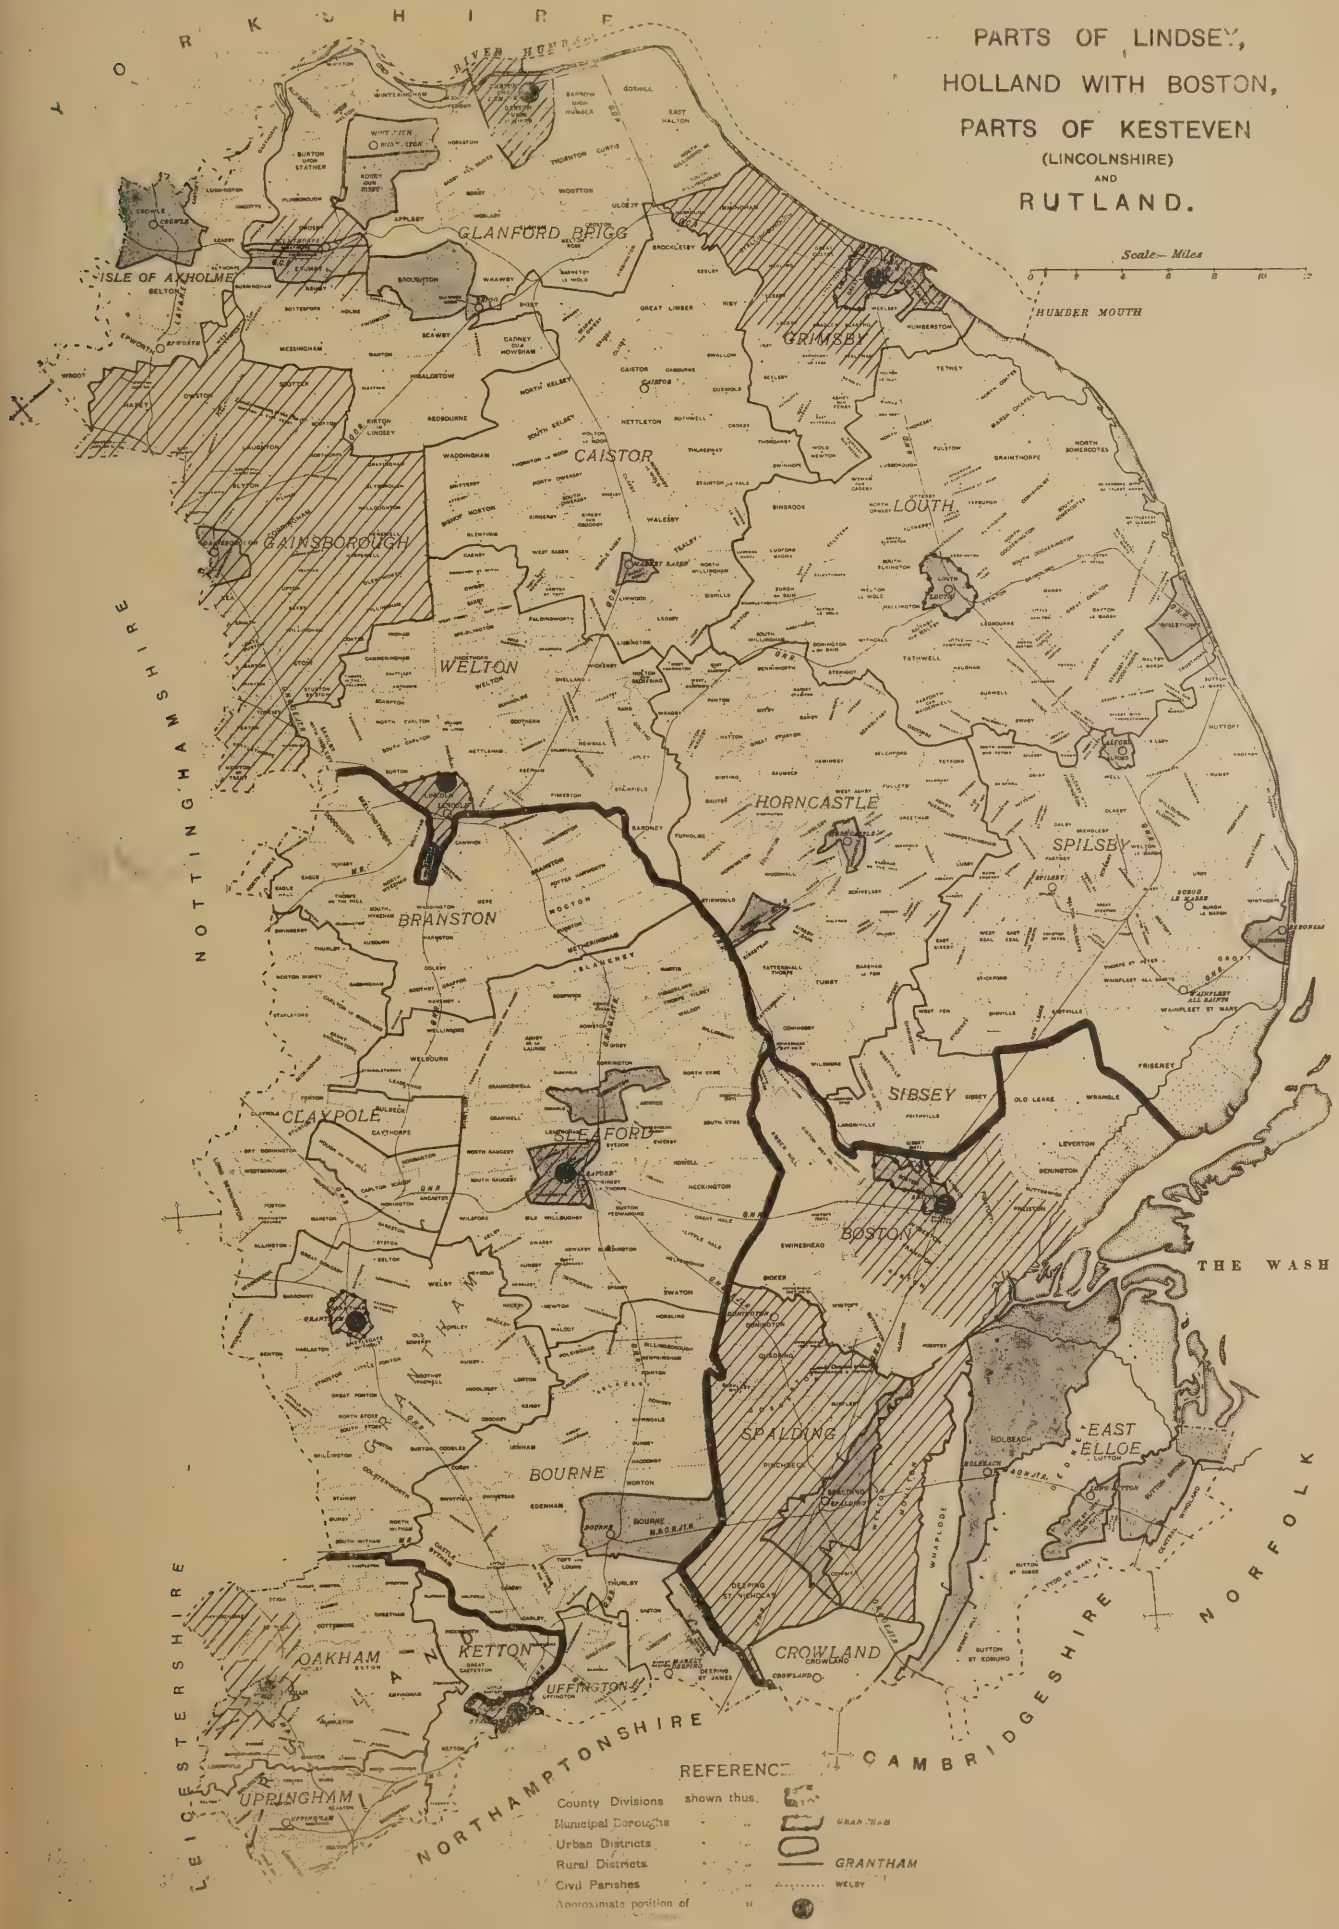
Table 8 gives the following totals for this Area :—

Year ending 31st March.	Area No. 18. kWh generated.
1922	72,728,485
1923	90,663,814
1924	107,370,713
1925	121,939,441

These figures include the kWh generated by Peterborough Corporation, Cambridge E.S. Co., Ltd., Wisbech E.L. & P. Co., Ltd., and by the undertakers in Essex outside the London and Home Counties' Electricity District, as well as the kWh generated at the stations shown on the accompanying maps.

The County of Essex was reproduced in No. 3 of this series, and the Soke of Peterborough was included in the map which accompanied the first of the series. With regard to the Counties of Cambridge, Huntingdon, and the Isle of Ely, it is not proposed to publish the maps, as the whole area is being applied for by the promoters of the Bedfordshire, Cambridgeshire, and Huntingdonshire Electric Power Bill.

The following is the list of existing authorised



Electricity Supply in Norfolk and Suffolk.

*Parts I-X of this series appeared in the Electrical Review of October 9th, 16th, 23rd, and 30th, November 13th and 20th, December 11th and 25th, 1925, and January 15th and 29th, 1926.

undertakers, whose areas are shown hatched on the accompanying maps:—

Local Authorities.

Bury St. Edmunds Corporation.
Cleethorpes Urban District Council.
Felixstowe Urban District Council (undertaking operated by a company).
Great Yarmouth Corporation.
Grimsby Corporation.
Ipswich Corporation.
King's Lynn Corporation.
Lincoln Corporation.
Lowestoft Corporation.
Norwich Corporation.
Scunthorpe and Frodingham U.D.C.
Sleaford Urban District Council.

Electricity Supply in Lincolnshire and Rutland.

Companies.

Aldeburgh Electric Supply Co., Ltd.
Barton-on-Humber Electric Supply Co., Ltd.
Boston and District Electric Supply Co., Ltd.
Brundall and District Service Co., Ltd.
Edmundsons Electricity Corporation, Ltd.
Newmarket Electric Light Co., Ltd.
Oakham Gas and Electricity Co., Ltd.
Sheringham and District Electricity Supply Co., Ltd.
Urban Electric Supply Co., Ltd.
Woodbridge and District Electric Light Co., Ltd.

Cleethorpes Urban District Council obtains a bulk supply from the Great Grimsby Street Tramways Company, and Scunthorpe and Frodingham Urban District Council purchases its supply from a private company.

The Urban Electric Supply Co., Ltd., has separate undertakings, each with its own generating station, at Grantham and Stamford. Norwich Corporation is supplying in bulk to the Brundall and District Service Co., Ltd., and the Sheringham and District Electricity Supply Co., Ltd., is arranging to take a bulk supply from Edmundsons' generating station at Cromer.

The remaining undertakers possess their own generating stations, as indicated on the maps. It will be seen that there is no Power Company included in the above list of undertakers, and at the present time no part of the area of either map comes within any Power Company's territory, although part of north-west Lincolnshire is included in the North-East Midlands Electricity District as provisionally determined by the Electricity Commissioners. The areas applied for have also been hatched on the maps; the names of the promoters concerned are as follows:—

East Anglian Electricity, Ltd.
Orford Electric Light and Power Co., Ltd.
Spalding Urban District Council.
East Dereham Urban District Council.
Gainsborough Urban District Council.
Bungay Urban District Council.
Nottingham Corporation (Extension).

Particulars of applications are given in the Electricity Commissioners' Annual Reports and in the *London Gazette*.

The 1921 Census gives the following particulars for the districts shown on the accompanying maps:—

Administrative County with associated County Boroughs.	Acres.	Persons.	Resident families.	Buildings not containing dwellings.
Lincolnshire, Parts of—				
Holland ...	263,120	85,254	20,434	1,570
Kesteven ...	469,377	108,250	25,823	2,175
Lindsey ...	972,796	408,698	95,148	8,723
Rutland ...	97,273	18,376	4,531	369
Norfolk ...	1,315,064	504,293	121,783	8,747
Suffolk, E. ...	557,353	291,073	67,912	4,484
Suffolk, W. ...	390,916	108,985	27,570	2,053
Total ...	4,065,899	1,524,929	363,201	28,121

Similar particulars for the Administrative Counties of Cambridge, Huntingdon and the Isle of Ely give the following totals:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
787,226	258,160	64,090	4,762

These maps are reproduced by permission of the Controller of H.M. Stationery Office. The originals were prepared by the Ordnance Survey Department for the 1917 Boundary Commission.

Since 1917 the following alterations to areas, &c., have been made:—

(1) The Urban District and Parish of Scunthorpe and Frodingham has been created by uniting parts of the Parishes of Appleby, Ashby, Crosby, and Flixborough, and parts of the Urban Districts and Parishes of Brumby and Frodingham and Scunthorpe. The remainder of the Parish of Ashby was transferred to the Parish of Burringham, the remainder of the Parish of Crosby to the Parish of Flixborough, and the remainder of the Parishes of Scunthorpe, Brumby and Frodingham were united to form the Parish of Brumby Rural.

(2) The Borough and Parish of Lowestoft has been extended so as to include the Urban District and Parish of Oulton Broad.

(3) The City and County Borough and Parish of Lincoln has been extended so as to include the Urban District and Parish of Bracebridge, the Parish of Boultham, and parts of the Parishes of Bracebridge Heath, North Hykeham, and Skellingthorpe.

(4) Parts of the Parishes of Humberston and Weelsby have been transferred to the Urban District and Parish of Cleethorpes, and a part of the latter has been transferred to the Parish of Weelsby.

(5) The Urban District of Broughton has been abolished, and the Parish of Broughton has been included in the Rural District of Glanford Brigg.

(6) The Parishes of Thetford Saint Cuthbert, Thetford Saint Mary, and Thetford Saint Peter have been united to form the new Parish of Thetford, co-extensive with the Borough.

(7) The Urban District of Mablethorpe has been extended so as to include the Parishes of Trusthorpe and Sutton-le-Marsh. The name of the extended Urban District has been altered to the Mablethorpe and Sutton Urban District.

(8) The Parishes of Saxlingham Nethergate and Saxlingham Thorpe have been united to form the new Parish of Saxlingham Nethergate.

(9) Part of the Parish of Heacham has been transferred to the Urban District and Parish of New Hunstanton.

(10) Parts of the Parish of Gosberton have been transferred to the Parishes of Surfleet and Quadring; and parts of the Parishes of Surfleet and Quadring have been transferred to the Parish of Gosberton.

Wave Power Utilisation.

Brief Particulars of a Bulgarian Experiment.

In view of the efforts that have been made for many years past to devise some practical means—both from the point of view of economy and efficiency—of utilising the power of the tides for the generation of electricity, it is interesting to learn that some trials are at present being carried out at Varna, on the Black Sea, by a Bulgarian engineer named Athanas Vodenitcharoff, with a machine which he has devised. The engineer in question has been at work on the subject for the past thirteen years, during which period tests have been made with many different forms of wave-utilisation motors. The sixth device of the kind, installed at the breakwater of the Black Sea port of Bourgas in 1924, gave such promising results that M. Vodenitcharoff was

Fig. 1.—Wave Power Plant at Varna.

at last successful in securing the interest of a group of financiers who, early in 1925, organised the Syndicat pour Utilisation des Vagues Marines par le Moteur "Ouragan," with offices in Sliven, Varna, and Sofia. With the assistance and under the auspices of the Syndicate, M. Vodenitcharoff is now putting the finishing touches to a larger and more ambitious installation at Varna, of which we are able to reproduce a couple of photographs.

Owing to the question of patents in the different countries having still to be settled, it is not possible to publish full details of the arrangement adopted. From the particulars we have been able to obtain and from

the illustrations, however, we gather that the installation comprises a staging of iron or ferro-concrete construction, a series of floating elements which the inventor terms "power centralisators," a receiver and transmitter, with counterpoise, of the horizontal movements of the waves, a corresponding receiver and transmitter of the vertical movements, mechanism for converting the horizontal and vertical movements into rotary motion, an accelerator, flywheel, and adjusting gear, together with supplementary gear such as automatic pumps, dynamos, transformers, accumulators, &c.

M. Vodenitcharoff, who in the Bourgas experiment demonstrated his ability to provide electric lighting and power from the waves by a small motor which is now to be seen in the Marine Museum at Varna, claims that the success he has achieved is due to the fact that the Ouragan motor utilises four distinct movements of one and the same wave, *viz.*, the moment of rise on the advance of the wave, (2) the moment of descent of the floating member or power centralisator on the passage of the wave, (3) the moment of the horizontal stroke of the wave irrespective of its direction, and (4) the moment of return of the floating member on the passage of the wave. The experiments at Varna are being watched with great interest by Bulgarians from the King downwards. A provisional British patent has, we understand, already been applied for.

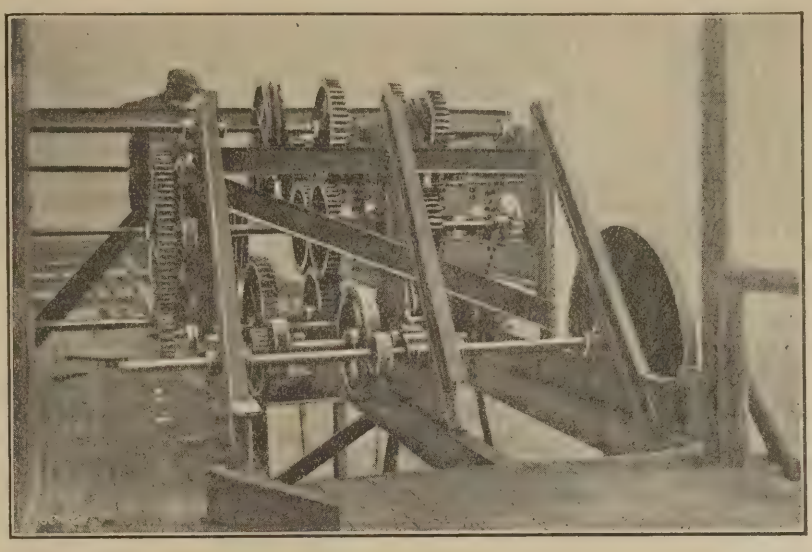


Fig. 2.—Gearing of Wave-operated Motor.

Boiler-Room Practice.

Coal Flow, Air Flow, and Steam Flow.

By JOHN BRUCE.

ONE of the most desirable features of modern boiler-house operation is the facility to readily determine, or express in such a manner as to be easily understood by all the boiler-room operatives, the instantaneous efficiency of conversion of the potential heat energy in the coal entering the boiler furnaces of any individual boiler unit.

While it is now generally recognised that a boiler plant can only be efficiently and scientifically operated from the interpretation of certain data, recorded or indicated by modern boiler-room instruments, it may be found that even with a comprehensive instrument equipment, only a trained combustion engineer can make the interpretations necessary to state the efficiency of conversion at a particular moment. An instrument panel equipped with a multiplicity of temperature indicators, draught gauges, CO_2 recorders, and steam and water flow meters, may easily prove the reverse of helpful to the average operator in the modern boiler room. Instead of facilitating the operation of coal-consuming equipment purposely installed to save coal, the complexity of instruments and the difficulty to the average operator of reconciling the various indications results in inefficient operation; the instrument equipment and the operator are condemned, and the boiler room becomes the sepulchre of possibly half a dozen different instrument makers' productions.

When deciding the equipment to be mounted on a boiler unit instrument panel, the average engineer is inclined to forget the fireman's or boiler operator's limitations, especially if the allowance for instruments permits a certain prodigality in this direction.

It is admitted that the day of muscle and brawn as recommendations for a boiler-room job are over, and that a different type of man, in whom intellect is looked for as a predominating feature, is being attracted to this section of power station work.

This new type of boiler-room operator, while certainly prepared to operate the plant in his charge to a combustion engineer's instructions or from instrument indications and the physical appearance of his fires, has still one thing in common with his predecessor, and that is the natural desire for simple, easily read, and easily understood gauges. The average fireman of ten or twenty years ago was content with the B.O.T. standard fittings for indicating steam pressure and water level, and the measure of his efficiency was very often based on the tonnage handled by his shovel and his ability to keep the needle of the pressure gauge on the "mark."

The modern type of fireman, or rather boiler attendant, asks that the modern "efficiency" instruments with which his boiler plant is equipped shall be few in number, easily read, and easily understood; and, instead of having to reconcile a dozen different indications, it should be possible for him to tell, from one or a combination of two indications, that the conditions under which the unit is being operated are consistent with maximum efficiency and economy. The ideal of one instrument or gauge as an indicator of overall boiler unit efficiency is not so Utopian as at first sight appears, and in this article it is proposed to discuss in particular the combination of measurements necessary to give this information.

In previous articles dealing with boiler-plant operation it has been pointed out that if comprehensive records of operation are to be made, the instrument equipment must necessarily be capable of providing all the data involved in the tabulation of a heat balance statement. It does not, however, follow that the plant could not be operated equally efficiently with fewer instruments, provided that such instruments give all the information necessary for the control of the variable factors influencing minute to minute operation.

The function of any steam boiler is the absorption of heat liberated from the combustion of fuel in a specially

designed furnace, the heat absorbed by the boiler being finally transmitted, by conduction and convection, to the water and steam contained therein. The performance, or efficiency, of the complete process is then the ratio of the heat units carried by the steam from the boiler (as the result of the combustion of unit weight of fuel) to that available for absorption as represented by the potential heat units contained in the same unit weight of fuel. The modern boiler unit for the generation of steam produced from the heat liberated by the combustion of coal may consist of a combination of the following components:—

(1) A furnace for the combustion of coal, designed and arranged to ensure that the heat liberated will be produced and presented to the heating surfaces of the boiler in the most efficient manner.

(2) A boiler, or water container, arranged in such a manner relative to the furnace that the heat presented by the furnace will be absorbed by the water rapidly and efficiently.

(3) A steam superheater, usually arranged as an integral part of the boiler, and designed to absorb heat by the heat-carrying medium, additional to the heat already absorbed by the water.

(4) An economiser, or in other words, feed-water heater, usually designed and arranged as part of the boiler unit total heating surface, its function being the absorption of heat from the gases of combustion after the latter have left the heating surfaces of the boiler. The heat thus absorbed is taken up by the water on its way to the boiler.

(5) An air heater designed and arranged as a component part of the combined boiler unit. The function of the air heater is the absorption of heat from the gases of combustion after these gases have left the heating surfaces of the economiser or boiler.

If the foregoing components of a boiler unit are arranged in the order stated, the air heater reduces the gases of combustion to the final temperature at which they will be discharged to the stack and atmosphere.

The heat absorbed by the air heater is taken up and carried by the air being supplied for the process of combustion of the fuel, thus reducing the endothermic work of the furnace, and diverting the commencement of the thermal cycle to a point in the path of the waste gases.

While the foregoing combination of equipment has been stated as representative of modern boiler-room practice, it should be pointed out that certain variations exist with relation to items 4 and 5.

Air heaters have not yet been widely adopted, and where they are installed it is not always in combination with a water economiser.

The operation and the resultant performance of a boiler unit consisting of the various combinations of equipment described are governed by certain factors over which the operating engineer should have perfect control. These factors have been discussed at length in previous articles, and for the present purpose we need only consider them briefly here.

On the assumption that the separate components of a boiler unit are correctly designed and so arranged in relation to each other that with the correct operating conditions the resultant performance will represent maximum attainable efficiency, and that the whole of the unit is in first-class mechanical condition, it can be shown that the overall performance is, practically, entirely dominated by the performance of the furnace.

The duty of the furnace, which term includes the combustion chamber and setting, is the liberation of heat units from the combustion of the coal and the efficient presentation of these liberated heat units for their rapid absorption by the other components of the unit.

The performance of any correctly designed and erected stoker and setting, as far as combustion efficiency is concerned, is, generally speaking, governed by two variable factors. These two factors are:—(1) rate of coal flow, (2) relative rate of air flow. These two variables result in one factor, rate of liberation of heat units.

The function of the heat absorbing components of the unit is the rapid absorption of the liberated heat units, and again assuming correct design and setting and cleanliness of internal and external heat transmitting surfaces, the resultant performance of this section of the boiler unit is influenced by two variable factors. These are (1) temperature of resultant gases of combustion, (2) velocity of resultant gases of combustion.

A high temperature gradient is necessary for efficient heat transfer, and temperature is therefore the predominating factor, since it influences all three methods of heat transmission—radiation, convection, and conduction.

Temperature is directly dependent upon furnace performance, and therefore the efficiency of the boiler unit is practically entirely influenced by the variable factors governing the operating temperature of the furnace.

Mechanical and physical properties of the materials used in the construction and setting of the modern mechanical stoker place, however, a limit to the temperature at which automatic stoker plant can be commercially operated, a compromise usually being arrived at between efficiency and maintenance.

The perfect combustion of a given fuel results in a definite maximum elevation of temperature above that of the original fuel and that of the combining weight of air supplied for combustion. This theoretically possible temperature is never attained in the furnace of an ordinary boiler unit, for the following reasons.

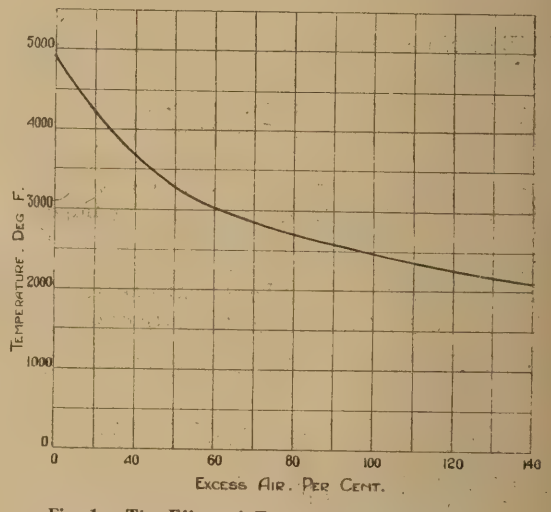

Fig. 1.—The Effect of Excess Air on Temperature.

In commercial practice it is impossible with the present types of equipment to effect complete and rapid combustion with the theoretical amount of air, and the necessity for the introduction of air quantities in excess of the theoretical, results in the dilution of the products of combustion and a consequent lowering of the temperature theoretically attainable.

In other words, the furnace temperature and the temperature of the resultant products of combustion are dependent upon the excess air quantity with which the process of combustion has been effected.

Under ordinary conditions of commercial operation necessitating the introduction of a certain excess air percentage, there will be in the gaseous products of combustion certain amounts of oxygen and nitrogen remaining uncombined. This excess oxygen and nitrogen must be heated from the initial temperature to a temperature equal to that of the gaseous products of combustion.

They thus rob the actual combustion products of a definite amount of heat, with the result that the actual mixture has a temperature lower than the theoretical. Considering in the meantime only this aspect of the question, it will be seen that furnace temperature and the temperature of the gases presented to the boiler are dependent upon the percentage of excess air utilised in the process of combustion.

The theoretical temperature attainable is also further reduced due to loss by radiation to bodies other than those of the useful heat-absorbing components of the boiler unit, and the decrease in temperature due to this

source is a function of the time taken for the complete combustion of a given mass of fuel.

Further, the restriction of the supply of air to values below that found necessary for commercial operation will produce temperatures below the theoretical, since, under these conditions, the heat generated will be less than that amount due to the carbon content burning to CO instead of CO_2.

Generally speaking, it can be stated that reducing the excess air will result in raising the furnace temperature, or in other words, if a furnace is operated at a point just below its critical point of combustion, which with modern equipment corresponds to 35 per cent. to 40 per cent. excess air (13 per cent. to 14 per cent. CO_2) it can be taken for granted that the furnace temperature and the temperature of the furnace gases are at their highest commercially attainable value. The curve in fig. 1 has been plotted from computations made for a theoretical case, and while not strictly accurate, since the effect of radiation is not included, it serves to show the approximate relation between attainable temperatures and air quantities involved in the combustion of a given coal.

To sum up what has been said, we can state that, assuming a mechanically perfect boiler unit and the complete oxidation of the combustible constituents of the fuel, the factor dominating boiler plant performance is the control of air flow in correct relation to fuel flow.

Before considering at length what relationship exists between rate of flow of air, heat generated, and useful heat absorbed, it should be pointed out that the boiler-room operating crew must fully understand the meaning of the indications given by the simple instruments used in boiler operation for the measurement of air pressure and air flow. The simple U-tube draught gauge, though not an actual air flow meter, is nevertheless an instrument of precision of equal importance to the steam flow meter and other elaborate boiler-room metering apparatus, and for the proper application of the information given by these instruments, a common-sense knowledge of the general principles of gas and air flow is necessary.

The meaning of the word "draught" is liable to be misinterpreted, in cases where a boiler unit is equipped with both "U"-tube and differential pressure gauges.

In boiler-room work, draught means an elevation or depression of pressure in relation to the pressure of the atmosphere, and does not in itself directly represent a definite relation to air flow, unless the value of such draught is considered along with fuel bed or gas pass resistance.

Differential pressure gauges are employed to indicate the drop in pressure between two points, as for example, the drop in pressure through the firebed, or the drop in pressure from the combustion chamber to the uptake.

It can be shown that if the air or gases flow through a path having a constant resistance, the pressure drop between two points in that path will be a measure of the rate of gas or air flow.

On a modern boiler unit with an efficient equipment of soot blowers, the gas passes of the unit can be considered as a path of constant resistance, and a differential pressure gauge connected to indicate the drop of pressure across this path will, therefore, be a gas flow meter, capable of giving measurements of acceptable accuracy for commercial operation.

For the control of furnace conditions, a combination of differential gauges and Pitot tube manometers can be profitably utilised.

The Pitot tubes are inserted in the forced-draught ducts carrying air to the grates, and the differential pressure gauges are connected to indicate the pressure drop through the fuel bed. Care must be taken when interpreting this pressure drop, for the instrument is not now measuring the pressure drop across a path of fixed resistance, and the indications given by the gauges will be affected by variations in the thickness of the fuel bed, due either to intentional operation or irregular combustion.

This combination of instruments for the measurement of furnace air conditions can be utilised to equal advantage even though the unit is equipped with more than one grate, necessitating two or more forced-draught ducts.

(To be continued.)

All-Electric House Developments.

Some Features of the Experiments at Woolwich and Ilford.

So much has been said on the subject of "all-electric" houses which is controversial and based on the estimates of various people interested in the subject, that any data taken from actual experiment or practice are particularly welcome. The recent developments in this direction at Woolwich and Ilford have enabled us to collect information which may prove of interest and value not only to electrical engineers, but to many connected with the building trades, and at the same time confirm the view already expressed that the all-electric house is a practical proposition.

Four such houses have been in occupation now at Woolwich for over 12 months. They have been erected on the Eltham housing estate of the Woolwich Borough Council, where there are at present over 600 six-room houses completed and occupied and others in the course of erection. It is interesting to note in passing that, although only the four houses referred to are "all-electric," all the other houses on the estate are equipped for electric lighting and cooking, the tenants being charged a flat rate of 2d. per kWh for all the electrical energy consumed.

As a safeguard the Borough Council included one chimney in the construction of each of the four experimental houses, but the bases of these have been built in, fig. 3, and coal fires have never been installed. The claim that in the "all-electric" house the saving on the cost of construction, due to the elimination of chimneys and chimney breasts, is sufficient to provide for the necessary electrical apparatus, has been substantiated in each building, although one chimney is included. The houses are semi-detached and contain six small rooms and a bathroom. Each electric installation includes nine lighting points, complete with pendants and holders; heating plugs in all bedrooms, living room and parlour; one 3-kW fire fitted with a hot receptacle for plates; one 600-watt bowl fire; one full-range cooker; one wash boiler and water-heating apparatus. The equipment in each house is similar, with the exception of the water-heating apparatus and wash boiler; these vary slightly, with a view to ascertaining the most suitable form of apparatus. The heating elements for the wash boilers are either clamped to the bottom of the boiler or fitted as immersion heaters, and are of 4-kW maximum capacity with 3-heat regulation. A hot-water tap supplies the boiler from the storage tanks.

In each of two of the houses two storage tanks are fitted, one serving the sink and wash boiler in the scullery and the other the bath and hand basin in the bathroom. In the other instances only one tank is provided in each house to serve both the scullery and the bathroom. The tanks are all fitted with low-wattage heaters, which must be connected to the supply either continuously or for 12 to 14 hours before hot water is required.

In one case the tank is provided with rather unusual heating arrangements. Two elements are included, one of 125-W loading for continuous service,

and the other, of 1,000 W, for boosting purposes. These are arranged externally to the tank in such a way that the small element heats the water in the top half and the boost provides for the lower half. This is brought about by creating a separate water circulation in each half of the tank; the element is housed in a cylinder with pipe connections to the top and bottom of the half of the tank in question, the water path being

Fig. 1.—Main Switch and Prepayment Meter.

Fig. 2.—Electric Geyser and Wash Boiler.

through the cylinder. The capacity of this tank, which serves the whole house, is 20 gallons. In one of the other houses are fixed two atmospheric tanks, each fitted with a ball cock for the cold water supply, one being placed in the scullery and the other on the first floor outside the bathroom. Each is equipped with an electric immersion heater. These tanks are different to the others in that practically the whole of the water is available for use at its inside temperature. This is due to the small inflow of cold water through the ball cock, which is purposely so adjusted. In another case the hot-water flow from the tank is regulated by the cold water tap so that the input and output are always the same.

Of the tenants occupying these houses two were nominated by the Electricity Committee and two by the Housing Committee of the Corporation. Three of these are non-technical people, and hence the consumption figures which have been obtained from the four houses may be taken as representing the normal use of electricity in the ordinary home. The ordinary flat-rate charges which are adopted by the Electricity Undertaking, per kWh, are—lighting 6d., heating and cooking 1d., and water heating 0.5d. Two systems of metering the consumption of the "all-electric" houses are being employed. In one the amounts of energy used on the various services are charged on the above-mentioned tariffs by a novel method which was originated by one of the staff, but only one meter is used. This is effected by introducing a current transformer with two tappings into the heating and cooking, and water-heating circuits with the secondaries connected to the series coil of the meter. The transformers are of 12 to 1 and 6 to 1 ratios for heating and cooking, and water heating, respectively. Thus the actual amounts which pass through the meter, charged at 6d. per kWh, are equivalent to the total amounts consumed and charged at the relative flat rates. This method results in the correct total charge being arrived at although the actual amounts of energy consumed are not given. The second system of charging is based on estimated proportionate relative consumptions on the different services for the ordinary household, by which a figure of 0.8d. per kWh for the whole supply is arrived at. The whole of the supply is controlled directly by one meter. Prepayment meters are installed in all the houses, and the following figures of consumption and revenue for the four houses (*a*, *b*, *c* and *d*) in question, covering a period of 13 months ending in December last, are of interest. (*a*) 7,327 kWh, £30 8s. 10d.; (*b*) 7,495 kWh, £31 4s. 3d.; (*c*) 5,509 kWh, £22 19s. 5d.; (*d*) 6,493 kWh, £27 1s. 3d. The above money amounts represent the revenue collected at the rate of 1d. per kWh, and were subject to a 20 per cent. rebate. This results in an average cost of £22 6s. 9d. for 13 months for lighting, heating, cooking and water heating—not, in most cases, an impossible or an uneconomical figure.

With the object of obtaining reliable and first-hand information regarding the practicability of the all-electric house, the Ilford Electricity Department has embarked upon an experimental scheme for which it is entirely responsible. Twelve all-electric houses have been provided, and these are owned by the Department, and are to be rented by its own employés. The houses are built somewhat on the lines of those of the usual Government housing schemes, with six small rooms, including a scullery and a bathroom. One coal fire is provided for in each house, although the necessary equipment for the electrical alternative is installed. A hot-

Fig. 3.—Sitting-room.

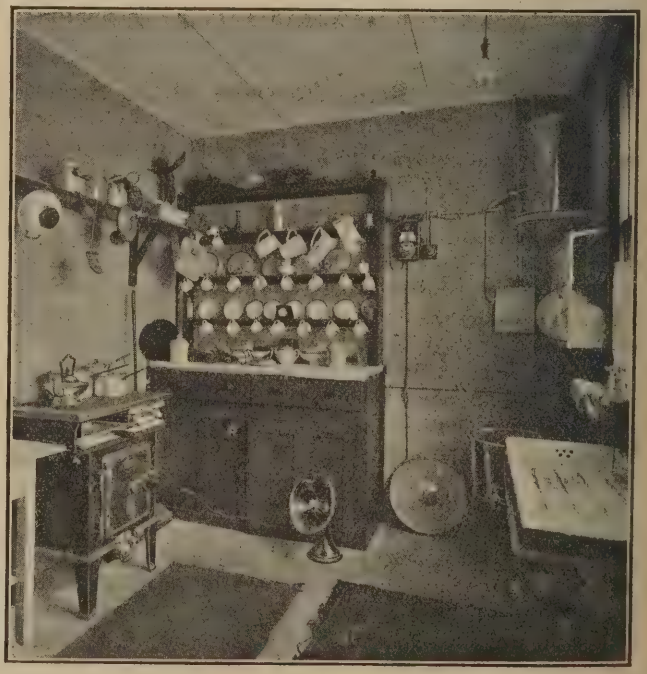

Fig. 4.—Kitchen.

All-Electric Houses at Woolwich.

water supply system is provided, and the water may be heated either electrically or by the coal fire. This is effected by the provision of two 1-kW immersion heaters in the circulation tank, with the result that the water may be heated wholly by either electricity or the coal fire, or the electric heaters may be used as a boost after the water has been brought to a certain temperature by the older method. This arrangement should prove a means of surmounting some of the objections to electric water heating met with in many places.

Each room is equipped with points for both lighting and heating, and two fires, one 2-kW bar-radiator and a small bowl fire, are provided in each house. In addition, the following apparatus completes the electrical equipment of each dwelling :—A full-range cooker (including an electric kettle), a wash boiler, and an iron. The whole of the hire and consumption charges for each consumer are covered by a fixed rate of 2s. per week, plus 0.75d. per kWh for the energy consumed. It may prove of interest to compare these figures with those of the ordinary all-in supply rates of the undertaking, *viz.*, 12.5 per cent. of the rateable value of the residence and 0.75d. per kWh. The houses have not yet been occupied for a sufficiently long time for any useful consumption data to be collected, but we look forward with interest to obtaining these at a later date. As in the case of the Woolwich houses a saving, amounting to the cost of the electrical apparatus, has been made on the construction of each house, the building cost of which amounted to £780. Special ventilation arrangements have been included in the houses, ventilating ducts connecting each room to a brick chamber and cowl mounted on the roof. For demonstration purposes one of the houses has been fully furnished, and is on view to the public for a period of three months which commenced on January 25th. It is interesting to note that during the first week of inspection about 750 persons visited the house.

The Issue of Material Supplies.

A Procedure to Minimise Delay.

By W. J. HISCOX.

Delays in production are often due to lack of material supplies, despite the fact that most sizes of material are stocked upon a maximum-minimum basis. Apart from this, there is the tendency of the modern planning department to insist upon sizes which hitherto have not been stocked, with the idea of reducing machining costs and thus increasing the capacity of the machining department.

With regard to sizes of material deemed to be in stock, failure of supplies is due chiefly to error occasioned by faulty stock records, for if orders are not booked until three or four days have elapsed since the issue of the material, it is obvious that in very many cases new supplies are not requisitioned until existing stocks are practically exhausted, and the buyer is unable to get in the new supplies before this happens. The only way to eliminate this trouble is to insist upon all issues being posted to the record cards daily.

MATERIAL REQUISITION

JOB No. ..... DATE ..... PART No. .....

Amount	PARTICULARS	C.	Qrs.	lbs.	Rate	£	s.	d.
	Issued by Recd. by							

Fig. 1.—Requisition Form.

Another factor is that in many cases the ordering point is fixed too low. It was probably fixed when the volume of work was much less than it is to-day, and no allowance has been made to meet the demands of increasing business. It is the case sometimes that the ordering figure is much less than the amount of material required for one single issue, and it is necessary, therefore, that in progressive works, the ordering figure should be revised from time to time.

Delay occasioned by the planning department insisting upon a size of material not hitherto stocked being used can be minimised by advance instructions being sent to the store, so that requisitions for supplies can be sent to the buyer before the material is actually required. For the most part, the store receives information only when the requisition is received, which means that the material is wanted at once. As the size specified is not stocked, the nearest size (larger) in stock is issued, but is returned from the machining department because the planner insists upon the correct material being used. More valuable time is wasted here, apart from the probable wastage of material, and the suggestion of advance instructions being sent to the store should be seriously considered.

Even if these safeguards are adopted, however, it does not mean that delay will be altogether obviated in connection with the issue of material supplies, although it should be considerably curtailed. Often the delay is extended because there is no intelligent procedure operating in the material store to ensure orders being promptly met when the material is received, whilst, in addition, the absence of such a procedure means that the buyer does not get information relating to the urgency of one specific class of material. The material storekeeper should at all times know exactly what orders are held up pending receipt of further supplies, so that he can give proper information to the buyer, and issue the material immediately it is received. The following procedure, put into operation by one firm of engineers, gave satisfactory results in this respect :—

All material demands were made known by means of a requisition form (fig. 1), made out in triplicate, two copies being sent to the store, and one retained by the foreman. In the event of the material being in stock, it was at once issued, one copy of the requisition being returned to the foreman (with the material) and the other (after signature for receipt was appended) retained in the store for posting to the stock card.

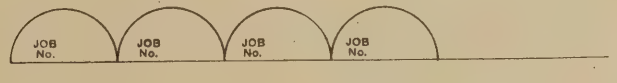

Fig. 2.—Guide Card.

If the material was not in stock, one copy of the requisition was at once returned to the foreman, endorsed "No Stock," while the other, similarly endorsed, was retained in the store, being placed behind a guide card (fig. 2) bearing the appropriate job number. Before this was done, however, a small card was made out and pinned to a board headed "Jobs awaiting material" (fig. 3), blue cards representing castings and stampings, and white cards bar and sheet materials, &c. In connection with the cards for castings and stampings, the part number or pattern number had to be given, while the cards for other materials had to give the size and

particulars of material, in addition to the part number for which the material was required.

The storekeeper ascertained from his stock card that sufficient supplies were on order to meet the demand, and twice weekly he sent to the buyer a list of all orders awaiting supplies, together with particulars of the material required. This had the effect of keeping the buyer posted with the urgency of any specific material, and influenced his actions in the matter of obtaining supplies.

It was not intended, however, that the storekeeper should confine his attention strictly to orders actually held up, for with the best intentions he could do no more than minimise delay that had already occurred.

JOBS AWAITING MATERIAL

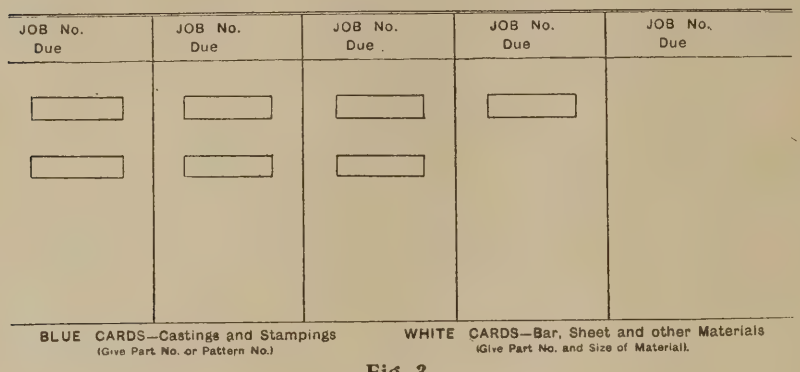

Fig. 3.

It was his business to maintain adequate supplies of material, and thus obviate delay, and he was assisted in this direction by the material shortage board (fig. 4). This board was arranged for classified materials, and under the various classifications appeared the materials, the stocks of which had reached the danger point, this information being derived from the stock card.

For example, the stock card for a specific material might give the maximum as 1,500 lb.; the ordering point as 750 lb.; and the danger point as 350 lb. Immediately the latter figure was reached, particulars were entered upon a small card, which was then pinned to the board under the correct classification, even though no jobs were held up for the material. A list of materials appearing upon this board was also sent to the buyer twice weekly, and many delays were obviated by prompt action on the part of the buyer, following information received from the material store.

It is undoubtedly true that in many works sufficient attention is not given to the material store by the management, and yet it should be apparent to all that any delay here is reflected throughout the whole course of manufacture. It may be contended that sufficient has been done by fixing the stocks to be held, and that it is the duty of the storekeeper to maintain a sufficiency of such stocks. In the modern works, however, the different phases of organisation are interdependent, and no one department can work quite independently. The storekeeper is influenced by circumstances quite outside his control, and the least that can be done is to give him the facilities which will enable him to make known to interested parties adverse circumstances, and also do his own work in the most expeditious manner possible. The method outlined in this article achieves these results.

Standardisation in Czecho-Slovakia.—The Czecho-Slovakian Government has recently adopted a number of standards for electrical work based on those in force in Great Britain, Germany, America, and France.

Legal.

Beet-Sugar Company Prosecuted.

The Nottingham magistrates, on January 30th, gave their decision in the case reported in our last issue (p. 211) in which the Anglo-Scottish Beet Sugar Corporation, Ltd., was prosecuted for failing to efficiently protect a brass collar conductor forming part of a screw-cap lamp, in consequence of which an employé was killed. During the original hearing the company claimed that the premises in question were not a "factory" within the meaning of the Act.

According to the *Nottingham Evening Post* the magistrates' decision was to the following effect:—"We are of opinion that the defendant company is guilty of the offence charged, and upon the summons in respect of neglecting to observe regulation 2, in consequence of which the workman John Albert Glover was killed, the company is fined £50."

Mr. Saywell asked that costs of 25 guineas should be allowed, but the magistrates allowed five guineas to come out of the fine.

A Dublin Electrical Dispute.

In the Dublin Circuit Court, before Judge Pigot, last week, Mr. P. J. Lawlor, electrical contractor, of Dublin, sued the New Ireland Assurance Society, Dublin, for £30, for work done in connection with the electrical installation at the Society's new premises.

Mr. Lawlor gave evidence as to his securing of the contract. When he had the work completed £35 was deducted under a clause in the specification, which stated "providing a sum of £5 for points in the schedule marked F." He contended that the proper construction of this clause was that £5 only should be deducted for all seven points. For the Assurance Society it was contended that the clause meant that £5 should be deducted for each of the seven points.

Judge Pigot held with the plaintiff, and gave him a decree for the £30 claimed.

Mullard Radio Valve Co., Ltd., and Ballantyne v. Hay and Son.

This action was mentioned before Mr. Justice Russell, in the Chancery Division, on February 5th, when Counsel for plaintiffs moved for an injunction to restrain infringement of two letters patent with respect to valves. Counsel stated that the defendants, who appeared in person, had consented to treat the motion as the trial of the action and to pay an agreed sum for costs. There would be no inquiry as to damages, defendants having disclosed the names of their suppliers. They were willing to submit to a perpetual injunction.

His Lordship made an order accordingly.

MATERIAL SHORTAGE

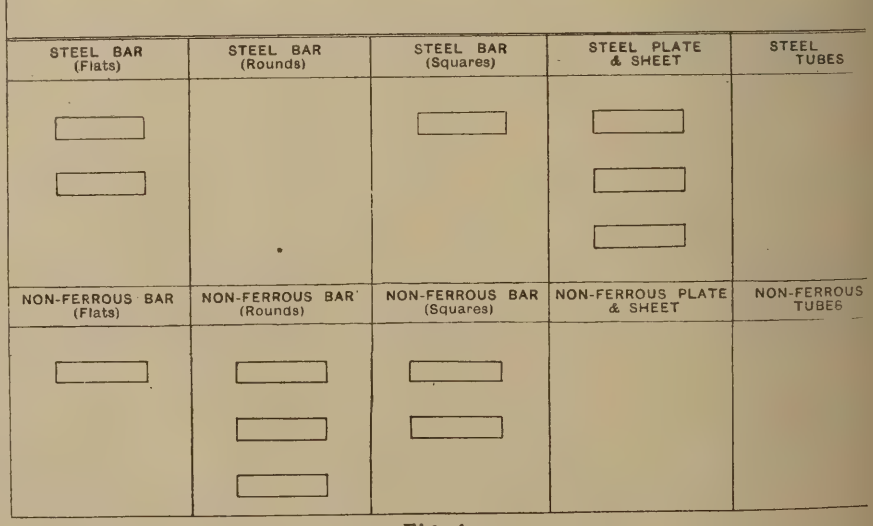

Fig. 4.

British Thomson-Houston Co., Ltd., v. London Electric Lamp Co.

In the Chancery Division, before Mr. Justice Russell, on February 5th, Counsel appearing for plaintiffs in this action moved for an injunction to restrain infringement of two letters patent. He stated that there was an *ex parte* injunction running over that day. Defendants were now willing to treat the motion as the trial of the action and to submit to an injunction. They would pay the costs, but there would be no inquiry as to damages, defendants having disclosed their suppliers. The plaintiffs waived any claim for damages.

His Lordship made an order accordingly.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Illumination at Blackpool Jubilee Celebrations.—At a recent meeting of Blackpool Jubilee Celebrations Committee, it was reported that Mr. C. Furness, electrical engineer, had considered the question of illuminations, and was of the opinion that it would involve a minimum cost of £8,500. It was proposed to have the greater part of the promenade illuminated, which would require nearly 200,000 lamps. The engineer suggested that the Committee should offer £250 to be distributed in prizes for the best illuminated features carried out by companies or ratepayers. It was proposed to charge 2d. per kWh for electricity for private schemes of illumination.

An Industrial Lighting Chart.—The dimensions of the chart issued by the BENJAMIN ELECTRIC, LTD., were given incorrectly in our last issue. It is 30 in. long and 20 in. wide.

An Inquiry from India.—An Indian firm (Bombay) desires to be put in touch with high class manufacturers of electrical apparatus of the types described below. Concerns already fully represented in India should not apply :—

(1) Switch and fuse gear, comprising fuses 15 to 200 amps., with back connections and terminals; cartridge fuses and aerial fuses. Knife switches 25 to 200 amps., unmounted, but complete with terminals. Ironclad switch and fuse boxes (D.P. and T.P.), 10 to 200 amps.

(2) Insulating materials, comprising ebonite and fibre sheets and rods, cotton tape and Empire tape and cloth.

(3) Poles for overhead transmission purposes.

(4) General electrical machinery.

All communications relating to these items should be addressed in the first instance to the ELECTRICAL REVIEW Service Department, 4, Ludgate Hill, London, E.C.4.

Our Productive Capacity.—In the course of his recent speech to the shareholders of the Midland Bank, Ltd., the chairman, Mr. R. McKenna, traced the causes of Great Britain's industrial depression. He said that this was generally attributed to one or more of the following causes: first, that much of our plant in the heavy industries was out of date and our organisation defective; secondly, that there was a superabundance in the world's supply of those commodities which we usually exported; thirdly, that wage costs were too high, more particularly in some of the sheltered industries; next, that the burden of taxation, both national and local, threw a charge upon industry which handicapped us in competition for foreign markets; and finally, that the unsettlement of Europe had gravely restricted the purchasing power of many of our customers. While these were all serious obstructions to trade, the policy of deflation had also contributed largely, but there was good reason to believe that eventually we should reap the reward due to this policy. Mr. McKenna said :—" It is not unusual for writers on the present day conditions of England to discover signs that the productive capacity of our country in competition with other nations has passed its zenith. I confess, however, that I do not share their opinion. There is always room for improvement, and I believe the years of depression have been a testing time for us and a warning to put our house in order. The exceptional depression has been largely due to temporary financial conditions, and I have strong hopes that these are now coming to an end."

A Co-operative Society's Electrical Department.—The Blackpool Co-operative Society recently opened a department for the sale and installation of electrical appliances and reports successful trading for the first half-year. The sales, direct and through other departments, amounted to £1,242 and work valued at £588 was done for members. The result was a net profit of £103.

Unemployment.—There was a decrease of 15,075 in the number of unemployed registered at the Employment Exchanges during the week ended January 25th. The total at that date was 1,200,800, as compared with about 1,241,000 twelve months earlier.

German Failures.—Official figures just published concerning the number of bankruptcies and applications for " Official supervision " (equivalent to moratorium) show that January eclipsed all previous records. There were 2,092 bankruptcies and 1,553 supervisions granted, as against 660 bankruptcies and 1,388 supervisions in December. Bankruptcies were therefore three times those of the worst previous month. Though these bankruptcies were distributed throughout all industries textile and motor branches suffered more than any other.—*Financial Times.*

Capturing Foreign Markets.—In a speech at Woking last week Mr. A. M. Samuel, Parliamentary Secretary of the Department of Overseas Trade, said that British manufacturers should endeavour to produce more decorative and up-to-date goods for foreign markets. According to the *Financial News* Mr. Samuel made special reference to telephone and radio apparatus. " We accepted," he said, " the vulcanite telephone receiver, but no one ever attempted to enclose it in a box or case to keep the instrument clean." Our equipment was second to none for wireless sets and in a few years' time every house, if not every room in a house, would possess a set.

Electric Meters for Japan.—The demand for electric meters in Japan has in recent years reached large proportions; in 1924 no fewer than 400,000 were bought. The bulk of these were of German manufacture, although appreciable quantities were supplied by the United States, Great Britain and Switzerland. Japanese manufacturers find it impossible to compete with foreigners on the score of low prices, and they propose to ask the Government to raise the import duty upon these meters.

Callender's Hospital Fund.—We have received a copy of the 23rd annual report of the Hospital and Distress Fund of Callender's Cable and Construction Co., Ltd. The receipts during 1925 amounted to £1,550 (including £95 brought forward) and the expenditure to £1,468, leaving a balance of £82 in hand. Apart from rendering aid to over 360 members, the fund made grants aggregating £934 to sixteen institutions.

The Basle Water-Power Exhibition.—It is announced that a number of the leading European countries are officially participating in the International Exhibition of Inland Navigation and the Utilisation of Hydraulic Power which is to be held at Basle from July 1st to September 12th this year. Negotiations are also proceeding with the Governments of Great Britain, Canada and other countries.

The Reorganisation of the Supply Industry.—Mr. Samuel Ferguson, managing director of Messrs. Ferguson, Pailin, Ltd., said at the company's recent annual meeting that the reorganisation of the electricity supply industry would take 15 years to complete. The London area was in such a deplorable state electrically that even if the whole of the industry's efforts were applied to its reorganisation, the task would take five years.

World Employment.—The issue of *British Industries*, dated January 30th, contains a series of curves showing the trend of employment in the eight leading industrial countries during 1923, 1924, and 1925. The United States curve shows a large decline of employment in 1924 with a partial recovery in the succeeding year. The French and Belgian curves are practically level. The trend in Italy has been upward but there have been two or three sharp lapses. The Canadian curve, while horizontal in character, has also experienced some fairly large fluctuations. There was a very serious fall of employment in Germany at the end of 1923, but since that the general tendency has been improvement and 1925 closed with employment at about the same level as at the beginning of 1923. The United Kingdom curve is flat but with a decided improvement in 1924, and a return to the 1923 level last year. Swedish employment has encountered violent fluctuations; the curve appears to be of a seasonal character—high in summer and low in winter.

Australian Customs Tariffs.—Owing to the Australian manufacturers not being in a position to meet the requirements of Australian users, the Department of Trade and Customs has deferred until April 1st the operation of duties which were to have come into operation on January 1st, 1926, upon valves for radio-telegraphy and telephony.—*Reuter's Trade Service* (Melbourne).

International Customs Tariffs.—Writing in the " Review of 1925 " issue of the *Manchester Guardian Commercial*, Prof. Gilbert Cannan says :—" It is quite impossible to believe that the present barriers against the free movement of persons and goods will be long maintained by the two dozen States between which Western Europe is now divided. A perception of common interest must soon lead to Customs unions being concluded here and there, and when the movement is once begun it will be difficult to stop, as the largest combination will offer great attractions to other units. . . Hence we should not dismiss as altogether Utopian the talk of a European, or at all events a Western European, Continental Customs Union or Zollverein, which was heard of last year in the most unlikely quarters. Sooner or later, unless the whole system of Customs duties is first abandoned, such a consummation will come about. Great Britain will then have the choice of joining the Continent or becoming a perfectly free port. It is scarcely conceivable that she could stand aside with a protection system of her own."

A Siemens-G.E.C. Combination.—It is announced that arrangements have been made to merge the railway signalling departments of Messrs. Siemens Bros. & Co., Ltd., and the General Electric Co., Ltd., under the title of " Siemens and General Electric Railway Signal Co., Ltd."

Trade Announcements.—MR. F. J. GORDON, manufacturers' representative, has moved to larger premises at 92, Charlotte Street, W.1, including a showroom and stores.

MESSRS. W. WORBY BEAUMONT & L. W. BURT have removed their offices to 20, Essex Street, Strand, W.C.2. Their telephone number and telegraphic address are unaltered.

MR. H. H. CASSE has resigned his directorship of Charles Bell, Ltd., and has commenced business in partnership with Mr. N. Walker at St. Jude's Place, Manningham Lane, Bradford.

MESSRS. JAMES GORDON & CO., LTD., inform us that Mr. J. J. Lassen has retired from the board of directors, and has no further interest in or connection with the company.

Mr. John Harris, of 113-117, Caversham Road, Reading, has opened an electrical service station in connection with his business.

Messrs. T. W. Broadbent, Ltd., of Victoria Electrical Works, Huddersfield, have arranged with Messrs. Darroch and Espie, of Dock Works, 37, Weir Street, Paisley Road, Glasgow, to act as their representatives in Scotland for the sale of a.c. and d.c. generators and motors, as successors to Mr. James Espie of the same address, who is retiring from business.

Miss E. Stringer informs us that she has resigned her position as London manager for the Concordia Electric Wire Co., Ltd., having been appointed sole selling agent for F. & E. Stanton, Ltd. She is opening a sales office at 3, Victoria Street, S.W.1. (Telephone: Victoria 1485.)

The Saxonia Electrical Wire Co., Ltd., has taken over the stocks of insulated copper and resistance wires of the Engineering Supplies, Ltd., and is supplying these instrument wires in addition to the flexible cords, &c., which they manufacture.

Catalogues and Lists.—Siemens and English Electric Lamp Co., Ltd., 38 & 39, Upper Thames Street, E.C.4.—February price sheet of electrical materials and appliances. Fully illustrated.

Higgs Motors, Witton, Birmingham.—A price list of industrial electric motors (a.c. and d.c.), d.c. generators, and motor-generator sets.

The East London Rubber Co., 29, Great Eastern Street, E.C.2.—A set of illustrated and priced sheets adding to and revising the firm's comprehensive radio apparatus catalogue.

Messrs. Young & Wildsmith, 20, Bloomsbury Street, W.C.1.—A trade price list of electrical materials and accessories.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Catalogue Section SF, illustrating and describing various types of signs and flashers produced by the company, fully priced; and a mailing card advertising "Pirelli-General" flexible cords with cotton and silk coverings of various colours.

Messrs. L. McMichael, Ltd., Wexham Road, Slough, Bucks.—Pamphlets dealing with h.f. radio transformers and their use, "Dimic" air-spaced coils, condensers, grid leaks, &c. Illustrated and priced.

Crane Packing, Ltd., Slough, Bucks.—A brochure dealing with the use of metallic packing in various spheres; also two illustrated pamphlets treating of the same subject.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—A leaflet advertising the company's electric lamp service.

K.F.M. Engineering Co., Ltd., 29-31, Portugal Street, Kingsway, W.C.2.—A well-illustrated catalogue of "Internalite" day and night signs.

Messrs. Ferranti, Ltd., Hollinwood, Lancashire.—Illustrated pamphlets dealing with the company's l.f. transformers, including amplification curves over the musical scale. Also a showcard advertising this component.

Messrs. George Green & Co., 40, Aybrook Street, W.1.—Leaflet No. M.214, bearing an illustration and prices of "Gee-Gee" electric tea urns.

Bankruptcy Proceedings.—H. L. Wood, 7, Taswell Road, Southsea, Hants, electrical engineer and radio dealer.—The public examination of this debtor was held on February 1st, at the Court House, Portsmouth. The statement of affairs showed liabilities of £4,069, against assets of £85, leaving a deficiency of £3,984. Debtor attributed his failure to judgment and costs of an action brought against him by his late partner amounting to £1,917. He commenced business as an electrical engineer in 1918, at High Street, Clapham, with about £500 capital. The business appeared to have been a success, and in August, 1920, was sold for £1,500. He came to Portsmouth and started a new business, and in March, 1921, he was joined in partnership by another, who paid £2,000 for a half share in the business. The partnership bought an additional business and traded as electrical engineers, later dealing in radio sets. The business was not successful, and in May, 1923, a deed of dissolution was executed and the business wound up. As a result a claim was made against the debtor. He then entered into partnership with his wife, and on November 17th last the business was converted into a company and he and his wife were directors. The consideration for the sale was £1,998, which was satisfied by the allotment and issue to the vendors of 498 ordinary shares and by the issue of £1,500 debenture stock to debtor's wife. The examination was adjourned.

G. W. H. Hanford (Radio Manufacturing Co. and the O.I.C. Manufacturing Co.), 37, Gold Street, Southsea.—Trustee, Mr. C. Hoult, 87, High Street, Portsmouth, released January 27th.

W. G. Bayman, electrical engineer, late of 13, Russell Street, Plymouth, now of 86, North Side, Wandsworth Common, S.W.—Last day for proofs for dividend February 17th. Trustee, Mr. T. Gourlay, 29, Russell Square, W.C. Discharge suspended for one year, until January 11th, 1927.

P. Boswell (Boswell & Co.), electrical engineer, 132, Earl's Court Road, S.W., and 110, Ebury Street, S.W.—Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C., released August 26th.

R. E. Hughes and R. McL. Alexander (R. E. Hughes and Hughes and Alexander), house furnishers and electrical and wireless engineers, 129, Brockley Rise, S.E., and 51, Honor Oak Park, S.E.—Trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., released October 1st.

M. Kelly, radio apparatus dealer, 12, Jackson's Row, Manchester.—Receiving order made February 3rd, on creditor's petition.

Company Liquidations.—Antill, Ltd., Seymour Place, Marble Arch, W., electrical engineers, &c.—A meeting of creditors was held on February 6th, at the Institute of Chartered Accountants, E.C. Mr. C. Pittman, C.A., the liquidator of the company, submitted a statement which disclosed liabilities of £7,593 and net assets of £1,258, leaving a deficiency as regarded the unsecured creditors of £6 335. It was reported that Mr. R. A. C. Antill commenced trading in 1914. He joined the Army during the war, disposing of his business. On his demobilisation in 1919 he again started trading, and the present company was formed and took over the concern, in 1920. The issued capital of the company was £8,625. Between May and December, 1920, there was a net loss on the trading of £442, and in 1921 there was a net loss of £1,643. In the succeeding 12 months there was a net loss of £975, and in 1923 the net loss rose to £1,973. During 1924 a net profit of £490 was earned, but since that time further losses had been sustained aggregating £3,437. The company's turnover ranged from £20,000 to £33,000 per annum, and it was stated that losses had been incurred on contracts. Some little time ago creditors were approached and asked to stay their hands, it being hoped that arrangements could be made for the payment of all the liabilities in full. Creditors, however, began to press, and liquidation then took place. A resolution was passed confirming the voluntary liquidation of the company, with Mr. Pittman and Mr. A. E. Quaife, of Messrs. Westacott, Quaife & Co., of High Holborn, as joint liquidators.

Pressland Electric Supplies, Ltd.—Winding up voluntarily. Liquidator, Mr. W. Bronson, 157, Cricklade Avenue, Streatham Hill, S.W.2. A meeting of creditors is called for February 17th at the Sun Hotel, Kingston-on-Thames.

Dissolutions of Partnership.—May & Jennings, gas, oil, electrical and mechanical engineers, 203, Kirkstall Road, Leeds.—Mr. A. C. May and Mr. W. A. Jennings have dissolved partnership. Mr. May will attend to debts.

Ernest Weston & Co., motor and wireless engineers, &c., London Road, Crowborough.—Messrs. E. Weston and L. J. Dumble have dissolved partnership.

Meeting of Creditors.—Cole, Marchent & Morley, Ltd.—An informal meeting of creditors will be held at Prospect Works, Wakefield Road, Bradford, on February 16th, when a statement of affairs prepared by the company's accountants will be presented to the meeting.

The Portuguese Electrical Market.—In a recent article upon this subject, *Commerce Reports* says that the relative cheapness of domestic labour and the high price of electrical energy in Portugal, discourage the sale and use of domestic electrical appliances. Germany satisfies the greater part of the limited demand for electric fans, offering them at low prices and giving liberal credit. The same applies to vacuum cleaners. The above-mentioned high charges for electricity preclude electric cooking, although there is a demand among the wealthier classes for small water heaters, toasters, hotplates and percolators. Both cookers and heaters would probably become popular if the charges were reduced. Electric washing machines are practically unknown. Refrigerators are used to some extent, the large hotels employing German makes. A firm securing the general agency of a manufacturer always desires the whole of Portugal as its territory and this is usually satisfactory when the concern has connections in Lisbon. Electrical appliances are sold on a strictly cash basis, but it is considered that there is scope for the introduction of a rental system by private interests.

Railway Electrification in Venezuela.—Mr. J. A. Goudge, C.B.E., chairman of the La Guaira and Caracas Railway, speaking at the company's recent annual meeting, is reported by the *Financial Times* to have said:—"We have seen the results of several schemes of electrification of railways in South America and elsewhere, which, frankly, have not increased the profit of the undertakings which have constructed the electrification. But if you ask us to-day whether we would face the responsibility of going on as we are or spending the money which we propose to spend in electrification, we unhesitatingly say we will electrify."

The Traders' Co-ordinating Committee.—This committee, which was formed five years ago by the Federation of British Industries, the Association of British Chambers of Commerce, and other organisations, to co-operate in the presentation of the traders' case before the Railway Rates Tribunal, is appealing for funds to enable it to continue the work which it has been carrying out successfully. It is claimed that the Committee has already saved the traders of the country £3,000,000 a year which would otherwise have gone to the railway companies, and an unratified agreement has been made whereby a saving of a further £3,000,000 will be effected. The offices of the Committee are at 39, St. James's Street, S.W.1.

New Australian Companies.—Williams & Shaw Pty., Ltd., is the name of a company recently formed in Melbourne with a capital of £20,000 to carry on business as electrical engineers, indentors and importers.

With a capital of £20,000, the Victor Storage Batteries Pty., Ltd., has been formed in Melbourne to engage in the manufacture of electric storage batteries, &c.

The 44-hour Week in Australia.—The Forty-Four Hour Act came into force in New South Wales on January 4th. It provides that while no more than 44 hours shall be worked in any week the hourly rates shall be increased to bring wages to the same figure as prevailed under the 48-hour week arrangement.

South American Markets.—Two recent Department of Overseas Trade publications (obtainable from the Stationery Office) deal with markets in the South American region. The first is a report on Ecuador (1s. net) by the Acting Chargé d'Affaires at Quito, Mr. W. C. Graham. It is stated that a peaceful *coup d'état* occurred in July, 1925, and a provisional government was formed. The latter's programme includes the unification of the complicated Customs duties and the revision of all municipal and public contracts. There is said to be a growing market for industrial and agricultural machinery; German and American manufacturers have established machinery stocks, which place them in a favourable position. The imports of machinery and apparatus during 1924 showed a decrease in weight from 3,277,566 kg. to 3,251,252 kg., but the value rose from £186,654 to £236,823. British traders are advised to draw up all their catalogues in Spanish and to be very careful in their choice of representatives in this market. Cases are not uncommon of British manufacturers appointing agents who also represent foreign houses dealing in a similar line of business. Appointments should not confer representation for the whole of the west coast of South America—a region far too wide for one agent to cover.

The second report deals with the Dominican Republic and Hayti (1s. 6d. net). The part relating to the former State, by Mr. J. Bowering, British Consul and Chargé d'Affaires at Santo Domingo City, states that the imports of electrical machinery, apparatus, and appliances during 1924 were valued at $118,270, the United States' share being 96.5 per cent. In 1923 the value was $117,072. The report says that the demand is principally for low-grade or second-quality goods as the purchasing power of the population is limited. Quotations should be c.i.f. Dominican ports and in American dollars. Mr. E. D. Watt, Acting Consul at Port-au-Prince, says that although Hayti is supposed to be rich in mineral resources no attempt has been made to develop them, which leads to the belief that either the quality or the quantity does not justify development. The British share of the import trade increased during the year 1924-25 and, given competitive prices, there is no reason why it should not continue to expand. The imports of machinery and apparatus during the period October 1st, 1924, to August 31st, 1925, were valued at $480,332.

British Railway Material for New Zealand.—The Premier of New Zealand announced last week that the Government would shortly invite tenders for the supply of railway material valued at £300,000 as the first instalment of the £800,000 extension scheme which is to be carried out during the next three years. It is to be stipulated that only material produced in the British Empire shall be used.

New Municipal Showrooms.—The Mayor of Lincoln (Miss M. E. Nevile) formally declared open the new showrooms of the Lincoln Electricity Department, in Corporation Street, on February 1st. A large number of officials were present, including the city electrical engineer (Mr. Stanley Clegg), the chairman of the electricity committee (Ald. W. S. White), the electrical engineer of Grimsby (Lt.-Col. Vignoles), and the vice-chairman of the Grimsby Electricity Committee (Councillor C. Fletcher). Ald. W. S. White, in the course of a speech, said that it was now realised that it paid to advertise just as much when selling electricity as any other commodity. The Lincoln Corporation electricity undertaking was inaugurated in November, 1898. In 1899 an exhibition was held, but though no doubt this gave a start to the department, the progress made for some years was very slow. Two years ago a second exhibition was held, and it could be truly said that the business of the department had expanded since that date in a manner never previously known. The appeal of that exhibition was made particularly to the householders in the city, and it was in the use of electricity in the home that great strides had been made.

Malay Hydro-Electric Scheme.—In a recent interview with the *Financial News*, Sir Montague Barlow gave some particulars of the Perak River hydro-electric scheme for which Sir W. G. Armstrong, Whitworth & Co., Ltd., have received a concession from the F.M.S. Government. It is proposed to form a public company to operate the concession. A dam and two sluices will be constructed in the river to give a gross head of 59 ft. There will be two 9,000-kW generators with provision for a third, and a steam stand-by plant with a capacity of 5,000 kW will also be provided. The bulk of the power will be supplied to the tin mines in the Kinta Valley and a number of electrically-operated dredges are being made to utilise it. The agreement (which is backed by the Government under the Trade Facilities Acts) requires that all machinery, &c., shall be of British manufacture, and the company will place orders for well over a million pounds' worth of work with British firms.

Social Event.—The annual dinner and general meeting of the A.T.M. Golf Club (Automatic Telephone Mfg. Co., Ltd.), were held at the Bear's Paw Restaurant, Liverpool, on January 30th. After dinner Mr. G. W. Moore (manager) presented trophies and medals to the successful members, Mr. C. H. Archer securing the "Tay-Mel" cup (presented by Messrs. E. Taylor and E. A. Mellinger, directors of the company). Mr. J. J. Langley was elected captain for the forthcoming season, Mr. W. A. Philips secretary, and Mr. G. C. Hague treasurer.

German Loans in America.—The *Financial Times* states that a group of towns in the Palatinate have taken up a loan of $3,800,000 at 7 per cent. against joint security from a consortium of American banks. The loan is for 20 years and will be used for the development of the municipal gas, water, and electricity works. The Berlin municipality is also seeking a short-term loan of $3,000,000, at 6½ per cent. from one of the leading New York banks. This is required to finance the completion of the big power station at Rummelsburg.

Municipal Trading at Burnley.—The Burnley Corporation has discussed with the British Electrical and Allied Manufacturers' Association the question of the terms upon which the electricity department proposes to sell domestic and other apparatus to the public, as well as the terms of hire purchase. As a result of the conversation, all existing resolutions concerning the sale or hire of electrical appliances are to be rescinded and fresh regulations drafted. Cash sales are to be at the list prices issued by the manufacturers. Thus, a difficult question affecting the interests of local electrical contractors has been amicably arranged.

The electrical exhibition organised by Burnley Corporation was brought to a close on February 6th. It has been extraordinarily well supported, and is described as one of the most successful events in the Provinces. Domestic apparatus has been freely sold, and the Department have had some difficulty in coping with the rush. The Corporation is making a feature of wiring people's houses on the deferred payment system, a four-roomed dwelling being done for £12, of which sum 36s. is the immediate deposit, leaving the balance to be paid at 12s. 9d. per quarter.

Irish Free State Electrical Imports.—The appended table shows the value of the total imports of electrical machinery and apparatus into the Irish Free State during the first nine months of the two past years, and the amount attributed to the United Kingdom as country of shipment but not necessarily of manufacture :—

	Total. Jan. to Sept.		U.K. share. Jan. to Sept.	
	1925. £	1924. £	1925. £	1924. £
Electric wires and cables	81,737	52,032	68,757	39,618
Telegraph and telephone instruments and apparatus	21,279	24,018	21,074	23,893
Electric lamps and parts	38,440	36,237	37,931	34,333
Batteries and accumulators	22,063	17,111	20,666	16,254
Radio sets and parts ...	34,964	78,615	34,023	76,997
Other electrical goods and apparatus	50,549	78,830	48,117	75,496
Electric generators ...	10,660	6,864	10,147	6 726
Electric motors	18,853	12,760	18,316	12,175
Other electrical machinery	51,887	31,838	45,719	31,020
Totals	£330,432	£338,305	£304,750	£316,512

It will be seen that while wide variations are shown in the different classes of goods, the 1925 imports show a drop of £7,873, as compared with those of the preceding year. All but £25,682 of the goods came from the United Kingdom, and of the balance £8,999 is attributed to Belgium, £7,867 to Germany, and £8,999 to "other countries."

The Swiss Electrical Engineering Industry.—A Swiss contemporary, commenting on the electrical engineering industry in Switzerland during the past year, states that while during the first six months an increased output was recorded, new orders were difficult to obtain during the second half of 1925 owing to the keenness of international competition. Moreover, as orders for new material for the Swiss Federal Railways have decreased, the outlook is not regarded as very bright. The recent fall in the value of the French franc is also regarded as detrimental to the Swiss electrical industry.

Strike at Padiham Station.—A strike has occurred among the steel constructional engineers of one of the contracting firms at the Lancashire Electric Power Co.'s station at Padiham. The men receive 1s. per hour for their labour, and are claiming 1s. 5½d. per hour, which, they allege, is the minimum for constructional work.

Swiss Industries Fair.—CORRECTION.—We regret that the date of this Fair, which is to be held at Basle, was given incorrectly in our issue of January 29th. It is to run from April 17th to 27th.

German Aid for Russia.—According to a statement published by a Berlin newspaper, the Soviet State Electrical Trust has entered into an agreement with the A.E.G. for a period of five years to secure technical assistance for the Russian works for improving the production. The trust is given the right to utilise the German company's patents, will be supplied with patterns, and will have the right of having engineers trained at all works of the German company.

"Electrical Freedom."—This is the title of a booklet which has been produced by the Electrical Contractors' Association (Inc.). It is described as a brief statement of the claims of electrical installation contractors and electrical retailers, and it is mainly directed against State and municipal electrical trading and contracting. It is contended that while electricity supply should be carried on under public control, as water supply generally is, municipalities should not engage in the wiring of premises and the sale of electrical appliances.

An Austrian Electrical Syndicate.—It is announced from Vienna that the four large manufacturing companies—the A.E.G.-Union, the Siemens-Schuckert Co., Brown, Boveri and Co., and the Elin—recently formed themselves into a syndicate for the purpose of fixing prices and conditions of delivery on a common and uniform basis, particularly in the case of contracts open to public competition. The constitution of the syndicate is now said to have evoked opposition in various quarters. Thus the city of Vienna states that in order to cope with the situation it will obtain its requirements from abroad in future, while a similar decision is credited to the Austrian Federal Railway authorities.

Threatened "Underground" Electricians' Strike.—We reported recently that members of the Electrical Trades Union employed in London electricity undertakings had been awarded an increase of 6¼ per cent. in their wages. The "Underground" railway companies have declined to apply this award to the men employed in their power stations, and in consequence the Union has decided to take a ballot upon the question of a strike among its members employed in railway power stations; the papers are returnable by February 20th. About 1,000 men are involved. The railway companies contend that they are not so favourably placed as the supply authorities in their ability to pay the increase. The Minister of Labour is said to be "watching" the situation.

Book Notices.—"Faraday House Journal." Vol. XI, No. 5; Lent Term, 1926.—Mr. L. J. Kettle, electrical engineer and manager of the Dublin, Irish Free State, electricity undertaking, is the subject of the frontispiece. He is president of the F.H. Old Students' Association. Mr. E. C. I. Macdonald deals with Brazilian railway electrification, Mr. S. Gibson writes on asbestos, and Mr. W. A. Benger describes the Parkinson "Tork" single-phase motor.

"Science Abstracts." A & B. Vol. XXIX, Part 1, No. 337, and Index 10, Vol. XXVIII (A & B). London: E. & F. N. Spon, Ltd. Price 3s. each.

"Pyrometers," by E. Griffiths. Pp. xi + 126; figs. 49. London: Sir Isaac Pitman & Sons, Ltd. Price 7s. 6d. net.

"The *Journal* of the South African Institution of Engineers." Vol. XXIV, No. 6. January, 1926. Price 2s.

"The *Electrician* Electrical Trades Directory and Handbook for 1926." London: Benn Bros., Ltd. Price 25s. net.

United States Electrical Exports. — According to *Commerce Reports*, the preliminary figures of exports of electrical goods from the United States during the first eleven months of last year show a total value of $80,264,527, which is only $1,800,000 below the total for the whole of 1924. It is estimated that the figure for the full year will be about $85,000,000. This is not a complete figure, however, for a great deal of electrical apparatus is incorporated in other exports, *e.g.*, automobiles, washing machines, refrigerators, &c. Generally speaking, more business was done in smaller equipment during 1925, and less in heavy equipment. This is attributed to some extent to the increasing representation of the smaller American firms in foreign markets. There were increases in a.c. generators, steam generating sets, and self-contained lighting sets, but the shipments of d.c. generators and motors were smaller. Small motors showed a substantial gain, but stationary and railway motors declined. There was a large fall in the exports of electric locomotives, but the shipments of batteries were heavy, owing to the interest in radio-telephony. The exports of telephone and telegraph apparatus remained at about the same level, but those of domestic appliances continued their rapid progress. Wiring devices, electric lamps, and ignition equipment exports all showed rises, but the greatest increase occurred in the radio apparatus section, which increased by about $4,000,000 to $8,936,565 in the first eleven months of 1925. It is estimated that radio exports constituted 11 or 12 per cent. of the whole of the United States foreign electrical trade during 1924.

As regards distribution, it is said that exports to Europe were slightly smaller, but Great Britain remained the principal customer. Exports to Australia and New Zealand and South America increased.

For Sale.—Birmingham Corporation Electric Supply Department has for disposal three d.c. and one a.c. generating sets. Messrs. Fuller, Horsey, Sons & Cassell will sell by auction on March 2nd and following days, at the Cubitt Engineering Works, Aylesbury, the entire contents of the works, including engineers' machine tools, motor-body building plant, electric power plant, &c. (See our advertisement pages to-day.)

An Arc-Welding Plant Contract.—Among the orders secured by members of the F.B.I. recently was one for three two-operator arc welding machines for the Eastern Bengal Railway, supplied by Alloy Welding Processes, Ltd.

The London Engineering Dispute.—Negotiations between the engineering employers and employés in the London district regarding the application for a 20s. per week increase remained suspended last week on account of an unofficial strike at a printing-press manufacturer's works. A meeting between the national executive of the Amalgamated Engineering Union and the London District Committee of the union was held on Saturday last to discuss the dispute.

Electric Locomotive Manufacture in Japan.—In August last an order was placed by the Nippon Denryoku K.K. for four 25-ton electric locomotives with the Kawasaki shipbuilding yards. Although the works had had no previous experience of the work, two of the locomotives were completed in four and a-half months. It is claimed that the materials used are wholly Japanese, there being no foreign work in them whatever. The yards are said to have orders for 12 more locomotives for various railway authorities.

An Anglo-Greek Electricity Scheme.—The Athens correspondent of the *Financial News* reports that under the contract signed in September last between the Greek Government and an Anglo-Hellenic group (including the Power and Traction Finance Co., Ltd.), the latter has received a 60-year concession. This gives the group the exclusive right of the production and distribution of electricity within a radius of 20 km. from the centre of Athens, and the exclusive right to install and operate tramways in this area; the right to supply electric current to bodies outside this area; and the exclusive right of the exploitation of the Athens-Kefissia Railway. The initial capital of the group will be about £4,000,000, half of which will be raised in London under the Trade Facilities Acts.

American Sales in England.—The sale of high-grade radio parts of American manufacture has increased considerably in England, and there is a growing desire among British electrical dealers to become agents for American radio manufacturers. This demand is also being felt in the household appliance line.—*Commerce Reports.*

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report February 9th:—Copper (electrolytic) bars, £67, 30s. increase; do. do. sheets, no change; do. do. wire rods, £77, 30s. increase; do. do. h.c. wire, 9¾d., ¼d. increase.

Messrs. James & Shakespeare report February 9th:—No change in the prices for copper bars (best selected), sheet and rod; English pig lead, £35 5s., 10s. decrease.

Messrs. Edward Till & Co. report February 9th:—India-rubber, Para fine, 2s. 8d., 1d. decrease.

Salvadoran Customs Decision.—The Government of Salvador has decided to admit electric signs of all types free of all import duties and other charges.

Strike at Yallourn.—Six hundred miners employed at the Victorian Electricity Commission's brown coal mine at Yallourn have gone on strike. The men allege that the Commission is delaying its decision with regard to wages and also that the living conditions in the mine township are "intolerable."—*Reuter.*

Lighting and Power Notes.

Argentina.—Buenos Aires.—According to *Power*, after an exhaustive engineering study, the Compania Hispano-Americana de Electricidad is obtaining two tandem-compound steam turbo-generators as the initial installation for the new generating station to be built at the entrance of the harbour of Buenos Aires. Each generator will be a 50,000-kW, 13,200-V, 1,500-r.p.m., machine with a 250-V, d.c. exciter, and a 2,500-kW, 2,300-V service generator with its own d.c. exciter, all mounted on the same shaft.

Barrow.—Hydro-Electric Scheme.—The proposed hydro-electric scheme, which has been under consideration for some time came before the Corporation on February 1st. It is proposed to harness the Backbarrow Falls on the River Leven, which is the outlet of Lake Windermere, and to erect a power station for the accommodation of three 500-kW turbo-alternators. The output is estimated at 4,000,000 kW per annum and the estimated cost is £78,000 for the construction of the station with headrace, pipeline, plant, &c., and £12,000 for transmission lines. A saving of from 4,000 to 5,000 tons of coal per annum is anticipated. The scheme has been held up on account of opposition to the terms of agreement with the Lancashire Ultramarine Co., and the Backbarrow Charcoal Iron Co., for the transfer of their water rights at Backbarrow. The Corporation has now approved the scheme and also the amended terms with the two companies for compensation.

Birkenhead.—Electricity Agreement.—The Electricity Committee has obtained a draft agreement for an increased supply of electricity in bulk from the Walsall Corporation.

Loan.—The Committee is applying for sanction to the borrowing of £21,319 for the erection of transformers, rotary converters, and the provision of connecting cables.

Blackburn.—Loan.—The Town Council, on February 4th, approved of an application for powers to borrow £5,000 for the provision of electric cooking apparatus to be let out on hire.

New Sub-Stations.—The Council has also approved plans for the erection of sub-stations in Cornelian Street and Cabin End Row.

Blackpool.—Loans.—The Corporation is applying for sanction to the following loans:—£22,200 for cables; £3,800 for transformer chambers and switchgear; and £9,000 for new phase and frequency changers in connection with the electricity undertaking.

Canada.—Hydro-Electric Development.—The fifth generating set of the Cameron Falls power station, Nipigon development, was put into commission on December 1st last. This set was urgently needed as the demand of the Thunder Bay system in November recorded a load at Port Arthur of 26,000 h.p., an increase of over 3,000 h.p. as compared with the corresponding period of the previous year.

Cheltenham.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £9,500 for boiler plant.

Cardiff.—ELECTRICITY EXTENSIONS.—The Electricity Committee has approved, for submission to the Finance Committee, a report submitted by the borough electrical engineer for extensions and replacements at the Roath and Hayes stations, and for mains and sub-station extensions. The report covers a period of two years, and the estimated cost of the extensions is £82,540.

Chester.—WIRING OF SMALL HOUSES.—The Electricity Committee is making application for sanction to borrow £3,000 for the wiring of small houses on the hire purchase system. The Committee has prepared a scheme whereby smaller dwellings may be wired at a cost not exceeding £10. It is proposed that the contractors should first of all have the opportunity of wiring the houses to a schedule prepared by the Committee at a profit. If the contractor does not agree, the Corporation will do the wiring. It is proposed that the occupier or owner should pay 1s. 10d. per £ of the expenditure per month, and in cases where tenants cannot repay in one year, the rates of repayment will be at 2s. 1d. in the £ spread over a period of three years.

MAINS EXTENSIONS.—New distributing mains are required in the eastern portion of the city and for that purpose it is proposed to lay a h.p. underground cable from New Crane street to a sub-station to be erected on land adjoining Hoole Lane, and to lay a further cable from the new sub-station to supply the Great Boughton district. New l.p. cables are also required and the cost of the whole work is estimated at £17,870. The Committee has recommended that application be made for sanction to borrow that sum. The recommendations have been approved by the Council.

Chesterfield.—ELECTRICITY SUPPLY.—The following matters were approved at the January meeting of the Electricity Committee:—A new e.h.p. feeder, to be laid to the Whittington Moor area, to duplicate the existing feeder; distribution mains to be extended to Handley Road, New Whittington; Hasland Green to the borough boundary; Highfield housing estate, and Hunloke Avenue, and overhead distribution in the Holymoorside rural area.

Continental.—GERMANY.—According to *The Times*, a Bill has been introduced into the Prussian Diet for appropriating the sum of 54,000,000 marks for extending the participation of the Prussian State in electrical works. The greater part of the amount has already been spent in acquiring interests in existing works. The proposal is part of a larger scheme of State control of electricity in Prussia.

SPAIN.—The Madrid correspondent of *The Times* reports that the Cabinet has approved the general lines of the new scheme of the Minister of Public Works for the better utilisation of the country's great hydro-electric resources. At present many new works are in course of construction, but owing to insufficient capital they are advancing very slowly. By lumping together the annual State payment towards these works for the next 25 years, the Minister hopes to speed up construction.

CZECHO-SLOVAKIA.—The Ceskomoravska Kolben Co. of Prague has recently completed a 20,000-kVA turbo-generator set for the power station at Seestadtl. The set, which runs at 3,000 r.p.m., is the largest of this type so far constructed in Czecho-Slovakia.

ROUMANIA.—According to a recently-issued report there were 133 central electricity stations in operation in Roumania at the end of 1924, of which 29 are operated by water power, 62 by internal-combustion engines, and the remainder by steam. The largest stations are those at Anina with an annual output of 19 million kWh; the Arad station (steam) with a capacity of 4,000 kW; and the Klausenberg station (steam, internal-combustion engine and water power) with a capacity of 3,200 kW.

AZERBAIJAN.—At a recent meeting of the Elektroplan, the question was discussed of the electrification of Azerbaijan. The plan submitted by the special commission provides for the gradual installation of hydro-electric works on the Araks, Kura, Terter and Samur rivers, the power of the individual works ranging from 30,000 to 60,000 kW.—*Reuter's Trade Service* (Moscow).

Dosthill (Staffs.).—ELECTRICITY SUPPLY.—A canvass of residents has been recently made resulting in applications for electricity supply being received from 95 per cent. of the householders. The Pooley Hall Colliery Co., Ltd., has decided to proceed immediately with the provision of a supply.

East Preston.—ELECTRICITY SUPPLY.—The Rural District Council has decided to consent to the Worthing Electricity Order on condition that the compulsory mains be extended to the villages of Angmering and Ferring, and that the price of electricity in the rural district should not exceed the price in the parish of Durrington.

Elland.—LOAN SANCTIONED.—The Urban District Council has received sanction to the borrowing of £1,000 for domestic apparatus to be let out on hire.

Epsom.—ELECTRICITY SUPPLY.—The Urban District Council has applied for sanction to a loan of £9,000 for renewing mains, and for approval to the installation of two 300-kW Diesel engines.

Gainsborough.—ELECTRICITY SCHEME.—The Council has received a report on the proposed electricity scheme. The cost of the plant is estimated at £8,561, mains and transformers, £10,105, and building, contingencies, and engineer's fees, £6,600. The report has been adopted.

Glasgow.—PROGRESS DURING DECEMBER.—The Corporation electricity manager reports that in December 103 houses were wired under the department's scheme, bringing the total to date to 1,709, while the number of applications for the hire of appliances was 529, making the total to date 9,603.

Glossop.—PURCHASE OF UNDERTAKINGS.—The Finance Committee of the Corporation has again considered the question of the purchase by the Corporation of the electricity and tramway undertakings of the Urban Electric Supply Co., Ltd., in the borough, and has received a report by the consulting engineer, Mr. R. Blackmore, on the proposal. The Committee has recommended the Council to purchase the undertakings at the price set out in the report.

Hastings.—ELECTRICITY AGREEMENT.—The Electricity Committee has entered into an agreement with the Rye Rural District Council for the supply of electricity to the rural district.

LOAN SANCTIONED.—The Committee has received sanction to the borrowing of £12,000 for mains and meters.

Hebden Bridge.—ELECTRICITY SUPPLY.—The Urban District Council is to consider at its next meeting the question of coping with the increased demand for electricity either by increased generation or by an additional bulk supply. In the meantime the Halifax Corporation is being asked to quote for an additional supply.

Irish Free State.—BLACKROCK (CO. DUBLIN).—The Free State Parliament has approved an Order under the Electricity Supply Acts in respect of a scheme for the township and district.

Lairg.—ELECTRICITY EXTENSIONS.—Extensions of the present electricity scheme are proposed and Mr. Claude Pain, in conjunction with Messrs. A. Hugh Seabrook & Partners, has been called in to advise.

Lancaster.—LOAN.—The Electricity Committee is applying for sanction to a loan of £12,500 for electricity purposes.

Leeds.—LOANS.—The Electricity Committee has received sanction to loans of £50,000 for sub-station equipment and £10,500 for sub-station buildings. Sanction is being sought for a loan of £1,600 for electricity services to 500 houses at Neaswood, Cross Gates, and Middleton.

Liverpool.—EXTENSION OF SUPPLY.—The following mains extensions have been authorised by the Corporation:—H.p. main from Smithdown Road sub-station to Lodge Lane sub-station, at an estimated cost of £12,383, and l.p. mains at an approximate cost of £8,295; extension of h.p. mains in Hawthorne Road, at an estimated cost of £1,378, and the provision of the necessary equipment in a sub-station at an approximate cost of £2,000 to supply industrial consumers.

PURCHASE OF UNDERTAKING.—Sanction has been received to the borrowing of £68,449 for the purchase of the undertaking of the Liverpool District Lighting Co., Ltd.

London.—SOUTHWARK.—The Electricity Committee has received sanction to a loan of £7,680 for mains, services, and plant.

Manchester.—PROGRESS DURING DECEMBER.—During the month of December the Corporation electricity undertaking showed an increase in connections of 2,424 kW, bringing the total to 275,836 kW; and the number of applications received for supply, including existing consumers for additional supplies, was 931, representing a total of 2,126 kW. The number of hired cookers connected increased by 108, bringing the total actually on circuit to 1,253. Applications for the hire of cookers totalled 91. One 750-kW converter was put into commission at each of the following sub-stations:—Whalley Range, Didsbury, West Didsbury, and Fallowfield. The Bowker Vale sub-station was also put into commission.

LOAN.—The Electricity Committee has recommended to the Corporation that application be made for sanction to a loan of £50,000 for equipment for distributing stations.

Nantwich.—ELECTRICITY AGREEMENT.—The Urban District Council has approved a draft agreement with the Gwynedd Trust, Ltd., for the supply of electricity to the town.

Newton Abbot.—APPLICATION FOR ORDER.—The Rural District Council having refused its formal consent to an application for an Order to supply electricity in the rural area by the Teignmouth Electric Lighting Co., Ltd., the latter has appealed to the Electricity Commissioners to dispense with the Council's consent.

Rawtenstall.—YEAR'S WORKING.—We have received from Mr. C. L. E. Stewart, borough electrical engineer, a copy of the accounts of the electricity undertaking for the year ended March 31st last. A summary of the accounts shows that there was a total income of £54,470, as compared with £54,032 in the preceding year. Working expenses were higher at £28,425, as against £27,479, and there was a gross profit of £26,045 (£26,553). After deducting capital charges there was a net surplus of £6,368, as compared with £6,339 in 1923-24. The sales of electrical energy increased from 9,140,752 to 9,577,834 kWh, and the average price per kWh obtained fell from 1.367d. to 1.30d.

Reigate.—Opposition to Bill.—The Town Council has decided to petition against the Bill of the Metropolitan Electric Supply Co., Ltd., which seeks powers to supply within the Council's area and adjacent districts, on the ground that it would be unfair for the company to be given legal powers to compete with the Corporation, which has lately spent a large sum on the development of its undertaking.

Sheffield.—Electricity Extensions.—The Electric Supply Committee has approved extensions and works at an estimated cost of £5,608, and extensions of mains for general distribution purposes at an estimated outlay of £17,831.

Linking Up.—An arrangement has been entered into for the linking-up of the electricity undertakings of the Sheffield and Rotherham Corporations with a cable for an interchange of supply of 10,000 kW, and the agreement provides for an emergency supply of electricity being given by one Corporation to the other. Rotherham Corporation has agreed to allot to the Sheffield Corporation stand-by plant of a capacity of 10,000 kW, and for this service the Sheffield Corporation will make an annual payment. Sheffield Corporation may take from Rotherham a supply of electricity in bulk not exceeding 25 million kWh per annum, with a minimum of five million kWh. The linking-up cable, with subsidiary apparatus, will cost between £40,000 and £50,000, and the cost of this work, as well as the cost of maintenance, will be equally divided between the two Corporations. The agreement is to remain in force for five years from the date of the actual linking-up. The general manager of the Sheffield electricity undertaking reports that by this agreement the extension of the generating station at Blackburn Meadows can be postponed.

Southport.—Domestic Appliances.—The Electricity Committee has received sanction to the borrowing of £5,000 for the purchase of domestic electrical appliances to be hired to the public. The Committee has authorised its electrical engineer to purchase domestic appliances for hire-purchase at a cost not exceeding £2,000 from revenue account.

Loan.—The Town Council is applying for sanction to a loan of £25,000 for strengthening the network of cables in the town and erecting distributing kiosks in different parts of the district.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Sidmouth Urban District Council for authority to supply electricity to certain parishes in the rural district of Honiton; Cement Houses, Ltd., for the supply of electricity in the boroughs of Southend-on-Sea, Chelmsford, and Maldon, the urban districts of Burnham-on-Crouch, and Shoeburyness, and the rural districts of Rochford, Chelmsford, and Maldon.

The Bynamman and District Electric Supply Co., Ltd., has applied for certain amendments to be made in the draft of the Bynamman and District Electricity Order.

United States.—Hydro-Electric Development.—According to *Power*, a station now under construction on King's River in Central California is to operate under an ultimate static head of 2,470 ft. It will be the highest-head hydro-electric plant in America. The San Joaquin Light & Power Corporation expects to have the station in operation within a year. The entire King's River project will involve the expenditure of $50,000,000. The plant will include four of the largest horizontal waterwheel generators in the country. The first of these units, rated at 33,000 kVA, 13,200 V, is being made by the American General Electric Company.

The Philadelphia Electric Co.'s petition for approval of its $52,000,000 hydro-electric scheme, at Conowingo on the Susquehanna River, was allowed on January 12th by the Pennsylvania Public Service Commission. The Public Service Commission of Maryland has already passed the project, and the permission of the Federal Power Commission will probably be forthcoming shortly.

Whitchurch.—Application for Order Approved.—The Urban District Council has decided to support the application of the Gwynedd Trust, Ltd., for powers to supply electricity in the Council's area.

Tramway and Railway Notes.

Continental.—Belgium.—Work is well in hand on the electrification of the local railway between Brussels and Ninove. The section as far as Schepdael is already in operation, and it is anticipated that the complete line will be finished by the autumn. In connection with the work the Société Nationale des Chemins de Fer Vicinaux, of Brussels, is about to invite tenders for the establishment and equipment of a transformer sub-station at Eyseringhen.

The Société d'Electricité de l'Escaut of Antwerp, has recently entered into a contract to supply the whole of the electrical energy required for the operation of the tramway of the Antwerp General Tramways Company.

Switzerland.—It is reported from Berne that the Swiss Federal Railway authorities have recently given orders for 48 additional express electric locomotives. Twenty are to be built by Brown, Boveri & Co., of Baden, 26 by the Oerlikon Maschinenfabrik, Oerlikon, and two by the Ateliers de Sécheron, of Geneva. The last-named company has also secured an order for the electrical equipment of 16 eight-wheel rail motor coaches.

Work is about to be commenced on the construction of an electrically-operated cable railway between Burglen, near Altdorf (Canton of Uri) and the summit of the Kingzig. The line will be about 1¼ miles in length.

France.—As a result of the satisfactory experiments with the block system of luminous signals on the Asnières-Argenteuil line, the French State railway authorities have decided to adopt it on the Becon-les-Bruyeres-Saint Germain-en-Laye section (10 miles) of the Paris-St. Germain railway, which is at present in course of electrification.

Croydon.—Route to be Abandoned.—The Borough Council, on February 1st, decided to abolish the Addiscombe tramway system, and to complete negotiations for an omnibus service on and beyond that route.

New Service.—A through service of L.C.C. tramcars between Victoria Embankment and Croydon and Purley was commenced on February 7th. The length of the route is 14 miles.

Farnworth.—Tramway Agreement.—The Urban District Council, on February 3rd, entered into an agreement with the South Lancashire Tramways Co. for the working, use, maintenance and management of the Council's tramway for a further 21 years as from April, 1927. The company will maintain the track, and take its electricity supply from the Council's electricity undertaking, and the Council is to receive 5 per cent. of the net profits.

India.—Calcutta.—The Government has approved the draft agreement with the Calcutta Tramways Co., Ltd., for the construction of a tramway along the main sewer road from Russia Road South to Ballygunge railway station.

Bombay.—The Bombay Electric Supply & Tramways Co. is to introduce a railless-car service on one of the tramway routes. The scheme has received the consent of the Corporation.

Keighley.—Railless Cars.—The last of the tramway track was formally removed by the Mayor on February 4th. The heavy cost of track maintenance was the chief cause of the change last year, and Keighley was the first town in the country to abolish tramways entirely and substitute railless-cars.

London.—New Subway.—The Corporation of London and the Metropolitan District Railway Co. have come to an arrangement for the construction of a subway to link up Blackfriars Station and the public ways at Blackfriars Bridge.

Southern Railway Electrification.—The Southern Railway Co. has announced that Cannon Street Station will be closed from June 5th to June 28th, in order to enable the work of reconstruction in connection with the electrification of the railway to be proceeded with night and day. From June 28th to July 10th a modified steam and electric service will be run from Cannon Street Station.

From February 28th temporary electric services will be introduced between Charing Cross and Cannon Street and Orpington, and from June 6th temporary electric services will be introduced between Charing Cross and Dartford.

Stoke.—Abolition of Tramways.—At a recent meeting of the City Council the refusal of the Ministry of Transport to support the Council's action in declining to grant additional omnibus licences to the Potteries Electric Tramways Co. was discussed, and it was decided to appoint a special committee to negotiate with the company on the matter of both tramways and omnibuses with a view to the abolition of tramways if possible.

Telegraph and Telephone Notes.

China.—New Wireless Station.—It is reported that a radio station is being constructed at Paotouchen, Suiyuan Special Administrative Area, and the work is expected to be completed shortly.

Denmark.—Telegraph Service.—According to the recently-issued report for the year ending March 31st, 1924, by the Danish Telegraph Authorities, the telegraph system in Denmark at that date comprised 5,388 miles of overhead lines, 525 miles of submarine cables, and 238 miles of underground lines—a total of 6,151 miles.

Hull.—Telephone Profits.—A report presented to the Hull Corporation Telephone Committee showed that the profit on the telephone undertaking for the current financial year would exceed £12,000, after allowing for payment of royalties to the Government amounting to £10,900. The Hull Corporation is the only municipality in the kingdom to own a telephone undertaking, and the tariffs are the lowest.

Exchange Extension.—The Municipal Telephone Committee has authorised the provision of additional switches at the Queen's Road exchange, at a cost of £580.

Pacific Cable Board.—CANADA'S THREAT TO WITHDRAW.—Mr. Charles Murphy, Postmaster-General, announces that he has notified the Pacific Cable Board that he will recommend Canada's withdrawal from partnership with Great Britain, Australia, and New Zealand, if the Board persists in the duplication of the Pacific cable between Fiji and Canada.—*Reuter* (Ottawa).

In the Canadian House of Commons, Sir George Perley asked for an assurance from the Government that no such step would be taken without at least first consulting Parliament. Mr. Lapointe, acting leader of the Government, said that correspondence was still proceeding with the Cable Board, and he hoped that an amicable settlement would be reached.—*Reuter* (Ottawa).

Poland.—TELEPHONISTS' STRIKE.—The Inter-Ministerial Commission of Arbitration, which had been summoned to settle the differences of opinion between the telephone operators and their employers at Warsaw, gave its decision on February 4th. The Commission censures the arbitrary conduct of 14 telephonists with regard to their employers, and requests them to return to work at a reduced salary for two months. The manager of the Telephone Company, who had assumed control on behalf of the State, has communicated the details of this decision to the directors of the Telephone Company.—*Reuter* (Warsaw).

Switzerland.—NEW AIRCRAFT STATION.—A wireless telegraph reception and transmission station is to be installed at the aerodrome at Dubendorf, near Zurich.

The Telephone Service.—NEW EXCHANGE AT SALFORD.—Employment for a period of 12 months will be provided for 200 men by the erection of a new telephone exchange at Salford, the largest building undertaking that Manchester has seen for many years. Involving an expenditure of £250,000 and occupying a floor space of six acres, the structure, when completed, will be fitted with apparatus of the automatic type; the building is to be steel-framed throughout, and the 4,000 tons of steelwork required is to be fabricated at the Trafford Park works of Messrs. Edward Wood & Sons.

Radio Notes.

Concerts in the Air.—AIRCRAFT RECEPTION.—Wireless concerts for air travellers were inaugurated on the Paris-London airway on February 1st, when all the passengers by the Air Union noon aeroplane from Le Bourget enjoyed a concert broadcast by the Radio-Paris station.

Daventry.—DISTORTION.—Capt. P. P. Eckersley, chief engineer of the B.B.Co., replying to a letter in *The Times* from a correspondent complaining of unpleasant distortion from the Daventry station, says: "We have had several letters to the same effect. While not wishing to shirk responsibility, it can be proved that, given certain methods of reception, no serious distortion is apparent. This condition is admittedly dependent upon a greater factor of safety in the receiving set than that necessary with short waves. We find that the overwhelming majority of complaints (numbering 150 out of the estimated 100,000 listeners to Daventry) come from users of sets other than crystal. 'Low tone' distortion is often produced by heavy receiver reaction effects, and this, coupled with the fact that we are using a microphone which brings in the 'low' tones more pronouncedly than former types, suggests that our theory of the trouble can be supported, at least, reasonably. It may be, however, that under-modulation in the transmitter caused by some spurious effect would result in the necessity of listeners using more reaction in the receiver than heretofore. Our standard tests have not revealed any defect in the circuits which would account for a lack of modulation, but in order definitely to prove whether some undiscovered effect is present, we are carrying out certain experiments to check performance and to assure ourselves that responsibility for the trouble does not lie with us. My own opinion at the present moment is that the effect is only apparent because of the introduction of a more perfect over-all frequency response in the transmitter, which 'shows up' badly in those receivers which for their sensitivity rely too much upon the use of reaction. Another type of distortion is dependent upon the interference between direct and indirect rays from the station, but this effect, bound up with fading, will only be apparent at very long ranges, upwards of 200 miles. We have no control over this type of distortion except in attempting to keep our wave-length perfectly steady. We have never, and never will, adopt a policy of over-modulating transmitters in the interests of long-distance listeners, and to the detriment of good quality."

Finance.—POST OFFICE PAYMENTS.—Details of the additional money required by Government Departments to cover expenditure which they will have incurred by the end of the financial year in excess of the amount already voted are given in a list of supplementary estimates which was issued last week. The Post Office demands another £847,000, of which sum £223,000 is needed to meet increased payment to the British Broadcasting Co., Ltd.

France.—PROPOSED "LUXURY" TAX.—Many protests have been raised against the proposed new taxes on wireless apparatus, which is classed as a luxury. The French Wireless Union has unanimously adopted a resolution pointing out that wireless is by no means a luxury, as 90 per cent. of the sets belong to modest employés and workers; that it is a powerful element in furthering social progress, and that still wider development of wireless would bring into the Treasury greater resources than the proposed tax, which would restrict such development. The resolution expresses the determination to oppose any tax on ordinary sets, the price of which does not exceed 2,000 fr.—*Reuter* (Paris).

Iceland.—NEW STATION.—The new broadcasting station at Reykjavik has begun testing operations. According to the *Evening News* it transmits at 11 p.m. on a wave-length of 430 metres. The transmitter, which is to be under official control, works on a power of 500 watts, and was installed by Standard Telephones & Cables, Ltd. (Western Electric Co.), one of whose engineers is at present in charge of the station.

Licences.—PROSECUTION.—Supporting a licence prosecution at Willesden, London, on February 4th, a Post Office representative said that defaulters, under the new Wireless Act, committed two offences, and accordingly two summonses were being issued in each case William Boyd, of Cricklewood, was summoned for installing a wireless set without a licence, and for working it without a licence. He pleaded guilty, and the magistrates fined him 10s. for each offence, and said that future offenders would be more severely dealt with.

Spain.—NEW STATION FOR BARCELONA.—The Casa del Aficionado, of Barcelona, manufacturers of wireless telephone material, is about to install a wireless station at Barcelona. This station will be the fourth in that town.—*Reuter's Trade Service* (Madrid).

The Wireless Association.—A NEW CLUB.—The above-named Association, which aims, apparently, at assuming a similar position to that of the Automobile Association in motoring circles, requires its members to sign a pledge that they will refrain from oscillating during broadcasting hours. Amongst the services it proposes to afford its members are accumulator charging at low rates, the hire of receiving sets, technical repair and advice (personal or by post), legal service, and special insurance rates.

United States.—FARMERS' WIRELESS TELEPHONY.—The Sears Roebuck Agricultural Foundation at Dallas recently sent questionaires to farmers in Texas, Oklahoma and Louisiana, asking them to name the benefits received from radio reports. Five hundred replies were recived, of which 163 listeners said that radio service saved them money each year; the average saving was 148.64 dollars per family. Market reports were considered to be the greatest financial advantage.—*Reuter's Trade Service* (Chicago).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—SYDNEY.—March 31st. New South Wales Government Railways. One air compressor for Zarra Street power house.

April 21st. Four motor-generator sets and four switch-operating batteries for Hornsby and St. Leonards sub-station. Specifications from Chief Electrical Engineer, 61, Hunter Street, Sydney.

MELBOURNE.—April 7th. City Electrical Department. One 2,000-kW rotary converter, with transformer and accessories,* d.c. switchgear and accessories, and one a.c. control panel.*

April 7th. Victorian Government Railways. One hydraulic plate-bending press.*

Aylesbury.—February 16th. Electricity Department. Overhead 11,000-V transmission lines and cables. (January 22nd.)

Belfast. — February 20th. Electricity Department. Twelve months' supply of stores, including electrical accessories, lamps, carbon brushes, electricity meters, &c. (January 29th.)

Belgium.—February 24th. The Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. Telephone switchboard, with c.b. and luminous signals, &c., for the central regional and interurban telephone exchange at Verviers. Particulars (cahier des charges special No. 3,160) for 8¼ fr.

Bristol.—February 25th. Board of Guardians. Electrical fittings for six months. Mr. T. S. Lamb, clerk, St. Peter's Hospital.

Cardiff. — February 22nd. Electricity Department. Twelve months' supply of paper-insulated cables, one 1,500-kW rotary converter, and one 2,000-kW ditto. (February 5th.)

March 8th. One 10,000-kW turbo-alternator and condensing plant. (February 5th.)

Cheadle and Gatley.—February 15th. Electricity Department. E.h.p. and l.p. switchgear. Specification from Electrical Engineer and Manager, 37, High Street, Cheadle, Cheshire.

Clitheroe.—February 23rd. Corporation. Transformers, switchgear, and cable connections for sub-station; e.h.p. and l.p. cables, boxes, &c. (January 15th.)

Dundee.—Town Council. Electrical work in connection with 60 Corporation houses. Particulars from Mr. Geo. Baxter, Director of Housing, 91, Commercial Street, Dundee.

Edinburgh.—March 8th. Electricity Supply Department. One 25,000-kW turbo-alternator with condensing plant, or, alternatively, one 20,000-kW turbo-alternator with condensing plant. (February 5th.)

February 16th. One 750-kW motor converter for Leith Substation. (February 5th.)

Halifax.—February 20th. Markets and Parks Committee. Electrical engineering work in connection with the erection of the public abattoirs. Particulars from Borough Engineer, Crossley Street.

Hull.—February 15th. Tramways Committee. Stores required during year ending March 31st, 1927, including carlighting fittings, lamps, cable, and switches. Form of tender, &c., from General Manager, Tramway Offices, Albion Street, Hull.

Leicester.—Electricity Department. One 18,750-kW, 3-phase turbo-alternator, with condensing plant. (See this issue.)

London.—London County Council.—February 22nd. H.p. switchgear for Lewisham tramway sub-station. (January 22nd.)

St. Pancras.—March 2nd. Electricity Department. E.h.p. switchgear at the Grafton Road sub-station. (February 5th.)

Metropolitan Asylums Board.—February 24th. Installations of electric lighting at the Upper Southern Convalescent Fever Hospital and the Joyce Green Hospital, Dartford. Installation of kitchen fittings and appliances at the North-Western Fever Hospital, Lawn Road, N.W.3. (See this issue.)

Manchester.—February 16th. Tramways Committee. Permanent-way points, tongues and crossings and general stores. Schedules from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly.

February 23rd. Steelwork for permanent way and parcels depôt.

Board of Guardians. February 13th. Electric lighting at Cottages Homes, Styal, Handforth. February 19th. Electric bed lifts at new pavilions, Booth Hall Infirmary, Charlestown Road, Blackley. Particulars from Mr. F. H. Overmann, architect, 183, Oxford Road, Manchester.

Morley.—Borough Council. Electrician's work in erection of 56 houses, Middleton Road estate. Particulars from Mr. F. Turner, borough engineer, Town Hall.

Newark-upon-Trent.—March 1st. Corporation. Two electrically-driven centrifugal pumps. (February 5th.)

Perth.—February 17th. Corporation. Electric lighting installation at 84 houses. Plans from Burgh Surveyor.

Plymouth.—February 17th. Electricity Department. Twelve months' supply of electricity meters, cables and transformers. (January 29th.)

Retford.—February 19th. East Retford Gas, Water and Electricity Department. Electricity generating plant, mains, transformers, and meters. (January 22nd.)

Richmond-on-Thames.—February 22nd. Town Council. Electrically-driven centrifugal pump, with motor, switchgear, &c. Mr. Hugh P. Williamson, water engineer, Riverside.

Salford.—February 18th. Electricity Department. Coal supplies required during six months commencing March 1st, 1926. Particulars from Borough Electrical Engineer, Frederick Road, Salford.

South Africa.—Johannesburg.—February 25th. Municipal Council. Four d.c. switchgear panels and 3-phase, truck-type ironclad switchgear panels.*

February 25th. S.A. Railways and Harbours. Two 4-ton electrically-driven fixed wharf cranes for Luderitz jetty.*

One 7-ton and five 4-ton electrically-driven portal cranes, complete.*

Electrification of Cape Town Suburban Railway. Supply and erection of the overhead equipment of the permanent way and overhead transmission and distribution lines. (See this issue.)

Pretoria.—February 25th. Postmaster-General's Department. Supply of a manual telephone exchange for Hatfield, Pretoria. Controller of P.O. Stores, Pretoria.

February 25th. Union Tender Board. Miscellaneous telegraph and telephone materials (C×1880).*

Cape Town.—March 17th. Electricity Department. Electric cables, electric light poles, cross arms, insulators, &c.

Mooreesburg.—March 20th. Municipal Council. Engine-room equipment, including oil engines and tanks, main generators, motor booster, pumps and air compressor, travelling crane, switchboard, battery and connections, distribution system, instruments, meters, &c.; and house service connections.*

Spain.—Madrid.—La Junta de Obras del Puerto de Castellón de la Plana. A 3-ton electric crane.—*Reuter's Trade Service* (Madrid).

Sutton Coldfield.—February 17th. Electricity Department. E.h.p. underground main, rotary converting plant and switchgear, and automatic rotary converting plant and switchgear, or mercury-arc rectifiers. (February 5th.)

Watford.—February 23rd. Board of Guardians. Electric lighting installation, consisting of wiring old buildings, new power mains, motors, main switchboard, &c. Specifications from the Master's office, 60, Vicarage Road, Watford, or from the consulting engineer, Mr. W. M. Benny, 39, Carlton Road, Putney, S.W.15.

Wrexham.—February 18th. Electric lighting installation at Miners' Hall and Institute, Rhos. Specification from Mr. J. Owen and Mr. F. A. Roberts, architects, Westminster Bank Chambers, Wrexham.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Birkenhead.—Electricity Committee. Accepted:—

1,500-kW rotary converter (£5,417); and 750-kW converter (£3,272).—Metropolitan-Vickers Electrical Co., Ltd.

Cable.—Hackbridge Cable Co., Ltd. (£2,139); Macintosh Cable Co., Ltd. (£116); W. T. Henley's Telegraph Works Co., Ltd. (£1,140).

Two 200 kVA transformers (£355).—General Electric Co., Ltd.

Switchgear for Bromborough sub-station.—Ferguson, Pailin, Ltd. (£948); English Electric Co., Ltd. (£222).

Switchgear for Beaufort Road sub-station (£100).—British Thomson-Houston Co., Ltd.

Bradford.—Tramways Committee. Accepted:—

58 steel gear wheels and 60 steel pinions for tramcars (£522).—David Brown & Sons (Huddersfield), Ltd.

Three one-man electric trolley vehicles (£1,445 each).—Associated Equipment Co., Ltd.

Three ditto (£1,530 each).—Richard Garrett & Sons, Ltd.

Electricity Committee. Accepted:—

One auxiliary motor-generator for Valley Road generating station.—Crompton & Co., Ltd.

Markets and Fairs Committee. Accepted:—

Illuminated signs at Kirkgate and Rawson Place Markets.—J. Akers (10 signs, £186); wiring signs (£163).—Smith & Croft.

Great Horton Co-operative Society, Ltd. Accepted:—

Electrical installation at new branch store, Brownroyd Hill.—A. Higginbotham & Son.

Bury.—The Town Council has decided to complete agreements with the English Electric Co., Ltd., and the General Electric Co., Ltd., in connection with the conversion of eight bogie cars, and with the De Laval, Chadburn Co., Ltd., for the supply of an oil purifier to the electricity department.

Chesterfield.—Electricity Committee. Accepted:—

E.h.p. and l.p. cables (£3,164).—Macintosh Cable Co., Ltd.

E.h.p. switch cubicles (£271).—British Thomson-Houston Co., Ltd.

Cornforth.—The Parish Council has accepted the tender of Wilson Fleetham, Coxhoe, at 8s. per lamp per annum for cleaning, maintaining and repairing and providing and fixing bulbs required for 140 electric street lamps.

Derby.—Tramways Committee. Accepted:—

Six car bodies, roof covers, and trucks (£7,050).—Brush Electrical Engineering Co., Ltd.

Six electrical equipments (£3,737).—British Thomson-Houston Co., Ltd.

Durham.—County Council. Accepted:—

Telephones at premises, Old Street (£78).—Kelly & Co.

Electric lighting installation at school at Tursdale (£113).—Reid, Ferens and Co.

Eastbourne.—Electricity Committee.

2,500-kW turbo-alternator:—

Oerlikon, Ltd.	£12,021
Escher, Wyss-Boveri	12,024
English Electric Co., Ltd.	12,108

Commutators.—P. R. Jackson & Co., Ltd.

Car chains (brake).—Weldless Chains, Ltd.

Hastings.—Electricity Committee. Accepted:—

H.p. switchboard at Shepherd Street sub-station (£464).—Ferguson, Pailin Ltd.

Hull.—Tramways Committee. Accepted:—

Two switches, 100 ft. radius (£94); and one switch, 130 ft. radius (£58).—Hadfields, Ltd.

Liverpool.—Water Committee. Accepted:—

Electrically-driven centrifugal pump for Dudlow Lane pumping station (£1,490).—W. H. Allen, Sons & Co., Ltd.

Irish Free State.—The following contracts were among those placed by the Controller of Stores, Department of Posts and Telegraphs, Dublin, from December 21st to January 22nd, inclusive :—

Cable.—Siemens-Schuckert (Ireland), Ltd.; and W. T. Henley's Telegraph Works Co., Ltd.
Cable switchboard.—W. F. Dennis & Co.
Dry cells.—Edison Swan Electric Co., Ltd.; and Allen Liversidge, Ltd.
Porous Leclanché cells.—Siemens Bros. & Co., Ltd.; and General Electric Co., Ltd.
Platinum contacts.—Marconi's Wireless Telegraph Co., Ltd.
Jointing sleeves.—Dugard Bros., Ltd.
Telephone keys.—Sterling Telephone & Electric Co., Ltd.
Telephone relays.—Standard Telephone & Cables Co., Ltd.; British L. M. Ericsson Mfg. Co., Ltd.; International Electric Co., Ltd.
Tungar battery charger and parts.—British Thomson-Houston Co., Ltd.
Fuseboards.—Standard Telephones & Cables, Ltd.
Generators.—Siemens Bros. & Co., Ltd.
Enamelled and flameproof wire.—S. G. Leach & Co., Ltd.
Switchboard wire.—Celtic Electric Co.
Zinc rods (Leclanché).—Eyre Smelting Co., Ltd.—*Irish Builder and Engineer.*

Leeds.—Tramways Committee. Accepted:—

Points, crossings, and special work.—Edgar Allen & Co., Ltd. (£2,201); Thermit, Ltd. (£247).

Electricity Committee. Accepted :—

Cable.—W. T. Henley's Telegraph Works Co., Ltd. (£3,955); Enfield Cable Works Ltd. (£1,346); Macintosh Cable Co., Ltd. (£370).

Sewage Committee. Accepted :—

Electric lighting work at Thorpe Stapleton pumping station (£202).—Wilson Hartnell Installations, Ltd.

London.—ADMIRALTY.

3,300 accumulators.—Edison Swan Electric Co., Ltd.

HACKNEY.—Electricity Committee. Recommended :—

Air compressor (£110).—Reavell & Co., Ltd.
One Weir turbine feed pump (£525).—G. & J. Weir, Ltd.

HAMMERSMITH.—Electricity Committee. Accepted :—

Two 250-kW oil-cooled transformers (£400).—Hackbridge Electric Construction Co., Ltd.

METROPOLITAN ASYLUMS BOARD.—Works Committee.—The following tenders were received for the installation of electric lighting at Darenth Training Colony :—

Read & Partners, Ltd.	£8,192
Kershaws	8,431
Brightside Foundry & Engineering Co., Ltd.	9,040
S. Dixon & Son, Ltd.	9,750
T. Clarke & Co., Ltd.	10,000
Toy & Winslow	10,285
Direct Electric Service (Bury), Ltd.	10,380
Coley & Swinnerton, Ltd.	10,425

Maidenhead.—Town Council. Accepted:—

Electric fire siren (£83).—S. G. Leach & Co., Ltd.

Manchester.—Electricity Committee. Accepted:—

Two 750-kVA static transformers.—Hackbridge Electric Construction Co., Ltd.
3-phase induction regulator.—English Electric Co., Ltd.

Tramways Committee. Accepted :—

Trial equipment of "Maley" electro-pneumatic brake on tramcar.—Electro-Mechanical Brake Co., Ltd.
Steel girder tramway rails.—Cargo Fleet Iron Co., Ltd.

Education Committee. Accepted :—

Electric lighting at Ashton Road clinic.—Harrisons, Ltd.
Rearrangement of electric lighting at Ashton school.—R. Seddon & Sons.

Navan.—County Meath Board of Health. Accepted:—

Electric lighting installation at new County Hospital (£310).—Gilbert Bros. (11 tenders were submitted.)

Plymouth.—Health Committee. Accepted:—

Dynamo at sanatorium (£60).—W. H. Heath & Co.

Salford.—Tramways Committee. Accepted:—

30 fully-enclosed top covers, including new seats and canopies, and 60 lower vestibule ends and staircases for small cars (£18,930).—Massey Bros.

Southampton.—Education Committee. Accepted:—

Installing electric lighting at the new Taunton school (£928).—Groves and Co.

Forthcoming Events.

Physical Society of London.—Friday, February 12th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Annual general meeting.

Institution of Engineering Inspection.—Friday, February 12th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "The Application of Special Cast Irons in the Engineering Industry," by Mr. S. E. Dawson.

Electrical Engineers' Ball.—Friday, February 12th. At the Hotel Cecil, Strand, W.C.

British Electrical and Allied Industries Research Association.—Friday, February 12th. At the Savoy Hotel, Strand, W.C. Annual general meeting and luncheon.

Junior Institution of Engineers.—Friday, February 12th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecture on "A Visit to Some Power Stations in the U.S.A. in 1925," by Mr. W. H. Patchell.
Saturday, February 13th. At Holborn Hall. From 7.30 to 11 p.m. Annual dance.

Electrical Trades Commercial Travellers' Association.—Saturday, February 13th. At the Manchester Hotel, E.C. At 6.30 for 7 p.m. First annual dinner.

British Industries Fair.—February 15th to 26th. At the White City, London, W., and the Castle Bromwich Aerodrome, Birmingham.

Association of Mining Electrical Engineers (London Branch).—Tuesday, February 16th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 6.30 p.m. Paper on "Mining Signalling Apparatus and Telephones," by Mr. O. D. Kennedy.

Royal Society of Arts.—Wednesday, February 17th. At John Street, Adelphi, W.C.2. At 8 p.m. Lecture on "The Propagation of Electric Waves," by Mr. J. E. Taylor.
Monday, February 15th. At 8 p.m. Cantor Lecture on "The Production and Measurement of High Vacua," by Dr. G. W. C. Kaye.

Edinburgh Electrical Society.—Wednesday, February 17th. At the Royal Scottish Society of Art, 117, George Street. At 8 p.m. Paper, "A Talk on Cables," by Mr. F. Stevenson.

Poplar School of Engineering, Old Boys' Society.—Wednesday, February 17th. At the School of Engineering, High Street, Poplar, E. At 7.45 p.m. Paper on "Present-day Development in the Electrical Supply Industry," by Mr. O. L. Robson.

Institution of Electrical Engineers.—Thursday, February 18th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Joint meeting with the British Section of the French Society of Civil Engineers. Paper on "The Electrification of the Paris-Orleans Railway," by M. Parodi
(Mersey and North Wales (Liverpool) Centre).—Monday, February 15th. At the University, Liverpool. At 7 p.m. Paper on "Dielectric Problems in High-Voltage Cables," by Capt. P. Dunsheath.
(North-Western Centre).—Tuesday, February 16th. At the Milton Hall, Deansgate, Manchester. At 7.30 p.m. Joint meeting with the Institution of P.O. Electrical Engineers. Lecture on "Wireless," by Mr. E. H. Shaughnessey.
(Scottish Centre).—Wednesday, February 17th. At the Grosvenor Restaurant, Glasgow. Semi-Jubilee function (Ladies' Evening), dinner, whist and dancing.
(South-Midland Centre).—Wednesday, February 17th. At the University, Birmingham. At 7 p.m. Paper on "The Electrification of the Paris-Orleans Railway," by M. Parodi.
(Tees-Side Sub-Centre).—Monday, February 15th. At the Cleveland Technical Institute, Middlesbrough. At 7.15 p.m. Paper by Mr. C. W. Blacklock.
(North-Midland Students' Centre).—Tuesday, February 16th. At the Technical College, Bradford. At 7 p.m. Paper on "Storage Batteries for Power-station Service," by Mr. C. A. Wilson.

Diesel Engine Users' Association.—Friday, February 19th. At Caxton Hall, Westminster, S.W.1. Paper on "Heavy Oil Engine Installations—Choice of Site and Lay-out of Plant," by Mr. G. Porter.

Manchester Electro-Harmonic Society.—Friday, February 19th. At the Albion Hotel, Piccadilly, Manchester. Concert.

British Electrical Development Association Conference.—Friday, February 19th. At Caxton Hall, Westminster. Lecture on "The Electrical Industry and the Architect," by Mr. G. Blair Imrie.

Institution of Mechanical Engineers.—Friday, February 19th. At the Institution, Storey's Gate, S.W. At 6 p.m. Annual general meeting. Paper on the "Measurement of Cutting Temperatures," by Mr. E. G. Herbert.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

Moulded candles having imitation "tears" at the top and sides.

Lighting cables and sockets suitable for the external lighting of ships when illuminated in connection with regattas or other special occasions.

Notes.

Appointments Vacant.—The United River Plate Telephone Co. requires several engineers for its permanent staff in Buenos Aires; draughtsman (£337), for the City of Birmingham electricity department; combustion engineer (£327) and assistant power station superintendent (£360), for the Borough of St. Helens electricity department; wireman, for the Cornwall Mental Hospital, Bodmin; meter superintendent (£208), for the Nuneaton Corporation electricity department; shift charge engineer, for the Mersey Power Co., Ltd. (See our advertisement pages to-day.)

The Hastings Hum.—With regard to the "hum" which, it was alleged by the lay Press, was annoying the residents at Hastings, we have ascertained from the borough electrical engineer, Mr. Russell F. Ferguson, that it was caused through the ash pit acting like a loud speaker. The ash pit tapers down from the front, and then continues with a gentle slope to the back; the remedy was to put in concrete so as to make a gradual slope from the front to about 10 in. under the chain-grate stoker at the back. The cause of the trouble was discovered by a member of the operating staff, and by placing corrugated sheet iron underneath the stokers, the correct angles which suppressed the sound were found. The matter was very simple, once the spot where the trouble lay had been localised.

Boiler Explosion Report.—We have received a copy of the report of a preliminary inquiry on the explosion from a water tube boiler at the West Ham generating station on April 29th last. The boiler was made by the Stirling Boiler Co., Ltd., in 1920, and was first put on commercial load at West Ham in 1922. One of the front-row tubes burst, forming an aperture 13.5 in. long and 7.5 in. wide (maximum). The contents of the boiler escaped through the opening, projecting flames and vapour from under the grate to the boiler opposite. The tube immediately behind that which failed was bent backwards by the force of the explosion. The latter appears to have been the result of over-heating, the cause of which was removed when the tube failed. The tube which failed had only been in service for about ten weeks and the quantity of scale found in any part of it did not exceed 1/32 in. The tube had also bulged both in the solid and fractured parts.

Local Society.—A lecture on "The Influence of Light in Industry and Commerce" was delivered before the Edinburgh Electrical Society on February 3rd by Mr. H. E. Hughes, of the Scottish Electric Lighting Service Bureau. The developments were traced and comparisons made of artificial lighting from the carbon lamp up to the present day manufacture. Raw or glare light was condemned and the proper reflection and control of light explained. Industrial and shop lighting methods were discussed and a number of excellent lantern slides shown.

Ontario Hydro-Electric Power. — The December *Bulletin* of the Hydro-Electric Power Commission of Ontario shows that the Commission's various plants have a total capacity of 942,028 h.p. This figure is very close to the ultimate development contemplated, which is given as 1,068,728 h.p. The Niagara system possesses the bulk of the plant (788,500 h.p.), and only 10,000 h.p. remains to be developed there under present arrangements. A further 25,000 h.p. is being harnessed at the Thunder Bay system, and 10,500 h.p. at the Georgian Bay system.

French Scientific Activities.—We are informed that the fiftieth anniversary of the birth of the "Association pour l'Avancement des Sciences" will be celebrated at the 1926 Congress of the Association which is to be held at Lyons. Between July 24th and August 1st there will also be held a large international exhibition in the Fair Palace, Lyons, representing all that relates to applied science.

G.E.C. Research Laboratories' Visit.—At the invitation of the General Electric Co., Ltd., a large party of science masters attending the Annual Conference of the Science Masters' Association in London, recently visited the G.E.C. Research Laboratories at Wembley, and were conducted through the various testing and experimental rooms. Particular interest was shown by the visitors in the work in progress in the vacuum physics laboratory and the experimental tungsten wire model factory. A special party visited the Osram lamp works at Hammersmith; over 200 members accepted the invitation extended to the Association.

A Lady Demonstrator at Home.—The accompanying illustration depicts what might be a lounge in a comfortable country mansion. But it is not; it is a section of the Hackney

A Lady Demonstrator "At Home."

electrical demonstration halls, with Mrs. A. M. Pearmain, the supervisor of domestic electrical appliances, "in the chair."

The Electrical Research Association.—The report of the Council of the British Electrical and Allied Industries Research Association for the year ended September 30th, 1925, to be submitted to the annual general meeting to-day, contains a foreword by Mr. Ll. B. Atkinson, chairman of Council, pointing out that the five years' agreement between the Department of Scientific and Industrial Research and the Association ended with the period under review; he expresses gratification at the satisfactory results achieved in that time, seeing that the organisation had to be built up. In future the grants from the Department will progressively diminish, and contributions to the funds must be sought from other sources.

The report states that the Department appointed a committee of investigation, whose report expressed high appreciation of the work of the Association. Subscriptions and grants have been promised, sufficient to cover the minimum requirements of the Association for a further five years.

Researches are in progress in connection with dielectrics in general, and a comprehensive programme of fundamental research into the properties of insulating materials has been under consideration, but at present the funds are not sufficient to permit of its being put in hand. Proposed purchasing specifications have been issued for pressboard, cotton fabric, and shellac; investigations on synthetic resins and hard composite dielectrics have been completed; and researches have been carried out on insulating oils, porcelain, mica and micanite, buried cables, and poles for overhead lines. It is stated that a heavy testing set built specially for testing switchgear could be kept continuously employed, and that new results would in all probability be obtained. Researches on switchgear and fusible cut-outs, steam condensers, and steam turbines have been continued, and it is estimated that the nozzles research has enabled a saving of 3 per cent. in the steam consumption of large turbines to be made. Extended steam tables have been prepared. Confidential researches on transformer steel and phosphor-bronze springs have been put in hand, and the question of telephone interference has been studied. Many reports, some of which are confidential, have been issued.

A folding diagram illustrates the organisation of the Association and its numerous sections and sub-committees, and the personnel of the latter, as well as lists of members and associate members of the Association, is appended to the Report.

Educational.—Faraday House Scholarships.—The annual examinations for a Faraday scholarship of fifty guineas per annum (tenable for two years in college and one year in manufacturing works) and for a Maxwell scholarship of fifty guineas per annum (tenable for one year in college and one year in works) will be held at Faraday House, on April 7th, 8th, and 9th, 1926. Exhibitions may also be awarded to candidates who acquit themselves creditably in the above examinations, but do not obtain the necessary number of marks to qualify for a scholarship. Further particulars may be obtained from the Secretary, Faraday House, 62-70, Southampton Row, London, W.C.1.

Difficulties in Interviewing.—The following is a copy of a letter received by an electricity supply undertaking:—

"I called to-night the second time to make inquiries in reference to having electric light laid on in my flat in this house. Never in any place have I met a man less able or less willing to give the required information. He reeled off whole paragraphs about volts and units and divisions of thousands by forties, all of which is quite incomprehensible to any person knowing nothing about the measurements of electricity; and I venture to say that such people are the greatest majority by far. What I wanted to know, and still want to know is how the price of electricity compares with gas. When I asked that question, I was told most off-handedly, "he thought it would be cheaper." I then said I could not act on thought, and told him what the average cost of my gas is, hoping he might be able to make some comparison. All the reply I received was "you had better stick to your gas." However, I still tried to get information, but came away about as well informed as before I called. With me, as with most people, the question is "will electricity laid on by the company work out at about the same cost as gas, or will it be more expensive?" We do not need to be told it is cleaner and a greater comfort. We know that, but the comfort most people can have is regulated by their purses. Surely the company could make comparable tables that would be intelligible to the ordinary person. I have no doubt that had I been an attractive young lady I should have been most graciously given the information I required by the young man; but as the management of most houses is in the hands of women not quite young, it may be worth the company's while to have an attendant especially for elderly and stupid (!) women."

[If, as the writer of the letter says, the supply assistant reeled off whole paragraphs about volts, &c., it does not bear out the lady's impression that he was unwilling to impart information: but it does suggest that the use of technical terms may have irritated her. All prospective consumers cannot, of course, be treated alike, and the writer of the letter may prove to be one of those cases where the strict avoidance of technical terms and a generous supply of tact will produce the desired results.]

Ex-British Westinghouse Association.—An invitation has been "broadcast" to members of this Association to attend the dinner on Friday, March 5th, at the Holborn Restaurant, London. Tickets may be obtained from Mr. W. E. Warrilow, 40, Mildred Avenue, Watford, Herts.

Telephone Exchange Model.—A demonstration set, comprising a working model of the outgoing and incoming sections of a telephone exchange, has been completed by the London telephone authorities, and arrangements are in hand for a course of lectures to literary and other societies in London which may be interested in the subject. Applications from such societies for particulars of the lectures will be welcomed. The adoption of the correct methods of operating by subscribers is important, and arrangements have been made for many visits to exchanges, both in the case of individual subscribers and of parties, the latter including parties from engineering colleges, public schools, L.C.C. evening institutes, borough council municipal colleges, members of local Chambers of Commerce, representatives of overseas telephone corporations, City of London institutes, clubs, workers' educational associations, and students from abroad. A correct view, on the part of subscribers, of the general working of the system is very important, and there is abundant testimony as to the value of such visits of exchanges. The London Telephone Service welcomes personal examination by any subscriber of the organisation and working of the exchange which serves him, or of any other exchange he desires to see.

National Association of Supervising Electricians.—The annual meeting of members of the National Association of Supervising Electricians was held on February 2nd at the Junior Institution of Engineers, 39, Victoria Street, London, S.W.1, and was attended by a large audience. Mr. W. J. Revell, the chairman of the Association, in his address, referred to the growth of the Association financially and numerically, and emphasised the important position it now occupied in the electrical industry, which was the result of the general policy of the Association with regard to admittance of only qualified men, and its outlook on industrial matters. The educational activities for the past 12 months had increased, and included lectures, debating society meetings, works visits, the W. E. Highfield Shield, the "Economic Premium" Competition, and the N.A.S.E. Scholarship scheme. In referring to the Employment Bureau, Mr. Revell said that it was gratifying to know that positions ranging from £300 to £500 per year had been secured for a number of the members, the success in this direction being in advance of previous achievements. It was becoming recognised that membership of the Association was, generally speaking, a qualification. The chairman also made reference to the fact that the N.A.S.E. continued to be represented on the I.E.E. Wiring Rules and B.E.S.A. Committees. He referred to the regrettable resignation of Mr. Frank Gill, M.Inst.C.E., M.I.E.E., the president of the Association, owing to business abroad, and said they had been fortunate in securing Mr. A. M. Sillar, M.Inst.C.E., M.I.E.E., M.I.Mech.E., as the new president of the Association, and he appealed to the membership to give Mr. Sillar their loyal support.

The following were elected to fill the five vacancies on the Board of Control according to rule:—Messrs. C. Bull, J. Cowan, E. L. Eastell, B. C. Garman, and F. W. Smith. Messrs. F. E. Phillips and B. S. Westaway were elected auditors.

Electricity as a Public Utility.—Col. Oakley (chairman of the Basingstoke Corporation Electricity Committee) presided at a meeting held in the Town Hall on January 27th, when an address, with lantern illustrations, was given by Mr. J. W. Beauchamp, secretary of the British Electrical Development Association, on "Electricity as a Public Utility." In the course of his remarks, Mr. Beauchamp mentioned that there were about 25,000 electric ranges in use in this country.

Fatality.—On February 8th, two Post Office electrical engineers, A. W. White and W. F. G. Merritt, received fatal injuries owing to the collapse of a telephone standard on which they were working, falling from the top of a five-storey building on to the "live" line of the Metropolitan Railway at Farringdon Street Station. White was killed by electric shock, and Merritt died from his injuries in St. Bartholomew's Hospital.

International Electrotechnical Commission.—Arrangements for the meetings of the I.E.C., which are to commence in New York on April 13th next, are now completed. The technical sessions will commence on April 13th and continue until the 16th, when there will be a break of two days; they will recommence on the 19th, and, it is hoped, conclude on the 22nd. Since The Hague meeting the various National Committees have been considering the proposals that emanated from that meeting. A number of experts' papers on the important question of the rating of electrical machines are to be presented, and probably apart from that question one of the most important subjects to be discussed will be the rating of hydraulic and steam turbines for electrical plant. Other subjects include transformer oils, traction motors, &c., details of which will receive attention at New York.

At the conclusion of the technical meetings, the United States and Canadian Committees (hosts of the International Commission) are providing free transportation and sleeping-car accommodation for a tour of some 2,500 miles that will include visits to: Washington, Philadelphia, Baltimore, Pittsburgh, Chicago, Detroit, Niagara Falls (two days), Toronto, Montreal, and Schenectady. At Niagara the Canadian Committee will take over the party and visit Toronto and Montreal. The United States Committee will then take the party to Schenectady and back to New York, the tour terminating on May 8th.

The delegates from Europe are to travel in the Cunard s.s. *Andania*, sailing from Hamburg on March 31st, and Southampton and Cherbourg on April 2nd, and it is evident that this meeting in New York will be well attended. It is the first time that a plenary meeting of the I.E.C. has been held in America, although the St. Louis Exposition of 1904 was practically the birthplace of the Commission. The National Committees are adding to their working delegates a number of influential representatives to do honour to the occasion.

Institution Notes.

Institution of Electrical Engineers.—SCOTTISH CENTRE.—The Scottish Centre of the Institution, whose headquarters are in Glasgow, is to celebrate its semi-jubilee with a ladies' evening on the 17th inst. The function will take the form of a dinner, followed by whist and dancing. Prof. Magnus Maclean, chairman of the Centre, will be in the chair.

Physical Society of London.—CHANGE OF ADDRESS.—The registered office of the Society has been moved to 30, Great Russell Street, London, W.C.1.

Society of Engineers.—The report of the Council for the year 1925 shows that the membership has increased by 41 to 611, and there are 10 associated societies. The president for 1926 is Mr. G. O. Case.

Incorporated Municipal Electrical Association.—SUMMER MEETING.—In connection with the visit to Glasgow in June next of the Association for its annual conference, a request for the use of the banqueting hall at the Municipal Buildings for a reception has been granted. The Electricity Committee is to entertain the visitors.

Institute of Transport.—It is announced that the paper on "State Ownership of Waterways," to be read before the above Institute at the Institution of Electrical Engineers, on Monday, March 1st, will be delivered by Mr. H. D. Dickinson of the University, Leeds, instead of by Prof. J. H. Jones, M.A., as previously stated.

Junior Institution of Engineers.—A question and discussion evening was held on February 5th, and was very successful. Questions on the following subjects, amongst others, were raised, and in every case an answer was forthcoming:—Pressure gauges for the air supply to boilers; interference between wireless receivers in restricted areas; the testing of rotors for dynamic balance; and the prevention of rust in workshops in mild and moist weather.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Watford Urban Council has decided to award the sum of £500 to the borough electrical engineer, Mr. BARHAM, in recognition of the special technical work involved in the erection of the new power station, and the changing-over from single-phase to 3-phase. Sums of £75 each have also been granted to Messrs. GREENHALGH and WALLEY in recognition of special assistance given to the engineer.

Mr. L. G. SIMS, M.Sc., has been appointed by the Council of the University of Birmingham lecturer in electrical engineering, vice Mr. O. R. Randall, Ph.D., M.Sc., B.Sc. (Lond.), who has been appointed professor of electrotechnics at the Witwatersrand University, Johannesburg.

Mr. REDMAN, the electrical engineer of Shipley, has been seriously ill, and is still confined to his house. The Electricity Committee has expressed its best wishes for his speedy and complete recovery.

BAILIE HIGGINS, the sub-convener of the Glasgow Corporation Electricity Committee, has been elected for a further period of three years as Clyde organiser of the Electrical Trades Union, a post he has held for the last six years.

Southport Corporation is recommended to increase the salary of Mr. A. LATHOM, mains assistant, to £273 12s. per annum.

The marriage took place at St. Mary's Church, Bearwood, Birmingham, on January 23rd, of Mr. CECIL A. KERSHAW, of the London staff of Messrs. Merz & McLellan, consulting electrical engineers, and Miss DORIS ROBERTS, of Talbot Road, Bearwood.

The Bradford Corporation last week referred back to the Estimates Sub-Committee for further consideration a series of proposed salary increases, including that of Mr. THOS. ROLES, city electrical engineer, whose present salary is £1,500, and the increase recommended was £100 per annum to the maximum salary at present provided for the position.

Obituary.—ALD. E. PRIESTLEY.—The chairman of the Bradford Tramways Committee, Alderman Enoch Priestley, was killed on the L. & N.E. Railway on February 2nd. He was 71 years of age. At an inquest a verdict of "Accidental death" was returned.

MR. T. W. WARD.—We regret to record that Mr. T. W. Ward, a founder of the firm of T. W. Ward, Ltd., iron, steel, and machinery merchants, of Sheffield, passed away recently at the age of 72 years. Mr. Joseph Ward, brother, has been managing director of the company for some time past, but Mr. T. W. Ward was a director up to the time of his death.

MR. J. C. B. INGLEBY.—The death is reported of Mr. J. C. B. Ingleby, managing director of the Electric Motor and Stove Hiring Co., Leeds.

MR. A. E. GIFFEN.—Mr. Alexander Ewing Giffen, chief of the Post Office Engineering Department in the North Staffordshire and South Cheshire area, died last week at the age of 55.

MR. J. V. MOINET.—The death has taken place at Hamilton of Mr. J. V. Moinet, burgh electrical engineer and manager. Mr. Moinet, who had been Messrs. Edmundson's resident engineer and manager, accepted the invitation of the Town Council to continue as official in charge when the works were taken over at the beginning of this year. Mr. Moinet was at Scarborough before going to Hamilton.

SIR T. BROOKE-HITCHING.—Sir Thomas Henry Brooke-Hitching, who died last week, was, *inter alia*, a director of the Chiswick Electric Supply Corporation, Ltd., and the West London and Provincial Electric Supply Co., Ltd.

Wills.—The late Mr. EDWARD D. M. SCRIVENER, managing director of Taylor, Tunnicliff & Co., Ltd., left £39,529 (£28,049 net personalty).

The late Mr. L. W. SPRATT, a director of the Hart Accumulator Co., Ltd., left £151,988 gross and £147,466 net personalty.

New Companies Registered.

Daycomar, Ltd. (211,492).—Private company. Registered February 3rd. Capital, £200 in £1 shares. Objects: To carry on the business of agents and concessionaires for foreign and domestic electrical, radio and optical goods, manufacturers of and dealers in all kinds of kinematograph, phonographic, musical, electrical, mechanical and optical goods, &c. The directors are:—J. S. Martin, 33, Kensington Square, W.8; W. E. L. Day, Hollydene, 15, Cholmeley Park, Highgate, N.6. Solicitors: Kerly, Sons and Karuth, 10-11, Austin Friars, E.C.2. Registered office: 19, Lisle Street, W.C.2.

W. T. Hellaby & Co., Ltd. (211,557).—Private company. Registered February 5th. Capital, £2,000 in £1 shares. Objects: To acquire various business assets and effects from B. French and W. T. Hellaby, and to carry on the business of electricians and electrical contractors, electrical, mechanical, gas, water, heating, lighting, motor and general engineers, &c. The directors are:—B. French, Summer Bank, Bewdley Hill, Kidderminster; W. T. Hellaby, Trevine, Water Orton, Warwickshire. Qualification, 1 share. Solicitor: H. G. Ivens, High Street, Kidderminster. Registered office: 80, Dale End, Birmingham.

Economisers Engineers, Ltd. (211,393).—Private company. Registered January 29th. Capital, £500 in £1 shares. Objects: To carry on the business of electrical and mechanical engineers, boiler makers, brassfounders, ironfounders, tin and copper smiths, &c. The directors are:—G. Austin, 31, Ashton Road, Golborne, near Warrington; G. Coombes, 7, Granville Avenue, Whalley Range, Manchester; H. Ward, 7, Granville Avenue, Whalley Range, Manchester; S. A. Ward, 7, Granville Avenue, Whalley Range, Manchester. Qualification, £1. Solicitor: R. Barrow-Sicree, 86, Cross Street, Manchester. Registered office: 5, Blackfriars Street, Deansgate, Manchester.

T. B. T. Electric Co., Ltd. (211,407).—Private company. Registered January 29th. Capital, £2,000 in £5 shares. Objects: To carry on the business of electrical and mechanical engineers, suppliers, and contractors and manufacturers, exporters, importers and workers of and dealers in electrical, magnetic, galvanic and mechanical machines, &c. The subscribers (each with one share) are:—T. B. Thrige, Odense, Denmark, manufacturer; L. C. Peter, Ornberg, Odense, Denmark, director. T. B. Thrige is permanent governing director. Solicitors: Turner & McCandlish, 3, Raymond Buildings, Gray's Inn, W.C. Registered office: 171, Queen Victoria Street, E.C.4.

Frank Thornton, Ltd. (211,479).—Private company. Registered February 3rd. Capital, £6,000 in 2,250 7½ per cent. cumulative preference and 3,750 ordinary shares of £1 each. Objects: To carry on the business of manufacturers of and dealers in instruments, apparatus, accessories and all materials connected with radio, telegraphy, telephony, and television, and in particular cables, wires, ropes or other substances, accumulators, batteries, &c. The permanent directors are:—Mrs. M. Thornton, address not stated; F. H. Thornton, 167, Rosehill Road, Burnley; H. Thornton, 29, Hogarth Avenue, Burnley; W. H. Thornton, address not stated. Qualification, 150 ordinary shares.

Avalite, Ltd. (211,476).—Private company. Registered February 3rd. Capital, £6,000 in 2,250 7½ per cent. cumulative preference and 3,750 ordinary shares of £1 each. Objects, directors, and all other particulars as Frank Thornton, Ltd., above.

Electric Super Service Co., Ltd. (211,461).—Private company. Registered February 2nd. Capital, £1,000 in £1 shares. Objects: To carry on the business of electricians, electrical and mechanical engineers and contractors, &c. The permanent directors are:—Mrs. E. M. Chalmers, 6, St. John's Wood Road, N.W.8; J. W. P. Chalmers, 6, St. John's Wood Road, N.W.8, consulting engineer. Qualification, £100. Registered office: 30, College Street, Dowgate Hill, E.C.4.

Wood, Russell & Co., Ltd. (211,474).—Private company. Registered February 2nd. Capital, £7,000 in £1 shares. Objects: To acquire the business now carried on at 34 and 36, Oxford Street, W., as "Wood, Russell & Co.," and to carry on the business of mechanical, electrical, gas and motor engineers, metal workers, ironfounders, builders, tool makers, water supply engineers, &c. The directors are:—P. N. Wood, Netherheys, South Croydon, boiler manufacturer; and G. D. Russell, Upmeads, Guildford, engineer (both permanent, subject to each holding 2,000 shares). Remuneration of permanent directors, £250 each per annum; of ordinary directors as fixed by the company. Solicitors: Guscotte, Fowler & Cox, 1, York Buildings, Adelphi, W.C.2.

Angel Super Signs (1926), Ltd. (211,508).—Private company. Registered February 4th. Capital, £5,000 in 4,950 ordinary shares of £1 each and 2,000 management shares of 6d. each. Objects: To acquire the business of general sign manufacturers, &c., heretofore carried on by Angel Super Signs, Ltd., and to carry on the business of designers, inventors and manufacturers of and dealers in all kinds of signs, &c. The subscribers (each with one ordinary share) are:—S. H. Cotton, 76, Meath Road, Ilford, Essex, clerk; G. Goodwin, 94, Barry Road, East Dulwich, S.E.22, clerk. The first directors are to be appointed by the subscribers. Qualification, 100 shares of either class. Solicitors: Arthur Hunt & Money, 24, Haymarket, S.W.1.

Official Returns of Electrical Companies.

Ajax Production Engineers, Ltd.—A. G. White, C.A., 14, Old Jewry Chambers, E.C., was appointed receiver on January 28th, 1926, under powers contained in debentures dated January 11th, 1924.

B. M. A. S., Ltd.—J. Collier, I.A., King Street West, Manchester, was appointed receiver and manager on January 29th, 1926, under powers contained in debenture dated February 12th, 1925.

Pressland Electric Supplies, Ltd.—F. W. Stephens, of Salisbury House, London Wall, E.C., was appointed receiver and manager by Order of Court dated January 29th, 1926.

Simms Motor Units (1920), Ltd.—Issue on January 8th, 1926, of £5,000 debentures, part of a series already registered.

C. F. Palmer (London), Ltd.—Charge pursuant to Land Registration Act, 1925, to secure £3,000 charged on 63a, Effra Road, Brixton, S.W., and land adjoining. Holder: C. F. Palmer, 91, Holmdene Road, Herne Hill, S.E.24.

Wallingford and District Electric Supply Co., Ltd.—Debenture dated January 23rd, 1926, to secure £3,500, with further advances up to £4,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: F. J. Kirby, "Riverside," Donnington, near Newbury, Berks.

Hawk Coil Co., Ltd.—Debenture dated January 26th, 1926, to secure £343, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: R. J. Coley, 189, Richmond Road, Kingston-on-Thames.

Specialities (Liverpool), Ltd.—Satisfaction in full on October 29th, 1925, of debenture dated September 28th, 1922, securing £500. (Notice filed January 29th, 1926.)

Woking Electric Supply Co., Ltd.—Satisfaction to the extent of £500 on February 20th, 1915, of debenture stock issued under trust deed dated March 1st, 1926, securing an indefinite amount.

Hewittic Electric Co., Ltd. (89,947).—Capital, £50,000 in £1 shares. Return dated November 18th, 1925. 40,000 shares taken up. £40,000 paid. Mortgages and charges, nil.

East Lancashire Electric Co. (Accrington), Ltd. (140,029). Capital, £3,000 in £1 shares. Return dated August 19th, 1925 (filed February 2nd, 1926). 1,475 shares taken up. £1,325 paid. £150 considered as paid. Mortgages and charges, nil.

Ferryside Electric Supply Co., Ltd. (186,406).—Capital, £1,200 in £1 shares. Return dated January 14th, 1926. 1,000 shares taken up. £1,000 paid. Mortgages and charges, nil.

Western Telegraph Co., Ltd. (6,886C). — Capital, £3,500,000 in £10 shares. Return dated December 10th, 1925. 311,895 shares taken up. £2,339,650 paid. £779,300 considered as paid. Mortgages and charges, £818,675.

Delagoa Bay Development Corporation, Ltd. (76,099).—Capital, £166,300 in 267,400 ordinary shares of 10s. each and 130,400 preference shares of 5s. each. Return dated December 25th, 1925. 267,400 ordinary and 68,400 preference shares taken up. £105,800 paid. £45,000 considered as paid. Mortgages and charges, £245,550.

C. H. Hare & Son, Ltd. (110,911).—Capital, £20,000 in 9,000 ordinary and 11,000 preference shares of £1 each. Return dated December 31st, 1925. 8,600 ordinary and 11,000 preference shares taken up. £12,102 paid on 11,000 preference and 1,102 ordinary shares. £7,498 considered as paid on 7,498 ordinary shares. Mortgages and charges, nil.

Liverpool Electric Cable Co., Ltd. (71,099).—Capital, £30,000 in £1 shares. Return dated December 30th, 1925. All shares taken up. £7,833 paid. £22,167 considered as paid. Mortgages and charges £24,795.

Mawdsley's, Ltd. (91,783).—Capital, £20,000 in £1 shares. Return dated January 4th, 1926. 18,937 shares taken up. £6,937 paid. £12,000 considered as paid. Mortgages and charges, £6,300.

City of Freetown (Sierra Leone) Electricity Co., Ltd. (138,058).—Capital, £15,000 in £5 shares. Return dated December 31st, 1925. 200 shares taken up. £1,000 paid. Mortgages and charges, nil.

East India Tramways Co., Ltd. (74,457).—Capital, £125,000 in 15,000 preferred, 35,000 ordinary, and 75,000 deferred shares of £1 each. Return dated December 9th, 1925. 7,476 preference, 33,433 ordinary and 75,000 deferred shares taken up. £7,489 paid on 7,476 preference and 7 ordinary shares (including £6 paid on 24 preference shares forfeited). £108,426 considered as paid on 33,426 ordinary and 75,000 deferred shares. Mortgages and charges, nil.

Concordia Electric Wire Co., Ltd. (74,416).—Capital, £100,000 in £1 shares. Return dated November 25th, 1925. 57,319 shares taken up. £57,319 paid. Mortgages and charges, £34,500.

Trent Electric Wire Works, Ltd.—Debenture dated January 23rd, 1926, to secure £1,000, charged on the company's undertaking and property, present and future. Holder: A. M. Gourlay, 24, George Square, Glasgow.

Drake & Gorham, Ltd. (70,275).—Capital, £125,000 in £1 shares. Return dated November 12th, 1925. All shares taken up. £85,000 paid. £40,000 considered as paid. Mortgages and charges, £12,000.

Liskeard Gas and Electricity Co., Ltd.—Particulars filed of £8,000 debentures authorised October 28th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £4,400 (on January 21st, 1926).

Van Raden & Co., Ltd. (78,383).—Capital, £10,000 in £1 shares. Return dated November 30th, 1925. 6,754 shares taken up. £4,654 paid. £2,100 considered as paid. Mortgages and Charges: Mortgage, £1,800 debenture, £1,200; loan, £3,200.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Yorkshire Electric Power Co.

The accounts for 1925 show a net profit after meeting interest and debenture charges, of £205,016, as compared with £182,764 in 1924. A balance of £46,053 is brought forward, making £251,065, and it is proposed to allocate this amount as follows: Dividend of 6 per cent. (3 per cent. already paid) on the cumulative preference shares £39,529; dividend of 8 per cent. (3 per cent. already paid on the ordinary shares, £84,667; to general reserve fund £40,000; to plant renewals fund, £25,000; writing off expenses of inquiries under the Electricity (Supply) Acts, &c. £6,819; carried forward, £55,051. The report states that the revenue has been maintained in spite of the general trade depression. Substantial economies have been effected, and the prices to consumers have been reduced. The supply of electricity in bulk continues to increase, there having been a number of agreements for new and additional supplies during the year. The addition of the Shipley Urban District Council to the company's system brings the number of distributing undertakings to 57. Following upon the abandonment of the West Riding (Aire and Calder) Electricity District scheme the company has proceeded with its development in the north-western districts; extensions have been made and the existing network is being reinforced by a system of 33,000-V mains; the first section, between Thornhill and Halifax, has been completed. A second 12,500-kW turbo alternator has been installed at the Thornhill station and a portion of the generating plant has already been installed at the Ferrybridge Station. It is expected that the initial installation of 50,000 h.p. will be completed during the current year. In February last year an issue was made of 500,000 ordinary shares of £1 each. To meet the rapid growth of the company's operations the directors recommend that 765,000

six per cent. cumulative preference shares be offered to shareholders forthwith at 21s. each. An extraordinary meeting is to follow the general meeting (at Leeds, February 16th), at which a resolution will be submitted providing for the issue of a further £794,000 as ordinary or preference capital, being the balance of the £4,000,000 authorised by the company's Acts. The shareholders will also be asked in due course to consent to the promotion of a Bill to increase the authorised capital to £6,000,000. The directors propose to give £5,000 to the Leeds University Building Fund by annual payments over a period of years.

Ferguson, Pailin, Ltd. The annual meeting was held on February 4th. Sir Kenneth Crossley (chairman), who presided, said that satisfactory progress had been made during the past year. The dividend remained at the same level, but the reserve had been increased by £10,000, and the value of goodwill and patents had been written down to £1. It was difficult to make a forecast of the company's prospects. The electrical industry was undoubtedly the brightest spot in the home industrial situation, and the Government's electricity scheme (which, he thought, would not cheapen electricity) should bring benefits to the general trading community. They could confidently expect a share in the large amount of orders which would eventually be placed. The extension of the company's Buckley Street works was proceeding satisfactorily, and the factory of the Australian company (which also reported progress) had been extended too.

Siemens Bros. and Co., Ltd. At an extraordinary meeting, held on February 5th, under the chairmanship of Mr. G. Mure Ritchie, a resolution was passed limiting the number of 10 per cent. cumulative preference shares to the number already issued (550 000), and providing for the conversion of the balance (450.000) of these shares into ordinary shares, leaving 950,000 ordinary shares unissued. The chairman explained that fresh capital was needed to finance the increased amount of business which the company was securing, and hoped to secure in the near future. It was proposed to issue 500.000 ordinary shares of £1 each forthwith, and these would be offered exclusively to shareholders in the proportion of one new share to each three held. The shares would be issued at 23s.; they would not participate in the dividend for the past year.

Traction and Power Securities Co., Ltd. The annual meeting of this company was held last week, Mr. H. A. Vernet (chairman) presiding. In presenting the report and accounts, the chairman said that the issued share capital remained at £683,280, while the debenture stock had increased from £300,000 to £365,036. The value of investments at or under cost had risen from £1,062,905 to £1,307,633, and the reserve stood at £200,000 as compared with £166,259 at the end of the preceding year. After referring to the increased net revenue and the raising of the dividend from 10 to 13 per cent., the chairman said that the return to the gold standard had eliminated the baneful uncertainty from sterling exchange. The way was now clear for the remodelling of our internal currency system.

Joseph Lucas, Ltd. At an extraordinary general meeting on February 4th a resolution was approved providing for the raising of the company's capital to £1,100,000 by the creation of 300,000 new shares of £1 each. The chairman, Ald. H. J. Sayer, explained that the new capital was needed in connection with the acquisition of the control of C. A. Vandervell and Co., Ltd., and Rotax (Motor Accessories), Ltd. It was proposed to allot 130,000 of the new shares for the whole of the ordinary shares of Rotax, Ltd. Then 126,500 shares would be issued immediately to the company's own shareholders in the proportion of one new share to each five held at the rate of 65s. per share. The company's principal aim was to standardise automobile electrical equipment as far as possible and improve the "after-sale" service.

Fellows Magneto Co., Ltd. The directors state that for several reasons they are unable to submit completed accounts for the past year. It has been found that while the radio apparatus branch has been making substantial profit, the magneto branch has been working at a loss. There appears to be no prospect of improvement in the latter part of the business and it has been decided to cease manufacturing magnetos and to concentrate upon the production of radio apparatus. A scheme of reconstruction is under consideration. The directors therefore asked the shareholders to adjourn the meeting which was to be held on February 8th until the proposals were ready.

Westinghouse Brake and Saxby Signal Co., Ltd.—The annual meeting was held on February 5th. Lord Southborough, who presided, referred to the many developments which the company had made to meet requirements as they arose, and said that in spite of the depression in the coal industry, many collieries had replaced their old methods of handling coal at the pit decks by the company's electro-pneumatic system. To enable them to furnish additional capital to their Continental associated companies, it was proposed to issue £100,000 of new capital. There would be no difficulty in this as the shareholders had offered to take the whole of the shares.

Oliver Pell Control, Ltd.—A public statement was made in the financial Press last week to comply with Stock Exchange regulations. It stated that the authorised capital is £100,000 in £25,000 eight per cent. cumulative participating shares and 75,000 ordinary shares of £1 each. The former class is entitled to a further participation in profits when the ordinary shares have received 8 per cent., and after receiving 12 per cent. for not fewer than three consecutive years, may be converted into ordinary shares. A dividend of 10 per cent. was paid on both classes of shares in respect of 1924.

Uxbridge and District Electric Supply Co., Ltd.—The accounts for the year ended December 31st last, which are to be presented at the annual meeting on Wednesday next, show a profit of £39,745 and to this is added £1,590 brought forward, making £41,335. Debenture interest, &c., and depreciation absorb £19,950, and it is proposed to pay a dividend of 8 per cent. on the ordinary shares, and to carry forward a balance of £1,385.

City of Buenos Aires Tramways Co. (1904), Ltd.—The balance of net revenue for the year ended December 31st last is £80,838. A final dividend of 1s. 3d. per share (making 5s. for the year) is recommended; £5,604 is to be transferred to the amortisation and general fund, and £13,234 is to be carried forward.

Power Securities Corporation, Ltd.—The report for the past year shows a gross income of £96,412 and an available balance of £77,966. The addition of £8,556 brought forward makes a total of £86,522. It is proposed to transfer £20,000 to reserve, to pay a dividend at the rate of 6½ per cent. on the ordinary shares, and to carry forward £12,944. Meeting: February 17th.

Enfield Cable Works, Ltd.—The directors have decided to offer the balance of the unissued ordinary capital to existing ordinary shareholders in the proportion of one new share, at 45s. per share, for each five ordinary shares at present held. The new shares will rank *pari passu* with the existing ordinary shares for future dividends.

Ever-Ready Co. (Great Britain), Ltd.—At a meeting to be held on March 1st the directors will submit a scheme for the capitalisation of £49,800 of the general reserve, and the issue of £1 ordinary shares to the shareholders in the proportion of one to each five shares held.

Dorman, Long & Co., Ltd.—As briefly reported in our last issue, an offer of £500,000 of 5½ per cent. redeemable first mortgage debenture stock was made last week at the rate of 93½ per cent. The stock is redeemable at par on or before May 1st, 1963, or it may be redeemed at 102 per cent. on or before May 1st, 1943, at three months' notice.

Shropshire, Worcestershire, and Staffordshire Electric Power Co.—A meeting is to be held to-day (Friday) to consider resolutions for the issue of 50,000 existing £1 shares as 6 per cent. preference shares, and of 10,685 "A" ordinary and 42,137 "B" ordinary shares of £1 each.

Tottenham District Light, Heat, and Power Co.—The directors recommend the following dividends for the half-year ended December 31st last:—Preference stocks: at the rate of 5½ and 5 per cent. respectively; "A" stock: at the rate of 7⅜ per cent.; "B" stock: at the rate of 5⅞ per cent.

Isle of Thanet Electric Supply Co., Ltd.—The ordinary shares are to receive a dividend of 2½ per cent., the first to be paid. The company proposes to issue 72,000 six per cent. participating preference shares at par to existing shareholders in the proportion of one to five.

London Electric Supply Corporation, Ltd.—The directors have declared the balance of the dividend on the 6 per cent. preference shares for 1925, and a final dividend at the rate of 12 per cent. upon the ordinary shares (less tax) making 10 per cent. for the year.

St. James' & Pall Mall Electric Light Co., Ltd.—A balance dividend of 7s. 6d. per share and a bonus of 5s. are recommended on the ordinary shares, making a total distribution of 17½ per cent. for the year, as in 1924.

Stock Exchange Notice.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Hendon Electric Supply Co., Ltd.—22,212 ordinary shares of £1 each, fully paid, Nos. 73,884 to 96,095.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—The directors recommend the payment of a final dividend of 2½ per cent. on the ordinary shares.

National Gas Engine Co., Ltd.—A dividend of 4 per cent. has been declared on the ordinary shares for the past year.

Stocks and Shares.

MONDAY EVENING.

BUSINESS in the Stock Exchange is proceeding very quietly. Members and clients are alike becoming restive under the enforced restfulness that stands in such marked contrast to the feverish activity which prevailed up to the end of last year. The rending of the rubber boom has cost many people money, and the stream of new issues tends to divert attention from older stocks and shares. The Stock Exchange is, in a word, quiescent. It demands a detached mind to acknowledge the

logic of the present position as being only what might have been expected after nine months of active and excited markets. Cable equipment issues have parted with some of their recent exuberance, though prices are well maintained, and the declines are modest as compared with the previous substantial rises in a good many prices.

The London Electric Supply Corporation announces a final dividend for 1925, making 10 per cent. for the year, the same as that of the previous twelve months. The price of the shares remains at 32s., to which it fell last week, and the return on the money invested in the shares at to-day's price is 6¼ per cent. Chelseas are dull at 2⅛. Urban ordinary went back to 19s. 6d. There is a good deal of quiet buying of Whitehall Electric Investment 7½ per cent. preference, which shares can still be obtained at their par price of 20s. The chairman of the Gas Light & Coke Company protested, at the recent meeting, that the Government is unduly favouring electricity; he referred more particularly, of course, to the electrical expansion scheme which is now proposed. No doubt the provision of fresh capital for development of the scheme would be assisted by the extension of the Trade Facilities Act to the financing part of the plan.

Underground Electric Railways of London are a good spot. The £10 shares have risen to 2½ and the income bonds are close to 100. The Underground group declares its dividends on the Thursday in this week. Districts, however, are ½ lower at 47½. Speculation is taking mild interest in some of the London tramway issues. London and Suburban preference are up 1s. to 4s. 6d. London United Tramways 4 per cent. debenture gained 4½ points at 45, and the Company's ordinary shares strengthened to 3s. The market in these has been dormant for so long a time that curiosity is expressed as to what may be the possible reason for this revival of attention. The recent report upon the results of the L.C.C. Tramways was not such as to encourage optimism, and this consideration adds to the interest attached to the rises in tramway shares.

The dispute, over wages, between the Underground Railways and the Electrical Trades Union has had no effect so far upon prices of stocks and shares in companies that might be affected if the trouble should become serious.

Metropolitan-Vickers ordinary have dropped back to 28s., but General Electrics gained a trifle, to 31s. 6d., upon the formation of the Siemens & General Electric Railway Signal Company. Both companies have carried on separate railway signalling departments, but these branches are now to be amalgamated into the new undertaking. Details of the latter are expected to be made public very shortly. The Yorkshire Electric Power Company is about to offer 765,000 6 per cent. cumulative preference shares of £1 each, the issue price of which will be a guinea. The company's profits for last year came out at £205,000, an advance of £22,000 over those of 1924, and the dividend on the ordinary shares is maintained at 8 per cent. upon the larger capital. The existing 6 per cent. preference stand at 22s. 6d. in the market, this price carrying the dividend of 7 1/5d. per share. The ordinary, at 31s., yield £5 3s. per cent. on the money.

Another company which is raising new capital is the Enfield Cable Works, in which proprietors of the existing ordinary shares are to be offered one new share at 45s. for every five shares at present held. As the latter stand about 69s. ex dividend, the new issue offers a pleasant bonus. It may be pointed out that shareholders, whether they care to take up their allotments or not, should on no account miss the opportunity of securing the benefit which this new issue affords them, for the rights will be readily saleable in the Stock Exchange. Many people throw away papers that invite them to subscribe more capital, and by so doing they present "money for nothing" to those who are only too glad of the chance to take up new shares, offered at bonus prices, which are not subscribed by the original allottees.

The Isle of Thanet Electric Supply Company proposes to issue 72,000 participating 6 per cent. preference shares at par to all shareholders; one new share being offered in respect of every five old shares held. The Company has declared its first dividend on the ordinary shares, and at the rate of 2½ per cent. actual. The price of the latter is 17s. middle. The new preference will participate with the ordinary after the latter shall have received 6 per cent. dividend.

The Brazilian Traction boom continued further, the price being run up, on American-Canadian buying, to 98. Around this figure a lot of shares came in, and reaction carried back the quotation to 94½ ex dividend, at which there was still left a rise of 3½ points on the week. Mexican Light & Power Common and preferred are better, upon some vague, and quite improbable, rumour of early dividend-resumption on the former. Yorkshire (West Riding) Trams have gone back to 17s. 6d. Cable and telephone descriptions are uninteresting. Automatic Telephones at 2⅝ have lost 1/16; so have Orientals at 2⅛. The wireless shares are neglected because of the uncertainty felt as to what may be the outcome of the conferences between the Government and the wireless operators in connection with the strike of the latter.

India Rubber shares are up to 25s. Telegraph Constructions put on a further 10s. at 28½. The other changes in this group have been already mentioned. Rubber shares have retreated well into the background of popular favour. Business in them runs on humdrum and unexciting lines, the price of the produce, at 2s. 10d. per lb., being 1s. 10d. below the highest level reached during the boom period before Christmas.

The Interconnection of Power Systems.

The Successful "Loose-linking" of Large Power Stations in America.

In view of the Government's proposed method of reorganising the system on which electricity is generated and transmitted to distributing centres in this country, it will be instructive to consider a method that has been successfully applied in the United States to minimise system disturbances and reduce the duty that is expected of oil switches without sacrificing flexibility and economy of operation.

"Like a radio vacuum tube on the verge of oscillation—highly efficient, but damnably unstable"—is an expression which has been used facetiously, but which, nevertheless, has a sober application to solidly interconnected concentrated sources of power. In connection with an example of what has actually been accomplished in America, Mr. Alex. Dow, president of the Detroit Edison Co., was interviewed recently by a representative of the *Electrical World* regarding what he terms the "loose-linking" of his system, which has been gradually perfected since 1920, involving a generating capacity of over 500,000 kW and a mass of 24,000-volt cables. Fig. 1 indicates the method followed.

"What is the distinctive feature of this system?" Mr. Dow was asked. "Our system is not a closely connected unity served by several power houses," he replied. "Instead, I like to think of it as several contiguous areas having their own sufficient power houses interlinked primarily for mutual assistance and secondarily for the attainment of maximum economy. 'Loose-linking' is not new; continually increasing demands and generating capacity, together with the close knitting of the transmission system, forced us into it in 1920; the whole connected capacity was ever ready to spill an immense amount of energy into a fault whenever one developed. No company can afford to allow conditions to continue that are favourable to system-wide disturbances.

"Economy is subordinate to the first purposes of interlinking — namely, mutual assistance. Therefore, the manner and extent of interlinking should be such as will permit the transfer of energy between contiguous areas when needed and to the amount required by any controllable operating disturbance affecting the area which needs assistance. Interlinking should not be so tight that disturbances of the service that are temporarily uncontrollable will extend from the area in which they originate into contiguous areas. In other words, all of the ordinary chances of trouble, such as the disablement of a turbo-generator set, or the loss of an important line, should automatically bring sufficient assistance into the disturbed area from other areas, but an uncontrolled disturbance (some vicious short circuit causing generators and synchronous machinery to break out of step) should not be aggravated by having the energy of more than one area dumped into it; nor should such a disturbance be permitted to extend into other areas than that in which it originates. The foregoing requirements can be met by limiting the number of points at which energy may pass from one area to another and by providing adequate automatic switchgear at each of these points.

"The system operator, in consultation with the production department, assigns to each power house the amount of load it is to carry from hour to hour. Each large change of assigned duty will necessitate relimitation of the areas of supply, and the number and locality of the interlinkages in use at any time must be varied in consonance with the duty assigned for the time being to each power plant. The system operator must not only prescribe the points of interlinking and the normal carrying capacity of each interlinkage, but must in the final refinement prescribe the overload at which the interlinkage will automatically disconnect.

"One important requirement is that when a power house (or power area) breaks loose from the others, it should carry with it a proportion of the total load corresponding to that proportion of the total load which was assigned to it for the time being. If it carries too much load with it, a needlessly large amount of service will be affected by the disturbance; if it carries too little load with it, the other power houses will be temporarily overloaded. It is desirable that the interlinking of an area should not be effected with more than two other areas.

"At the Connors Creek plant the ring bus is split into two main sections, with generators and lines on each, resulting in two separate buses and transmission line groups. When these lines were tied together only at the sub-stations, the maximum short-circuit current at the Connors Creek plant was cut down considerably, but the current values in the sub-stations were not, because lines emanating from both buses were joined in the sub-stations. However, lines to the nearest sub-stations are being cut over at the power source, so that all lines to the same sub-station will be on the same main bus, but on different bus sections. This method of operating has been found satisfactory and separation of the station buses may eventually be followed by separating, or loose-linking, the steam system for similar reasons of reliability.

"While it is not the case now," pointed out Mr. Dow, "we are avoiding the installation of switches within large power houses to prevent switch wrecks putting the stations out of service. Interlinkage switching stations should also be separated from distributing sub-stations and should be located and built in due sequence in advance of necessity. The switchgear should have large excess capacity, or at least provision should be made to substitute quickly switches of larger capacity when conditions change.

"The 120,000-volt double-circuit loop around the outskirts of Detroit from Marysville to Trenton Channel primarily feeds the outskirts of Detroit without running high-voltage large-capacity cables from the generating plants themselves, but it also serves as a tie between our two most economical plants on the extreme opposite sides of our system. This loop, consisting of two parallel circuits each nearly 120 miles long, can be divided into approximately three equal parts by two sectionalising stations and is also tied at certain points, designated by the system operator, with the city cable system.

"Loose-linking represents only a partial separation of the system; all generators operate in parallel on the main system and carry the allotments of load as determined by their best efficiency. Although instantaneous exchange of power between two adjacent plants is normally limited to the one tie, considerably more load can be transferred between adjacent areas by different switching combinations at the various interlinkage stations. It has been possible to maintain the system economy as high as with the customary solid interconnection between stations, but without the possibility of serious derangement of the whole system which is thereby permitted.

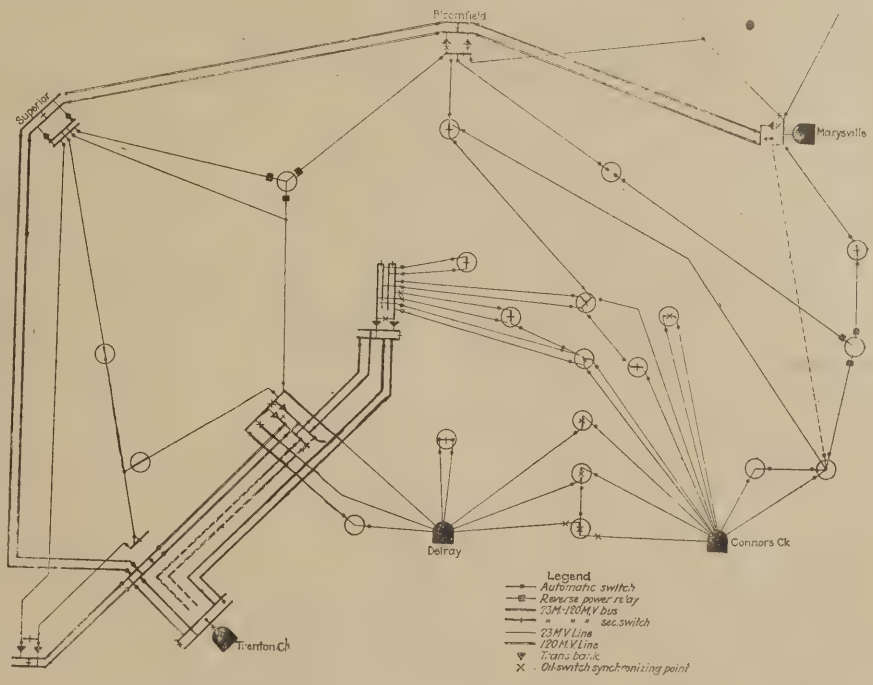

Fig. 1.—Method of "Loose-Linking" the Detroit Edison Power System.

"No more reserve capacity is required than in a system that is closely interconnected all of the time. Even if it were required, it is not so expensive to provide as many people think. The cheapest form is an oversize generator driven by a turbine with a manual-control bypass valve admitting h.p. steam to an intermediate stage, safeguarded by the governor, of course. The economy during emergency operation would be reduced, but would be more than offset by the saving in fixed charges on reserve capacity furnished in the usual way. Engineers are worrying too much over fixed charges when spending a little more than is technically economical may mean the difference between a desirable, and a merely satisfactory, or poor, service. Five per cent. increase in capital invested in a power house would hardly be noticeable in the cost of rendering service, and if spending this money produces more reliable service, it is an inexpensive way of securing better public relations.

"Advantages gained by loose-linking are greater reliability and stability of operation than we obtained five years ago, despite the fact that loads have increased in size and number and generating capacity has been augmented by two large

stations at Marysville and Trenton Channel. In addition, we have minimised circuit breaker duties and, consequently, the possibility of breaker failure, with possible equipment damage and most certain service interruption. Short-circuit currents were assuming values which no available circuit breakers could handle safely. Sustained short-circuit currents to any point of the system have been limited; in sub-stations the reductions vary from 15 to 55 per cent.; at Delray the reduction has been 38 per cent., and at Connors Creek about 29 per cent. with a closed ring bus (41 per cent. with a sectionalised bus). The reduction, even though the breakers disconnect the trouble promptly, also means lighter bumps on the system and less disturbance of the connected synchronous machinery; bumps are confined more to one generating plant and its area, and are not so keenly felt in the other areas. Isolation of trouble and prevention of promiscuous secondary disturbances enable a better diagnosis to be made and a quicker recovery to normal operation."

Mr. Dow does not contend that loose-linking supplants the necessity of reactors, or other methods that may be adopted. He recognises the desirability of greater certainty of relay action than is now obtainable. Nevertheless, he confidently believes that loose-linking can be applied to any concentrated power sources, with benefits equal to those he has obtained. The location of the plant and its size are less restricted than with solid interconnection.

Power Factor and Tariffs.

Types of Correction Plant and a New Three-part Tariff.

(*Abstracts of papers read before the* Institution of Electrical Engineers.)

At the meeting of the Institution on February 4th, two papers on the above subject were submitted, an excellent résumé of the first one (by Mr. E. V. Clark, who is in Australia) being read by Mr. E. L. Hill. The paper, which will be abstracted next week, contends that, although it has no energy content, the wattless component of electricity supplied to consumers has a real value to them, and in many cases entails a real running cost to the undertaking; that where low power factor is seriously perturbing a supply undertaking, a rational tariff should include a charge for wattless component, and that a charge based on the kVA-hours of lagging wattless component consumed, with an equal rebate for leading wattless component taken at time of load, is a reasonable basis for such charge, although not absolutely ideal; and finally, that the adoption of a three-part tariff embodying such a charge may be arranged without undue complication of metering methods, and without entailing perplexity in the minds of non-technical users of power.

The second paper, an abstract of which follows below, was written with the aim of following up the first one. It summarises the principal types of apparatus employed for the improvement of power factor, and describes the modern static condenser and also types of power-factor rectifying plant that have been developed during the past three years. The second part of the paper outlines various forms of power-factor tariff in force in Great Britain, and systems of metering employed in conjunction therewith are briefly dealt with.

Power Factor Improvement.

By E. W. Dorey, A.M.I.E.E.—*Abstract.*

Since Dr. G. Kapp's paper in 1922 there has been no addition to the types of auto-synchronous and synchronous motors therein described. The rotary condenser still finds favour in Great Britain, but it has a comparatively high loss, usually not less than 5 per cent., and may be as much as 7 per cent.; when this loss is capitalised, the rotary condenser, under the conditions ruling in Great Britain where power is mainly generated from coal, compares very unfavourably with other forms of p.f.-improving apparatus, such as static condensers. To take as an example a 1,000-kVA equipment, the difference in losses between static and rotary condensers would be of the order of at least 4 per cent. With a 12-hour working day, 300 days per annum, this would be the equivalent of 144,000 units lost, and at 1d. per unit sold this is approximately £600 per annum. If this difference be capitalised it will show the static condenser installation to be by far the more economical.

The adoption of p.f. tariffs has compelled designers to produce an induction motor with a very high inherent power factor, and the introduction of a.c. motors fitted with ball and roller bearings has assisted greatly; when the wear that is attendant upon the use of the journal bearing has not to be contended with, it is possible to use a much smaller air-gap.

Oil-immersed electrostatic condensers are manufactured in Great Britain principally by Messrs. British Insulated and Helsby Cables, Ltd., and the Telegraph Condenser Co., Ltd. They consist primarily of plates comprising a length of paper coated with tin under the Mansbridge process; the plates are separated by the requisite thicknesses of paper used as the dielectric, the number of thicknesses being dependent upon the voltage applied across the terminals of the unit. Generally speaking, each unit of the condenser has a capacity of approximately 1 microfarad, but this may be greater or less according to the special conditions obtaining on the circuit. The two principal makers assemble the units in frames, the frames being fixed into boiler-plate tanks and completely oil-filled. The modern oil-immersed static condenser is a very reliable and efficient apparatus.

A good deal has been said about the risk of resonance due to the connection of static condensers, but over many years no difficulty whatever has been experienced. It is not claimed that resonance may not occur under certain exceptional conditions, but under the ordinary industrial conditions prevailing, not only in Great Britain, but overseas, experience shows that resonance does not occur.

The static condenser, as built in Great Britain, is essentially a medium-pressure apparatus, the most economical voltage being about 600, but condensers have been, and are, built for direct connection to supplies up to 3,300 volts. Only in exceptional cases is it cheaper to supply a h.p. condenser, and the saving is not even then more than 10 to 15 per cent. of the overall cost of the equipment. The right place to put the condenser is in the l.p. circuit, as by so doing the improvement will be effected as far as possible out on the distribution network, and in practice the call for h.p. condensers is very small.

A case has been reported from overseas of a British-made 100-kVA, 3,300-volt, outdoor condenser which, for the purpose of test and experience generally, is connected direct across the h.p. overhead transmission line without any protection whatever, and is therefore subject to every kick and surge on the system. Nearly 12 months have elapsed since the condenser was first connected and it continues to give every satisfaction. This should be sufficient evidence to show that the static condenser does not in reality possess the attributes of frailty so frequently ascribed to it.

A comparatively new development is the l.p. pole-type condenser connected direct across pole-type step-down transformers, this application being particularly useful in the case of rural distribution. British-made condensers of this type have been working for some considerable time in New Zealand, and it is reported by the engineer of one Power Board that, from the point of view of improved regulation only, the installation was worth while. In this case, however, the annual saving effected is sufficient to repay about 70 per cent. of the cost of the equipment, and to this has to be added the increase in the useful output of the transformer, as the condenser being connected on the low-pressure side of the step-down transformer unloads the transformer of wattless current, and for every 2 kVA of condenser capacity under industrial conditions the load on the transformer will be reduced by approximately 1 kVA.

The efficiency of the static condenser is 99.7 per cent., so that the losses are almost negligible. A bank of directly-connected condensers having an output of 1,000 kVA would have a loss of only 3 kW. Where auto-transformers are used for stepping up the voltage from that of the supply to the most economical voltage for the condenser, the auto-transformer losses have to be added, but the overall losses of large complete equipments for the usual industrial voltages may be taken to be between 1 and 1.5 per cent. of the output in kilovolt-amperes.

With the two makes referred to, the type of unit used in either case would be the same; therefore, at 440 volts the condenser would require to be 86 per cent. larger and approximately 80 per cent. more costly than at 600 volts. To overcome this it is usual to step up the voltage by means of an auto-transformer to the most economical voltage for the condenser (in the above case, 440 to 600 volts). The auto-transformer is comparatively inexpensive and the overall reduction in price for the complete equipment is very considerable.

Where new step-down transformers are necessary, either as separate units or to bank with existing transformers, and in addition a condenser is required, it is possible to overwind the secondary of the transformer to give the most economical voltage for the condenser. By this means the auto-transformer is avoided and the whole scheme simplified, a considerable monetary saving being effected.

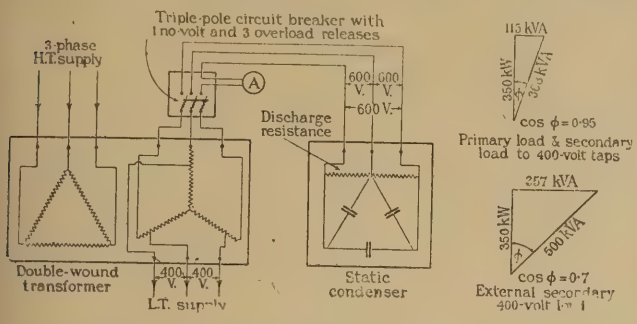

Fig. 1 shows the loading and phase angle of the various circuits of an overwound-connected condenser equipment.

Where a supply undertaking is faced with bad voltage regulation and low power factor, whether or not a power-factor tariff is in force, it should be possible to improve matters considerably by connecting direct across the l.p. busbars in each sub-station feeding industrial load sufficient condenser capacity to neutralise the magnetisation current of the whole bank.

A great advantage of the static condenser is its mobility; it can be put at the end of an over-loaded circuit, but if later on this circuit is underloaded, it can be moved to another position as may be required. The price per kVA of condenser capacity varies according to voltage, frequency, and climatic conditions, but, taking conditions in the United Kingdom and a three-phase 50-cycle supply at from 400 to 440 volts, the cost of equipment ranging in size from 100 to 300 kVA varies

approximately from £3 5s. to £2 9s. per kVA, a good average figure being, say, £3 2s. per kVA.

The "phase-advancer" is an a.c. exciter to improve the p.f. of a slip-ring induction motor. These exciters literally short-circuit the slip-rings and inject the necessary leading current into the rotor. Phase-advancers have been used extensively on the Continent, but do not appear to have found much favour in this country.

Load on primary = 368 kVA (resultant of two secondary loads).
External load on secondary at 40-volt tappings = 500 kVA.
External load on secondary between neutral and 400-volt tappings = 368 kVA (resultant of two secondary loads).
Load on 400-600 volt winding = 300 kVA (condenser load).

Fig. 1.—Loading and Phase Angle of Overwound Equipment.

A comparatively new type of induction motor capable of running at a high power factor at all loads is the so-called compensated induction motor. Among machines of this type is one built by the British Thomson-Houston Co., Ltd., with the trade name of "No Lag." Machines of this type can be built in sizes up to 200 or 300 h.p. for either two- or three-phase circuits up to 600 volts at any commercial frequency. The motor has a commutator which enables the phase of the secondary to be controlled and, hence, the power factor to be corrected. The kVA handled by the commutator is very small, and so it is very small with simple and inexpensive brushgear. This motor is as simple to operate as a plain induction motor, and standard starters as used for the slip-ring-type induction motor can usually be used. It is capable of giving as large a torque at starting as the slip-ring induction motor.

Fig. 2 is a typical power-factor curve of a 17½-h.p., 1,000-r.p.m., 415-V, 50-cycle "No Lag" motor, and, if desired, a leading p.f. of 90 per cent. at full load can be obtained, and in certain cases an even greater leading power factor. Fig. 3 shows the speed and efficiency characteristics which approximate to those of the plain induction motor. It is an asynchronous motor, so that for applications where a slight drop in speed with increasing load is necessary, or desirable, it is admirably suited. As no separate exciter or expensive switchgear is necessary this motor is less expensive than the auto-synchronous motor, and it can be built in small sizes of the end-shield type.

It is reasonable to assume that the time is not very far distant when the great majority of undertakings supplying alternating current will adopt some form of power-factor tariff. The p.f. tariffs in force in Great Britain may be divided as follows:—

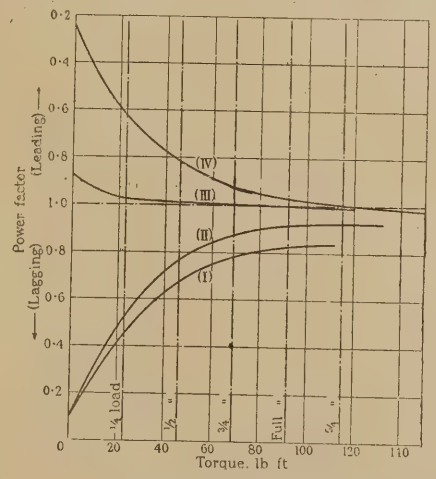
Class (A).—A two-part tariff incorporating a fixed charge per month, per quarter, or per annum, per kVA of maximum demand, with a running charge or flat rate per unit consumed.

Class (B).—A tariff which may be either of the two-part type based on the kW demand and the running charge per unit, or a one-part tariff based on units consumed only; in both cases, however, subject to a percentage decrease or increase, bonus/penalty, depending upon the power factor of the load. The tariffs divide themselves into those which give a bonus for reduction in kVA demand only and those which give a bonus on the total bill, that is, the capital charges and running charges. The majority of electricity supply undertakings are favouring the kVA demand tariff, owing to its simplicity; a satisfactory meter can be provided to record the kVA demand and an explanation of the term "power factor" is not involved. In the case of Class (B) tariffs, difficulties are met with in getting the consumer to put in plant for the improvement of power factor, the chief of which are as follows:—

(1) In the case of an overall bonus/penalty on the power-factor supply bill, a consumer with a relatively high load factor has a large supply bill compared with the low-load-factor consumer, both running with the same maximum demand and power factor. To improve the p.f. would require the same condenser capacity in each case, but the consumer with high load factor would get a proportionately greater saving than the one with low, and the inequity of this type of power-factor tariff is very evident.

(2) In those cases where a bonus is given for improvement of power factor above definite limits, such as 85 and 90 per cent., the objections referred to in (1) above also apply, but in addition there is the serious objection that the consumer with, say, 83 per cent. p.f. can, with a comparatively small condenser, correct to either 85 or 90 per cent. and obtain the bonus, but the consumer with a very low p.f., say 50 per cent., would have to correct right up the scale to, say, 84 per cent., without getting a penny piece by way of bonus; in other words, the low-p.f. consumer would have to put in such large condenser capacity that in the majority of cases it would not pay.

(3) This type of tariff involves an explanation of the term "power factor," and it will be generally agreed that the less explanation one has to give to the consumer the better.



The correction of low power factor is one of the few important economies remaining to be effected, and there seems little doubt that, converted into £ s. d., low power factor is resulting in enormous losses to electricity supply undertakings, not only as regards capital charges, but also running charges, and the losses are being borne by the industrial user of a.c. power. Admittedly, the consumer is responsible for the power factor of the load, but it behoves every undertaking supplying a.c. power to make it worth while for the consumer to raise his power factor and thereby effect a general reduction in electricity charges, thus ultimately benefiting industry in general.

Discussion in London.

Mr. R. O. KAPP opened the discussion by remarking that so much had been written and said about the subject that one would have thought there was nothing left to discuss; both the papers before them that evening, however, contained something new and important. There were two aspects of tariff making: one was the accountant's point of view based on detail costing, and the other was the salesman's point of view, who had to consider many points which the accountant could neglect, including the mentality of the consumer, &c. With regard to Mr. Clark's paper, it did not sufficiently emphasise this salesman's point of view. Bad power factor meant bad voltage regulation, particularly on systems that included many transformers and overhead lines, especially at low pressure. The analogy the author drew from the sale of concentrated and weak sulphuric acid was a very important point. The framing of tariffs should be done with due consideration for the "ignorance" of the consumer; for example, if a bonus were offered the consumer would probably "understand" a tariff much more readily than if a penalty were imposed. A 3-part tariff assumed that the 2-part tariff was based on accurate cost accounting with the introduction of a refinement, but was the average 2-part tariff a true accountant's tariff? The allocation of cost was not easy, and a close approximation to true costing seemed to be hardly possible. Concerning Mr. Dorey's paper, he (the speaker) could confirm the statement that the risk of resonance due to the employment of condensers was by no means serious. The author's details of pole-type condensers were very welcome, as such appliances should have a big field in front of them for rural electrification. A.c. fans had a bad power factor, and he had once had to consider the correction of such a load, but the cost had been prohibitive. Could the author say whether condenser correction would be possible now, either for individual fans, or for groups of fans?

Mr. S. H. HART pointed out the advantages of using motors of a good design and running induction machinery at as high a speed as possible to improve the power factor. Large consumers could be dealt with by means of a tariff, but the small consumer would have to be provided for in co-operation with the supply authority.

Mr. W. B. WOODHOUSE, speaking as a supply undertaker, said that idle current did cost the supplier something, and therefore the consumer should pay for it. Small consumers could not be expected to carry out p.f. correction; the supply authority could do it and charge the consumer accordingly. Large consumers, however, could do their own correction, and they should be offered a suitable tariff. In one case he knew of a saving of £2,000 had resulted in one year and in another case the saving had been £6,000, the inducement to correct

(I) Power factor as induction motor.
(II) Power factor as compensated induction motor; min. compensation.
(III) Power factor as compensated induction motor; unity power factor.
(IV) Power factor as compensated induction motor; max. compensation.

Fig. 2.—Power Factor Curves of Compensated Induction Motor.

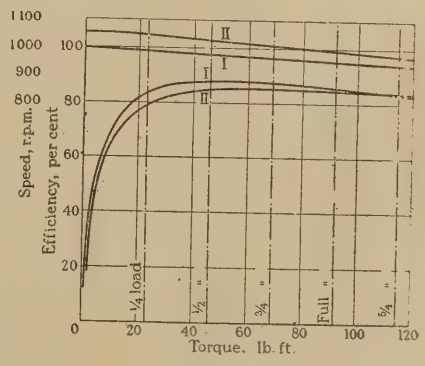


Fig. 3—Efficiency and Speed Curves of Compensated Induction Motor.

being a charge on the kVA basis. The method of charging, however, needed some consideration: Should the charge be based on the sum of the idle ampere-hours, or on the idle current at the time of maximum demand? The latter was perhaps nearer the fact, but there was no really suitable meter for such a system at present.

Mr. R. A. Chattock (president) pointed out that p.f. correction depended on the nature of the supply that had to be given. On a d.c. system, for instance, rotary converters at the most important parts of the network would assist materially in keeping the main trunk lines well loaded up, which was a necessity. Offering discount as an inducement would not pay in Birmingham at present. Regarding the use of condensers in rural districts, it should not be forgotten that if a condenser were left in a circuit at night, when the load was off, it would result in the supply network having a serious leading factor and introduce difficulty in connection with voltage regulation.

Mr. L. W. Migotti said he came from abroad (South America) and he claimed to supply a large amount of energy, but not one of his consumers would take the slightest interest in power factor, except perhaps the British railway officials, who, however, were not yet being supplied. Nevertheless, they had a power factor of from 0.93 to 0.97 at the peak load, which was the most important time. Their method was to estimate what they expected to receive from each consumer and charge him accordingly. In general, the consumer should not be worried about power factor unless he was fully fitted to understand the subject. Correction, where necessary, should be carried out by the supply authority with the help of the designers of machinery.

Mr. A. H. Bennett thought that Mr. Clark had tried to prove on paper something that was not really necessary. All that was required could be accomplished by means of a 2-part tariff. They never attempted to explain power factor to a consumer, but they did show him what it would mean to him in £ s. d., and at the same time offered a condenser on the hire-purchase system, which was usually accepted. The public did not want electricity, but energy, and it was up to the suppliers to give it them. It would be worth the consumer's while to improve his power factor to something over 0.9.

Mr. P. M. Baker expressed the opinion that any tariff which required the consumer to understand power factor was quite hopeless.

Mr. Johnson knew of some consumers charged on the kW basis who had a power factor of 0.4. The whole trouble was due to induction motors being allowed to work at one-third load. Manufacturing costs and other such considerations limited the possibility of reducing the air gap of motors, and static condensers could not be used when the load was variable, whereas motors could be so used. The Clyde Valley case was due to the peculiar geographical position of the generating stations. The use of auto-synchronous motors was a commercial proposition where other means were not justified, and such machines had now been applied to every class of industrial use. Static condensers had limitations which were very soon reached.

Mr. H. S. Ellis drew the author's attention to an instrument known as the "Maxigraph," which he had used and found quite reliable. It was provided with a recorder as well as an indicator and gave the p.f. record on a basis of time.

Mr. E. W. Dorey, in reply, said that small condensers could now be supplied with fan motors and they should have a very wide application in the tropics. In the case of bulk correction a condenser might give a leading p.f. when only two or three of the fans were in use, so that individual correction might be preferable. Squirrel-cage motors were most reliable and would be efficient when installed in combination with static condensers, if the cost proved to be suitable, but each case must be considered on its merits. He often wondered why supply authorities did not do more correction themselves; the chief reason was probably due to voltage regulation problems, because when the consumer carried out the correction his condensers were switched off as the load decreased. A kVA-demand instrument was available, and it was a very reliable meter, although expensive. It was interesting to hear that although Birmingham and Manchester were well situated as regarded power factor, they offered inducements to consumers to correct their power factor. Automatic switchgear might be devised before long to cut out the condensers as the load fell, otherwise it might be advisable to split up condenser capacity. Where kVA-demand tariffs were in use, it was very much easier to induce consumers to install p.f. correcting apparatus.

A Large Frequency-changer—A frequency-changer, said to be the largest piece of electrical machinery of its kind ever designed, weighing more than 600 tons, has been ordered by the Philadelphia Electric Company from the Westinghouse Electric and Manufacturing Company. The contract also calls for the delivery of eight oil circuit breakers for a voltage of 73,000 V and a rupturing capacity of 1,500,000 kVA. The machine will be installed in the Schuylkill River station of the company, to change the frequency of the generated current to that necessary for traction purposes. It will be 55 ft. long, and will rise to a height of 22 ft. above the foundations; the motor section of the unit will develop 60,000 horse-power at 100 per cent. power factor, or 41,250 horse-power at 70 per cent. power factor.

The Lighting of Coal Mines.

Some Interesting Miners' Electric Safety Lamp Tests.

At a recent meeting of the Illuminating Engineering Society in London, at which Mr. C. C. Paterson presided, a discussion on the subject of "The Lighting of Coal Mines" was opened by Mr. Eric Farmer, investigator to the Industrial Fatigue Research Board, who described a series of recent tests which indicate the importance to be assigned to the exposure of the bright filaments of miners' electric lamps. He explained that methods of diffusing the light, *e.g.*, painting the inside of the protecting glass cylinder with hydrofluoric acid, had an evident good effect in diminishing the intensity of "after images" and reducing glare. Although this occasioned some loss of light, it was found that 53 per cent. of subjects had better visual acuity with the translucent light than the transparent; 32 per cent. had equal vision in both cases, and only 14 per cent. had lower visual acuity with the translucent glass. The tests thus supported the view that the diffusion of the light was an advantage, and it was found that in the case of men suffering from "nystagmus" the effect was particularly beneficial. Nevertheless, methods of diffusion would yield still better results if a higher illumination could be provided, and in this connection Mr. Farmer mentioned the possibility of larger batteries being employed, which would enable lamps of higher candle-power to be used.

The hon. asst. secretary read letters from the Rt. Hon. William Brace, M.P., and Mr. Henry Walker (of the Mines Dept.), Mr. E. Fudge (secretary of the Miners' Lamp Committee) and Mr. Frank Hodges (Miners' International Federation), expressing their interest in the meeting and their recognition of the importance of good lighting. Communications from Dr. T. L. Llewellyn, Dr. H. S. Elsworthy, and Prof. W. Thornton were also read. Dr. Llewellyn referred to recent advances, such as the greater use of electric lamps, improvements in both oil and electric lamps, and the whitewashing and stonedusting of underground passages. He believed strongly in the cap-lamp, but this pattern had not been a success except in some districts of Scotland, although it was almost universally used in America. Dr. Llewellyn also endorsed the importance of avoiding glare, but preferred to overcome it either by careful placing of the lamp, by the use of the cap lamp, or by reflectors. Translucent glass had not been well received by miners, but yellow glasses seemed to meet with approval. During the journey to the coal face the use of a shade at the back of the lamp should be compulsory; it was very trying to the eyes to follow a line of unshaded lamps, and difficulty in this respect was an early symptom of eye-trouble.

In conclusion, Dr. Llewellyn presented data for nystagmus and cases of disablement, which showed a disappointing increase during 1923 and 1924. This was doubtless attributable largely to abnormal conditions, and he still believed as strongly as ever in the importance of better light.

Dr. H. E. Elworthy's communication was confined to the use of yellow-tinted glasses. Data presented for a colliery in which they had been adopted showed a marked decrease in the number of cases of nystagmus.

Prof. W. Thornton's communication suggested that, if miners felt the same confidence in the electric lamp as a detector of gases as they felt in the oil lamp, this would overcome a great deal of the reluctance in adopting the former. Nystagmus, in some cases, was partly a mental effect, an "apprehension neurose." Prof. Thornton also indicated the possibility of conveying electricity to working places by suitable cables, using low-voltage a.c. at higher frequencies than those at present used. The idea would need careful testing, but similar methods were already used for signalling purposes.

An interesting discussion followed, in which Mr. J. B. Lawford (past president of the Council of British Ophthalmologists), Dr. D. G. Coles, Dr. Miles, Mr. W. Plummer (Ceag Miners' Supply Co., Ltd.), Mr. S. J. Wrigglesworth (Oldham & Sons, Ltd.), Dr. R. Lessing, Mr. E. A. Hailwood (Ackroyd & Best, Ltd.), Mr. Cooke, Mr. T. J. Sack (G.E.C.), Mr. L. Gaster, and Mr. C. C. Paterson (chairman) took part.

A point strongly emphasised in the discussion was the desirability of supplying bulbs for miners lamps of good quality, operated at a reasonably high efficiency. Mr. T. J. Sack pointed out that small 2-volt lamps for miners' lamps could not be expected to have a life comparable with that of the ordinary household lamp, and that to insist on a life of 1,000 hours meant an efficiency not high enough to give even the legal minimum of 1 c.p. The great gain in light secured by adopting a higher efficiency was strikingly illustrated by a demonstration, and the candle-power attainable from gasfilled lamps, operated at a somewhat higher voltage, was also shown. Mr. Plummer exhibited a "Ceag" lamp working on a 4-V accumulator, giving four times the light from a standard lamp with less than twice the weight.

Other points referred to included the cap lamp, and the possible explanation of the preference shown by miners for the yellow-tinted glass cylinder. Mr. Hailwood dwelt at some length on available statistics relating to nystagmus, and exhibited some lamps of the flame type.

After a vote of thanks to the author and exhibitors, it was announced that the next meeting would be devoted to an exposition of the work of some of the B.E.S.A. committees concerned with various aspects of illumination.

Russian Electrical Notes.

Scarcity of Raw Materials.—The State Electrical Trust (the amalgamation of the Central and the Leningrad trusts) reports great difficulties in obtaining the necessary quantities of various raw materials for the different manufacturing works. This is the case with dynamo and transformer iron and certain qualities of steel, and the question of importing the balance required has been put before the General Electrical Commission as the controlling authority of this trust. The dearth of zinc, lead and tin is said to be even "colossal."

The Schatur Peat Fuel Station.—The Schatur station, which employs peat fuel, and is expected to form the main basis of supply for Moscow, was originally projected for a capacity of 48,000 kW. Owing, however, to the growth in the demand for energy in Moscow it is now proposed to add to the station a 35,000-kW turbo-generator and to build an annexe to house a set of not less than 25,000-kW capacity. It will also be necessary to install six further boilers, and foreign firms have offered to deliver these in May if the orders are placed in January.

Automatic Telephone Exchanges.—The production of automatic telephone exchanges with a capacity for 10,000 subscribers is reported to have been commenced at the Kulakoff works. Hitherto such exchanges have only been constructed in Russia to accommodate 1,000 subscribers.

Interconnection of Stations.—The Nischni-Novgorod station has now been connected up with the Balachn generating station and will regularly receive a supply of energy from the latter. It is intended that the Balachn station shall also furnish electricity to a number of industrial undertakings in the r gion of Nischni-Novgorod.

Production and Demand.—Despite the development of the producing industry it is impossible fully to satisfy the requirements of the market. The production of machines and apparatus in 1924-25 represented a value of 15,500,000 pre-war roubles, which only met the demand to the extent of 75 per cent. In the current year the value of the output of the General Electrical Trust in machines and apparatus is estimated to be 24.5 millions of roubles, but even if this is realised the market will only be supplied with 90 per cent. of its needs, according to the estimates of the General Electrical Commission. It is at present difficult to judge whether this programme of production will be carried out, as the whole were already practically loaded to their full capacity in 1924-25 and any further expansion will depend upon the provision of new equipment. The estimates of the Commission anticiplate that the home demand for machines and apparatus will increase to 39 million roubles in 1926-27, 53.8 millions in 1927-28 and to 67 millions in 1928-29. The manufacture of cables is situated in the relatively best position as beside the cable factories of the general trust there are factories belonging to the Tsbetmeta and the cable factory in Kieff, which will not be fully occupied in the current year. On the other hand the factories of the General Electrical Trust, which turned out cables to the value of 22.5 million roubles in 1924-25, will manufacture to the extent of 33 million roubles in the current year. In the case of lamps it is mentioned that the demand is growing simultaneously with the production, while the imports are constantly diminishing and now only form about 5 per cent. of the total number placed on the market, most of the imports being gasfilled lamps. The development of the home manufacture of lamps is illustrated by the fact that the total output of all the factories amounted to 6,500,000 in 1923-24. 10,500,000 in 1924-25, and the number is expected to be increased to 16,500,000 in the current year. Besides the national production of installation materials at various works, a considerable quantity is imported from other countries. Owing however to the variation in nomenclature consumers are said not always to be able to find what they require, and the General Electric Commission therefore proposes to work out a system of standardisation. Fittings and heating appliances are not entirely covered by home production so that in these cases also a quantity has to be obtained from abroad. The value of the output capacity of the works producing fittings is stated to be 3.5 million roubles and the production of heating appliances is said to amount to 2 millions of roubles. Notwithstanding extensions the home output of carbons is also unable to satisfy the demand, while only 50 per cent. of the market requirements is met by the home production of ammeters, voltmeters, &c.

Steam Turbine Construction.—A conference on the question of the economical construction of steam turbines in Russian works was held in Leningrad at the beginning of January, between the General Metal Commission and the Leningrad Machine Trust. It was stated that the cost of constructing a 5,000-kW turbine was not only greater than the cost of a foreign machine (270,000 roubles as against 200,000 roubles) but also that the steam consumption was higher in the case of the Russian turbine. The conference reached the conclusion that the causes of the higher price were the scarness of materials and the limited number of orders, and it was decided to put before the competent economic bodies the question of the policy to be observed in future in the matter of the construction of machines at Soviet works.

Moscow Supply Developments.—The minimum demand for energy on the stations which supply Moscow is expected to amount to 160,000 kW in the autumn of this year, but as delay may take place in the installation of the third generator at the Schatur station, there will only be a reserve of about 4,000 kW available. Should this contingency arise it will be necessary to make a change in the hours of supply to consumers and temporarily cease connecting up new customers. In 1927 the capacity of the Moscow stations will be increased to 287,000 kW by the erection of a machine of 35,000 kW at the Schatur station, a machine of a similar size at the new Kaschir station, the addition of one of 16,000 kW at the old Kaschir station, and the erection of two units each of 16,000 kW at the first Moscow station. In general the expenditure will be defrayed out of the profits of the Moscow supply undertaking (Moges) for two years and by the utilisation of the redemption fund

Tramway Motors.—The two trusts which are now embodied in the General Electrical Trust have for the past two years been occupied, among other matters, in assisting in the restoration and extension of the tramways in various towns and in the construction of new types of motors and controllers. New motors of 100 h.p. were built at the beginning of 1924, together with motors of 50 h.p. and these are claimed to be equally as good as foreign types. The value of the orders for tramway equipment placed with the trusts rose from 800,000 roubles in 1922-23 to 2,500,000 roubles in 1923-24 and to 5,000,000 roubles in 1924-25, and the output will be considerably increased during the current year. The trust is contemplating the introduction of electric traction on the railways, and a beginning in this direction is to be made by the Commission for Ways and Communications in connection with the Moscow surburban lines in the near future.

Colliery Electrification.—An expenditure of 14,196,000 roubles is being incurred this year on the electrification of the coal mines in the Southern basin of the Donetz, and of this total about 7,000,000 roubles has been or is to be spent on the acquisition of electrical equipment from abroad. Excluding a few exceptional cases, all the mines will receive a supply of energy from the Shteroff generating station, which will be put into operation next June, when 17 mines will be electrically equipped, out of a total of 21 mines for which plant of 6,680 kW has already been ordered.

Transformer Failures.—At the Krasnaya Svesda generating station (62,000 kW) at Baku a breakdown is reported to have taken place in one of the two 12,500 kW transformers made by the Kharkoff works of the former Central Electrical Trust. This is the second recent failure, a 2,000/20,000 V, 2,000 kW transformer having previously burned out and caused a fire in a sub-station.

English Engineers in Russia.—It is reported that English engineers representing Vickers Ltd., arrived in Leningrad in the third week in December for the purpose of undertaking the erection of equipment for the principle sub-station of the Volkhoff hydro-electric works. The installation of high-pressure transformers, each weighing 45 tons, necessitated the construction of special platform trucks at the Putiloff works.

New Stations. — The Electric Planning Commission has expressed the desirability of commencing the construction of a regional station in Artemovsk of a capacity of from 16,000 to 20,000 kW, with a transmission line from this place to Rostoff. The expenditure is to be defrayed out of the funds included in the budget for this year, and by local capital.

The Commission has also had under consideration a scheme for the establishment of a hydro-electric works for the utilisation of the Falls of the Purt at Gizel-Don for the supply of energy to Vladkavkaza, and a number of towns in the Beslansk district, as well as for metallurgical purposes. The capacity of the station is put at from 6,000 to 9,000 kW.

Submarine Cable Restoration.—The Commission of Posts and Telegraphs is about to begin the restoration of the submarine cable between Baku and Krasnobodsk in the Caspian sea. This cable was damaged in many places and has been out of service since 1920. A period of three months will be required to complete the work.

Defective Products.—A committee has been dispatched to the mills of the Gusevsk combination to investigate complaints made by the managers concerning alleged defective equipment supplied by the General Electrical Trust. In general the complaints concern the small motors provided for the weaving looms, no fewer than 12 motors out of 44 having burnt out between October 23rd and November 11th. At the same time two large 6,000 V motors which were imported broke down on the day they were put into operation. As to the failure of the small motors of from 3 to 5.5 h.p. the Trust states that their construction was hurried in order to ensure delivery by the stipulated time; the large motors were tested at the works and taken over by a committee which included representatives of the Gusevsk. In addition it is stated that defects have been discovered in the measuring instruments supplied by the Low Pressure Trust. The electrotechnical section of the conference now sitting on the quality of Soviet manufactures has presented a report dealing with the complaints made concerning the glow lamps turned out by the lamp factories. Despite the improvements already carried out, the conclusion is reached that insufficient care is taken at the lamp factories. The section states that the telephones are inferior to those produced before the war, the reason assigned being the inadequacy of raw materials of the desired quality. It is now suggested that the Electrotechnical Institute should be em-

powered to obtain the services of foreign specialists to assist it in the investigation of the problem.

Defects are reported to have been discovered in boilers at the Sverdloff generating station built by the Leningrad Machine Trust. A commission has been sent to investigate the matter; the defects are said to be due to the absence of representatives of the Trust on the occasion of the erection of the boilers.

Automatic Telephones.—Having in view the realisation as quickly as possible of a scheme for the introduction of automatic exchanges, the Low Pressure Trust has purchased a large quantity of necessary appliances and materials in Sweden. The payment for the orders has been guaranteed by the Bank of Industry.

Rural Electrification.—Adopting a report of the National Commission of Finance and the State Planning Commission, the Council of the National Commissioners has decided to allot 15,350,000 roubles to works of electrification this year in rural localities. Of this total 5,000,000 roubles will be derived from the loan for economic restoration and the balance will be assigned from the State budget.

Electrical Wholesalers' Federation.

Annual Dinner.

THE annual dinner of the Electrical Wholesalers' Federation was held at the Trocadero, W., on February 4th, with Mr. A. HOLMAN (president) in the chair. After a well-served dinner and the loyal toast, Mr. A. G. BEAVER (past-president) proposed the toast of "The Distribution of Electric Supply and Supplies." The speaker referred to the Government's electricity proposals and said that although details were not yet available it had been indicated that development would be left in the hands of private enterprise. It was said, however, that municipal authorities had been advised to apply for full trading powers. If this was a part of the Government's Bill it would be strenuously opposed by the industry. There were municipalities which realised that their best interests were served by working with and through the contractor, but a change of committee might alter this attitude and if full trading powers were possessed they would be utilised. The history of the gas industry would be repeated, where the companies supplied the appliances and did the work and took their profit through the gas consumed. Manufacturers should consider the possibilities. He considered that agreements limiting the scope of municipal trading activities should be arrived at between the interests affected. He pleaded for unification and co-ordination of all branches of the industry; the E.D.A. was the proper body to undertake this task. In conclusion, he said that, so far, the contractors had fought municipal trading alone, but it was now the intention of the E.W.F. to give them adequate support.

Mr. T. ROLES (past-president, I.M.E.A.), replying to the toast, said that his department at Bradford had full trading powers and was exercising them to a certain extent. Electricity was already cheap in the large provincial towns and the Government would find it difficult to secure lower prices. It had to be borne in mind that electricity could be taken to the people, but they could not be forced to use it. Cheap coal had retarded the use of electricity for power; moreover, steam had often to be raised for process work, and the question of driving became a minor item. There were other adverse factors, but in spite of industrial depression, the load had continued to grow, which pointed to an expansion in the domestic use of electricity. With regard to rural development he thought the city consumers would refuse to be bled to support non-paying schemes. The only way to reduce the price of electricity was to increase the output. That could best be effected by unification and consolidation and persistent propaganda. With regard to municipal trading the Government's Bill would no doubt upset a number of interests, but the good of the nation as a whole must be the first consideration.

Mr. D. N. DUNLOP (director B.E.A.M.A.) also replied to the toast. He said that he did not think that it was the Government's intention to interfere with efficient stations. He did not view the matter as a purely electrical problem. He thought that the Government's scheme was an effort to make the best use of our coal resources, and no doubt the gas industry would have to be considered in conjunction with it. The proposal to place the Executive Board under the Electricity Commissioners was an unusual arrangement and not altogether satisfactory. The Board should consist of men of very great experience and should have complete control. The standardisation of voltage and frequency would need very careful treatment and existing conditions in some important areas should not be disturbed until a proper state of development was reached. He did not agree with the suggestion that the E.D.A. should be asked to call the sections of the industry together with a view to co-ordination, it already had enough to do. The sections concerned should get together themselves and thrash out the whole matter. Referring to municipal trading, he said that he hoped that every enlightened municipality would see the need for the wholesaler and contractor.

Mr. H. H. BERRY, in proposing the toast of "Our Guests," referred to the recent death of Mr. Tate, the secretary of the Electrical Contractors' Association, and the company stood in silence as a tribute to his memory. Mr. Berry then made reference to the presence of Mr. T. Alger (president of the E.C.A.), Mr. W. Preston, M.P., Mr. J. W. Beauchamp (director E.D.A.), Messrs. Sully and Fletcher (E.L.M.A.), Mr. Atkinson (director C.M.A.), and Mr. Cramb (I.M.E.A.).

Mr. T. ALGER, in responding to the toast, said that the wholesaler and contractor were placed in a serious situation in connection with municipal trading. The contractor's business was immediately affected, but the wholesalers would eventually feel the strain. This trading was the thin edge of the socialist wedge, and he was very glad that the E.W.F. had decided to support the E.C.A. in its fight against these powers. The House of Lords Committee which gave full trading powers to Bath, Barrow and Burnley last July, did not know what a serious thing it was doing. The contractor had trained fitters, had canvassed and done a great deal of pioneer and educational work, and he should be given a "place in the sun." Elaborate and expensive showrooms and installations which cost more than a consumer was charged, must either be paid for by high electricity charges or by the ratepayers as a whole.

Mr. W. PRESTON said that the electrical manufacturer had every reason to promote the welfare of electrical traders. Energies should not be distributed among sections. There might be too many intermediaries in the coal trade, but this was not the case in the electrical industry; the wholesaler was indispensable. In conclusion, he appealed for the support of British manufactures in spite of the flood of cheap foreign material.

Mr. J. WILSON proposed the health of the president, and Mr HOLMAN briefly responded.

During the evening a musical programme was provided by the Misses Cathcart Lynn, Jeane Paule, and Leonie Lascelles.

Notes from Canada.

(From Our Canadian Correspondent.)

SOME weeks ago a scheme to utilise the great rise and fall of the tides in the Bay of Fundy for power purposes was voted upon in the State of Maine, U.S.A., and received the approval of the electorate. Mr. Cooper, a well-known United States engineer, proposes to spend about 75 million dollars for the purpose of developing from 500,000 to 700,000 h.p. in order to furnish electrical energy for the needs of Eastern Canada and the eastern United States. The scheme would involve building a series of dams from the mainland of Maine to that of New Brunswick, Canada; by this means, according to the *Canadian Engineer*, two basins, 100 and 50 square miles in area, in the Passamaquoddy and Cobscook Bays, respectively, would be formed. The dam gates to the larger basin would be kept open during rising tides and those to the smaller during falling tides. The scheme is of interest to Canada because one end of the dams would be on Canadian soil and also because part of the electricity generated would be available for use in this country. Mr. Cooper believes that the project can be financed if proper agreements between the Governments of the two countries can be arrived at.

Another proposal of a unique character has recently been given publicity by Mr. C. Lorne Campbell, a Toronto engineer. Mr. Campbell believes that two of the rivers (Albany and Ogoki) now flowing into James and Hudson Bays, could be dammed and made to run southward—by cutting a canal through the height of land—to the Nipigon River, whence their waters would reach Lake Superior, thus finally arriving at the Atlantic Ocean by way of the Great Lakes and the Niagara and St. Lawrence Rivers. This bold plan would create a sixth great lake about twice as big as Lake Ontario, measuring some 200 miles by 90 miles and submerging about 18,000 square miles of land.

The extra water flowing in the new direction would, it is claimed, furnish about 200,000 more horse-power at Camero Falls, near Port Arthur, where the Hydro-Electric Power Commission of Ontario has its Nipigon development; about 50,000 h.p. more at Sault Ste. Marie, and about 300,000 h.p. more on the Niagara River. The cost of the proposed scheme is estimated at about $200,000,000. No mention seems to have been made of extra power being made available on the St. Lawrence River, but there would certainly be some. The level of the Great Lakes would also be raised a little, which would benefit navigation. The land to be submerged contains much timber suitable for pulpwood and other purposes which, according to the author of the scheme, could be cut and sold. Such a plan would take a long time to get started on account of the many factors, legal, financial, and engineering, which would have to be considered.

The Iron and Steel Institute.—The annual meeting of the above Institute will take place on May 6th and 7th, at the Institution of Civil Engineers, Great George Street, London S.W.1, by kind permission of the Council, and the annual dinner will be held on May 6th, at the Connaught Rooms, Gt. Queen Street, W.C.2. It is expected that, by the kindness of the Swedish Ironmasters, the autumn meeting, 1926, will take place at Stockholm. As soon as the arrangements have been confirmed, the date and further details will be announced.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

New G.E.C. Motor Starters.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2, recently introduced a comprehensive range of multiple-lever contactor motor starters for use with d.c. motors of from 80 to 300 h.p., not exceeding 500 volts, and full-load currents of from 150 to 550 amperes, as starters of the face-plate pattern are not suitable for such large currents. They consist of a single-pole contactor with an overload relay for connection to the line, and a number of single-pole switches, each of which cuts out a section of the starting resistance, the number of sections depending on the capacity of the starter. Operated by a hand wheel and worm, the latter sliding along a keyed shaft, the contactor and switches are mounted on a slate panel, and the cast alloy grid resistances are mounted below the switchgear, the complete apparatus being enclosed in a steel-plate casing. When the "start" push-button is pressed, the solenoid of the line contactor is energised, and with the push button still pressed the hand wheel is turned so as to rotate the sliding worm, which engages with the heel of each of the switches and closes them one at a time. When the last switch is closed, the motor is connected to the line and the push button can be released. The "stop" button causes the line contactor to open, and it is impossible to switch on the current with any of the starting resistance short circuited, or run the motor with a portion of the resistance in circuit. The contactor automatically interrupts the motor circuit should the supply fail, and full protection is provided against overloads. Cable inlets are provided at the back of the starter.

A Screw for Hammer Drive.

The latest development of the RAWLPLUG CO. OF CANADA, Southam Buildings, Bleury Street, Montreal, is the "Drivscru," illustrated in fig. 1. By virtue of a very coarse and wide-angle thread, the screw may be knocked in instead

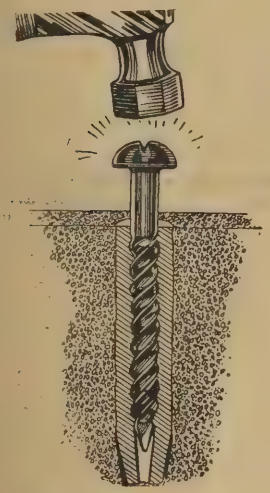

Fig. 1.—The "Drivscru."

Fig. 2.—"Quickfix" Gallery.

of turned with a screw driver in the usual manner. This device should prove an attraction to those wiremen and others, who show a preference for the hammer to the screw driver.

A New Shade Gallery.

A new gallery for electric light shades, the "Quickfix," fig. 2, which has been designed for quick operation, has recently been put on the market by MESSRS. CHARLESWORTH PEEBLES & CO., 5, Eden Street, Hampstead Road, London, N.W.1. The feature of the device is a circular steel spring, fitted with three lugs suitably shaped to fit inside the top of the globe or shade to be supported, which is fixed, at its centre, internally to a metal band composing the base of the gallery. By pressing together the ends of the spring, which are suitably finished outside the band, the diameter of the spring is reduced. The globe or shade is then put in position and the spring released, when the lugs will, it is claimed, firmly grip the shade. It is claimed that this is the only gallery on the market which grips the shade from the inside. The spring arrangement allows for the expansion and contraction of the glass, &c. The absence of tightening screws is another feature which is claimed to give this gallery superiority over the usual types.

An Automatic Current Calculator.

The LANCASHIRE DYNAMO & MOTOR CO., LTD., have sent us a sample of a limited supply of automatic current calculators which is available to those interested. The principle of the device lies in the usual desk calculator, and the attraction between two bar magnets, one fixed and one free.

Electric Rivet Heaters.

The accompanying illustration, fig. 3, shows one of two electric rivet heaters which are being produced by the AMERICAN HOIST & DERRICK CO., St. Paul, Minn., which are intended for rivet-heating work in boiler and tank shops, &c. The model illustrated is designed particularly for use on structural work and four rivets are heated simultaneously. Three contact elements are provided. The centre set is stationary and is used at both top and bottom positions. Upper and lower sets are arranged to slide up and down and are actuated by foot

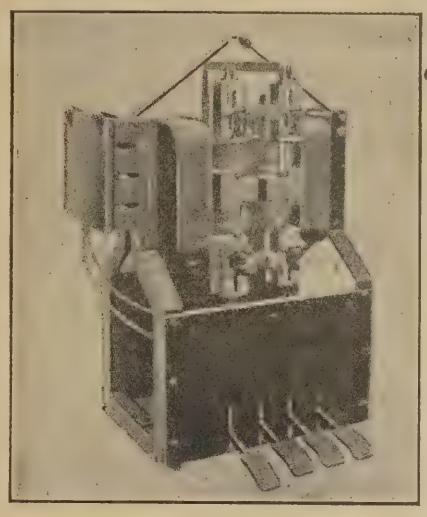

Fig. 3.—Electric Rivet-Heater.

pedals at the front. The stroke and setting of the sliding contacts permit of heating rivets up to and including 9 in. in length. The control switches are interlocked and arranged to regulate the current for varying the heating speeds and rivet sizes.

An Electric Ploughing Tractor.

We illustrate herewith, in fig. 4, an electric ploughing tractor which is marketed by ETABLISSEMENTS JOYA, Grenoble, France, and for which Mr. Paul Dieny, 20-21, Laurence Pountney Lane, London, E.C.4, is the agent in this country. The "Mototreuil" has been designed particularly for market gardeners and for vineyards. The motor and driving equipment are mounted on a two-wheel truck. A driving pulley which is belt driven from the motor is geared to a drum from which

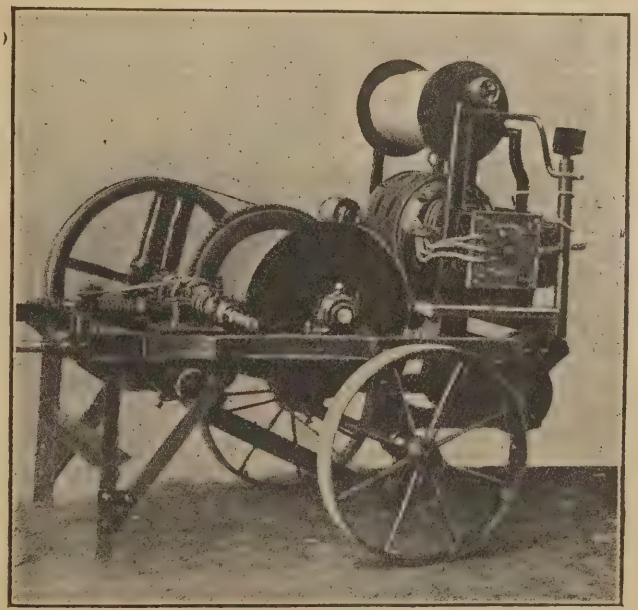

Fig. 4.—The "Mototreuil" Electric Plough Tractor.

the wheels are propelled by a chain drive. The necessary supply cable is carried on a small drum placed over the motor and is wound by means of a small hand winch. It is claimed that when ploughing with a Brabant single, 11-in. plough, making a furrow 14 in. wide, such a machine would cover one acre in seven hours. With a double plough, making two furrows, 7 in. deep on a width of 2 ft., the same area can be ploughed in four hours. Larger machines equipped with motors up to 15 h.p. can be supplied.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Concluded from page 232.*)

H. Tinsley & Co.

Among the large number of exhibits on this stand, including several forms of potentiometers and the strobometer, an improved form of Dr. Drysdale's stroboscope, the most interesting instrument seen was a Willans test set. This has been devised for testing the performance of intervalve transformers by measuring their voltage amplification in conjunction with an appropriate valve. It depends for its operation on a novel bridge arrangement whereby both the phase shift and scalar amplification are given. The anodes of two valves, the filaments of which are controlled by separate rheostats, are connected in parallel through a pair of telephones to a h.p. supply, and to the grids of the valves are applied alternating pressures from any source. If the valves have linear characteristics and identical mutual conductances, and if the grid pressures are equal and in phase opposition, then no sound will be heard in the telephones. Fig. 26 is a simplified circuit diagram of the apparatus. Valve A is followed by an intervalve transformer T, and the object of the measurement is to ascertain the vector voltage amplification of these. The anodes of valves B and B' and the primary winding of a telephone transformer P are connected in parallel. To the grid of the first valve is applied a fraction of the input pressure to a bridge of four arms, three of 1,000 ohms resistance and one in general slightly different from that value. The condenser C can be connected either across the arms 2-4 or 3-4.

The mutual conductances of the valves B and B' are rendered the same by means of connecting the grid of valve B to the point 3 on the bridge, and obtaining a balance, and by adjusting the filament resistances of these valves the sound in the receivers is made zero. By changing over the switch S_1 to the output of the pressure amplifier, and displacing the balance of the bridge until the output pressure is such that no sound is heard in the telephones, the output pressure of the transformer is made equal and opposite to the pressure across the bridge arm 2-4, and the input pressure to the amplifier equal to the pressure between points 1 and 4 on the bridge. Consequently the amplification ratio is equal and opposite to the ratio of these pressures, which may be readily calculated. An essential feature of the instrument is that there is practically no impedance either in the input grid circuit or in the output anode circuit. For the purpose of measuring voltage amplification of very small value, means are provided (not shown in illustration) for connecting the grid of B' to a tapping point in the resistance of the arm 2-4. Numerous measurements are claimed to have been carried out with this apparatus on intervalve transformers of all kinds, and results almost exactly in agreement with theory have been obtained. The analysis of a transformer is far more readily carried out by virtue of the fact that the vector ratio of amplification is yielded by the measurement, and it is possible to predict the amplification of the transformer at frequencies beyond the range of convenient measurement by extrapolation.

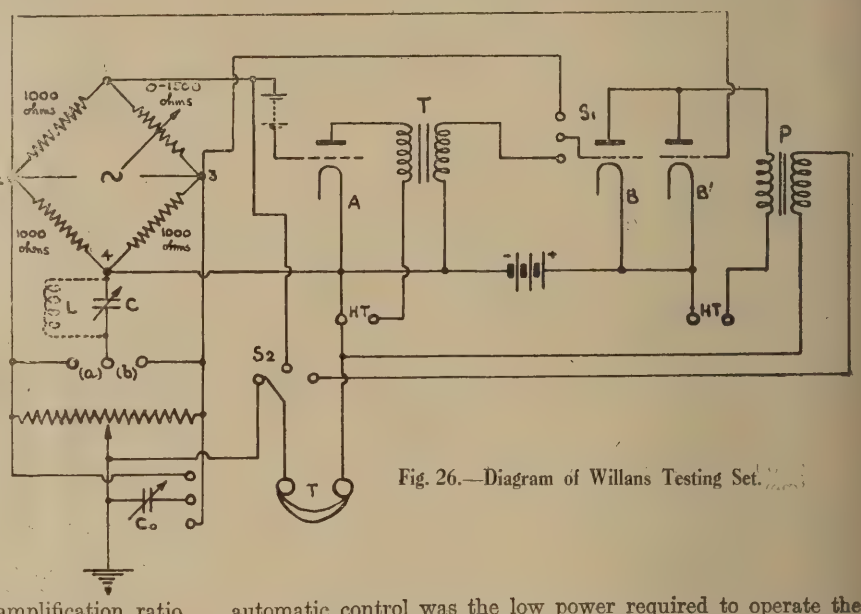

Fig. 26.—Diagram of Willans Testing Set.

Kelvin, Bottomley & Baird, Ltd.

This company had a very interesting exhibit of quartz mercury-vapour lamps, "daylight" lamps, and ultra-violet light apparatus. The mercury-vapour lamps are of the K.B.B. atmospheric type, the radiation from which is very rich in ultra-violet rays. The lamp is started without the use of tilting mechanism by means of a small heating coil surrounding a limb which projects from the arc tube; when the lamp is switched on, the arc is started by the vaporisation of mercury in this small bulb, and directly the arc is established the heating coil is automatically cut out of circuit. The lamp being atmospheric, can easily be opened for cleaning, consequently the quartz burner, apart from mechanical breakage, is practically everlasting. This type of lamp was shown with a variety of portable floor stands and other fittings with which it can be conveniently employed for therapeutic purposes, whilst the operator is protected from the ultra-violet rays by suitable means. Spun aluminium localising tubes of various shapes are provided with the lamps, and the apparatus is so designed that the light can be thrown in any required direction. The lamps are made for any d.c. pressure from 100 to 500 volts, and take a starting current of 4½ amps., the steady current being slightly under 3 amps. when the lamp is burning. The whole of these apparatus are of British make.

The K.B.B.-Macbeth artificial daylight lamps consist of ordinary clear glass incandescent lamps, the light from which is corrected by passing through a special filter which is of solid tinted glass. The filters are graded so that any desired daylight equivalent ranging from sunlight to blue skylight can be obtained, and the lamps are housed in fittings of various patterns. According to a report of tests made by the National Physical Laboratory on one of these lamps, the light exactly matched the colour of an overcast northerly sky.

Gambrell Bros., Ltd.

This firm had a large display of apparatus for general testing, comprising resistance boxes and bridges, potentiometers, galvanometers, voltmeters and ammeters, and accessories, as well as wireless apparatus and components.

A. Gallenkamp & Co., Ltd.

Electric furnaces in operation were shown at this stand as well as electro-titration apparatus and an electrically-heated thermostat bath with automatic temperature control to within one hundredth of a degree Centigrade; a special feature of the automatic control was the low power required to operate the relay, which acts with 0.2 milliamp.

Research and Experimental Section.

This section was a novel and very welcome feature, enabling a number of processes and laboratory expedients to be demonstrated. In group A, the Accoustical Section, War Office (Major W. S. Tucker), showed a sound locator for determining the position of aircraft, a camera and automatic developer for recording galvanometer deflections, and special types of the Tucker hot-wire microphone. From the Admiralty Research Laboratory, Teddington, there came a chronometer with a phonic motor drive designed to measure a time interval of the order of a few seconds with an accuracy of one-thousandth of a second for submarine sound ranging and similar measurements. Other exhibits from the same source were piezo-electric oscillographs, a neon lamp time marker, and visual leader gear.

Prof. H. L. Callendar, F.R.S., and Dr. H. Moss showed their electric air flowmeter. The Research Laboratories of the General Electric Co., Ltd., showed a great variety of ingenious devices for use in a research laboratory; specially interesting features were joints between glass and silica, with the aid of pyrex, and large glass-to-metal joints for use on valves with water-cooled anodes. Henley's Research Laboratories showed Capt. P. Dunsheath's "solid diagrams," illustrating the characteristics of cable dielectrics, and the National Physical Laboratory showed an all-steel mercury-vapour vacuum pump, an X-ray tube for crystal analysis work, a mercury-cup thermo-electric key, and a hot-wire velocity meter, as well as various physical apparatus.

In group B a striking experiment was shown by Mr. G. L. Addenbrooke, in which a column of castor oil is attracted upwards to an electrode of an excited Wimshurst machine. Mr. W. Brooks Sayers showed some magnetic effects, and Mr. F. E. Smith, F.R.S., showed a simple current weigher "designed to show how easy it is to measure current in absolute units." Mr. F. H. Glew demonstrated magnetic levitation and radio-activity.

In group C Prof. Sir William Bragg, F.R.S., showed apparatus illustrating Faraday's discovery of electro-magnetic induction in 1831, and Mr. F. E. Smith exhibited the original rotating coil used in 1862 by the British Association Committee for the measurement of a resistance in terms of the centimetre and second.

A discourse was delivered on each evening, that on January 7th relating to "Electrical Listening," by Major W. S. Tucker, D.Sc. This lecture was illustrated by a series of exceedingly interesting demonstrations of the properties of microphones, especially the Tucker hot-wire microphones used in military sound ranging. It was shown how records were obtained of sound waves from various sources, including a siren and a thunderstorm.

There is no doubt that the new departures on this occasion, including the opening of the exhibition on the third day and the demonstrations of laboratory methods, greatly increased the success and popularity of this event, which has now reached its sixteenth year. Perhaps on the next occasion care will be taken that the general public is effectively informed of the privilege extended to it on the third day; we feel sure that if this were done a very large attendance would be recorded, and the educational value of the exhibition would be greatly increased.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Government Electricity Scheme.—The Government's electricity proposals were frequently referred to in the House of Commons last week during the debate on the motion for the presentation of an address in reply to the King's Speech.

Mr. HURST, the mover of the motion, said that the House would welcome the proposed Electricity Bill, the object of which was to make the supply of electricity more abundant and more universally available in this country.

Mr. LLOYD GEORGE said that the more power we derived from electricity the more coal we saved. He welcomed the introduction of the new Bill, although the saving of coal would mean that more men would be unemployed in the coal-mining industry.

Mr. DENNIS HERBERT said that the new proposals had been received, by those competent to judge, with a considerable measure of caution, although there had been some cautious approval of them. He admitted that they could not allow private enterprise to have its own way entirely. There must be a certain amount of State regulation or co-ordination. Many members of the House sincerely hoped that the Government would be successful in the difficult task of so imposing a modified measure of Government control or Government organisation with regard to electricity, that it would prevent the danger of haphazard development by private enterprise, but would, on the other hand, avoid the blight of Government control.

Captain GUNSTON said that from a recent report he gathered that electricity could be bought in the Newcastle district considerably cheaper than in Ontario, and that should encourage us to develop our latent resources, which might do something to help the mining situation. It was very necessary, however, to educate the people of this country to the advantages of electricity.

Mr. SNOWDEN contended that an essential public service like electricity should not be permitted to be a field for the private exploitation of the public, and any scheme for the reorganisation of the electricity supply should consolidate and co-ordinate the whole of the business under public ownership.

In the House of Lords comment was also made on the scheme. Lord RAYLEIGH contended that in generating electricity, units of not less than 20,000 h.p. ought to be employed, and that necessarily involved the abandonment of all small-scale generating stations. This was one of the essentials of any real improvement in the electrical situation. The supplies of electricity must be linked up in different parts of the country by long-distance transmission lines and the whole country covered with an electrical network. The co-ordination of the electrical supply would require the standardisation of frequency all over the country, and this would be a difficult undertaking, involving, no doubt, the sacrifice of much valuable plant. Exactly how far the process could be carried was something which must be a matter of judicious compromise.

Lord HALDANE welcomed the proposed Bill, and said it was essential to have one standard of frequency. We ought to be the greatest manufacturers of electrical plant for export in the world. We had admirable electrical engineers and firms of electrical constructors, but they could not sell their products abroad as they should do because they had to manufacture for several frequencies here and another for the foreign market.

Notice has been given that the Bill will be introduced in the House of Commons, probably next week.

The Marine Wireless Dispute.—On February 4th, in reply to several questions on this dispute, Sir P. CUNLIFFE-LISTER, the President of the Board of Trade, said that he was aware that there were a number of ships that were without the services of wireless operators, and that on others there were operators who did not possess full qualifications. The question of appointing a Court of Inquiry was one for the Ministry of Labour. The action taken by the Government during the present strike was the same as that taken by previous Governments on similar occasions; it could be challenged in the Courts. The number of ships which had sailed without wireless operators since the beginning of the dispute up to the end of January was 1,187, 85 of which were passenger ships.

No ships subject to the provisions of the Merchant Shipping (Wireless Telegraphy) Act, 1919, had been reported missing since November 26th, 1925. A few such ships had been reported overdue, but they had all since arrived at their destinations.

The Severn Barrage Scheme.—On February 4th, in reply to Mr. Shaw, who asked if a report on the Severn barrage scheme had been presented by a scientific committee, Col. MOORE-BRABAZON, Parliamentary Secretary to the Ministry of Transport, said that the sub-committee of the Committee of Civil Research, who recently considered this matter, had reported to the effect that a *prima facie* case had been established for undertaking further investigations with a view to determining whether the technical difficulties of constructing a Severn barrage could be surmounted, and this recommendation had been accepted by the Government. It was not proposed to publish the report of this sub-committee, which was not a scientific committee, but when data had been accumulated he had no doubt that a report would be published.

Col. WOODCOCK asked Col. Moore-Brabazon whether he was aware that within a few miles of this proposed Severn barrage the city of Bristol was building enormous electric power stations at an initial cost of over £1,000,000. If the Government had given permission for these to be built, why should they go on with the Severn barrage scheme, which would supply the same area?

Col. MOORE-BRABAZON replied that the whole question of harnessing the tide in a country like this was very important. The possibility of the scheme from the point of view of power was in the neighbourhood of 300,000 kW.

The Factory Bill.—On February 4th, Sir W. JOYNSON-HICKS, the Home Secretary, informed Mr. Robinson that it was not proposed to proceed with the Factory Bill during the current session, but it was the intention of the Government that the Bill should be passed during the present Parliament.

Private Bills.—The following private Bills have been introduced into the House of Commons and read a first time:—The Bristol Corporation Bill, the Guildford Corporation Bill, the Hackney Borough Council Bill, the Mynyddislwyn Urban District Council Bill, and the Swindon Corporation Bill, some of the objects of which, among others, are to enable the various local authorities to make further provisions with regard to their electricity undertakings; the Lancaster Corporation Bill, the Hartlepools Corporation (Trolley Vehicles) Bill, and the Ramsbottom Urban District Council Bill, which will enable the local authorities to run trolley vehicles; the London Electric and Metropolitan District Railway Companies Bill, "to empower the London Electric and the Metropolitan District Railway Companies to execute works and the London Electric Railway Company to raise additional capital"; the London Power Company Bill, "to confer upon the London Power Company, Ltd., powers to acquire lands and to construct a generating station and other works"; the Metropolitan Electric Supply Company Bill, "to confer powers on the Metropolitan Electric Supply Company, Ltd."; and the Metropolitan Railway Bill, "to empower the Metropolitan Railway Co. to construct new railways and other works and to acquire lands."

Standards in Belgium.—The Comité Electrotechnique Belge, of Brussels, has adopted the recommendation of the International Electrotechnical Commission with regard to low-pressure standards. In future, therefore, the pressures to be regarded as standard in Belgium are as follows:—Direct: 110, 2 by 110, 4 by 110, 220, 2 by 220, and 440 V. Single phase: 100, 2 by 100, and 220 V. Three-phase: 110, 127 by 220 V (between phase and neutral point). The following table shows the high-pressure standards which have been adopted:—

1,000	volts	...	45,000 volts
2,000	,,	...	60,000 ,,
3,000	,,	...	80,000 ,,
6,000	,,	...	100,000 ,,
10,000	,,	...	150,000 ,,
15,000	,,	...	200,000 ,,
20,000	,,	...	300,000 ,,
30,000	,,		

A standard test for oils for transformers and switchgear has also been adopted.

Domestic Voltage Regulation.—Editorial remarks in the *Electrical World* make the fact apparent that domestic loads have grown so large in America that serious attention must be given both to voltage regulation and wiring in homes. The houses are becoming miniature machine shops with a variety of motors and heating devices which are bound to cause voltage fluctuations if the wiring does no more than comply with the formal underwriters' regulations. Some appliances, such as electric refrigerators, automatic pumps, ventilating motors, and oil-burner motors, have no respect for time, or load, and may start at the peak period, or at night when all lamps are burning. These voltage fluctuations are annoying because of their effect on the light, and they may become more so as relays and controls are developed and used for household applications. The supply authority may enlarge transformers and secondary distribution copper, and yet not improve the situation materially. "The answer to the problem lies in the development of some kind of house voltage regulator. All electrical men who study this situation will admit its serious character, for even now it is affecting the development of domestic load."

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Institution of Electrical Engineers.

It is understood that one of the rules governing admission to the Institution as an Associate Member is that the candidate must have held a superior position in one or other of the branches of electrical engineering for a period of not less than five years. A foreman, for instance, would not be eligible as an Associate Member no matter what degree of knowledge or skill he possessed. On the other hand, an individual with comparatively no electrical knowledge, but having sufficient cash to carry on an electrical business for a period of five years (with other people's brains), would be eligible. The foregoing is my interpretation of the rule referred to, but, of course, I may be in error. Previous to my obtaining particulars regarding the matter in question, I had always been under the impression that superior knowledge weighed more with the I.E.E. than superior position, but my impression has been in error. With all due respect of the Institution, I would suggest that they delete the word "position" and substitute for it "knowledge or skill." By this alteration an unfair and autocratic rule would be corrected.

Non-Member.

January 30th, 1926.

Electrical Showrooms.

The recent article by Mr. W. A. Gillott, A.M.I.E.E., and the letter of Miss Ethel Prentice will, I am sure, show a large number of readers the absolute necessity of electrical showrooms, if the general public is to get a sound idea as to the innumerable uses electricity can be put to for domestic purposes.

Being greatly interested in publicity matter for promoting the further use of electricity in the home, I quite agree that the value of a showroom has been sadly neglected. Every person who wishes to have electricity installed in his home is by no means an electrical engineer. It therefore remains to provide a scheme whereby this person can see with what simplicity domestic appliances can be operated. If given proper consideration, the best, and probably the only, scheme of any real value is a suitably-equipped showroom.

In the lay-out of a showroom, great thought, care, and time should be given to what exactly is required, and lighting schemes must be carefully planned. It is not a bit of use doing the thing haphazard—this will mean failure to attain the object aimed at. Each domestic appliance should be fitted in position with care, and every facility for the easy operation of any appliance should be provided.

The staff engaged in a showroom should be alert, and smart in appearance, and have a thorough knowledge and be able to give quick information on any points relating to the appliances shown, which a particular client may ask for. If possible, arrangements should be made so that practical demonstrations could be given with cooking appliances, &c., taking into consideration that the person chiefly interested in domestic appliances is the housewife; she is the person whose interest should be obtained, and to secure this interest a showroom would form a very good magnet, inasmuch as she would be able to see personally with what simplicity these appliances can be operated.

Further advertising matter would be an advantage. An illustrated booklet, leaflets, &c., dealing with the different domestic appliances, giving estimates of cost, and any further details which would be of service to the prospective purchaser, should be provided.

Mr. Gillott says in his article: "What of the contractor?" I will ask the question: "Is every contractor in a position to have a showroom?" Possibly not!—then, in my opinion, the supply authority in his district should have a well-equipped showroom; this could be a help to him instead of a hindrance. In any case, I hope that those who think not will take the offer made by Mr. Gillott in his article, and let us try to bring the full benefits that electricity can provide to the attention of the public.

A properly-organised and suitably-equipped showroom is undoubtedly one of the best forms of advertising. Now is the time, when electricity is coming so much to the fore, when the question of showrooms should receive the attention it rightly deserves.

R. Williams.

Birmingham, *February 1st*, 1926.

A National Electrical Convention.

In the Electrical Review of January 29th, you invite expressions of opinion from those interested in Mr. S. T. Allen's proposals for the holding of a National Electrical Convention.

It seems to me that the outstanding value of such a function would be its educational value to the lay mind—both men and women—all of whom are potential users of electrical energy in one form or another.

We all realise that what is known as the electrical industry is too remote from the potential customer, who sees most of its difficulties in initiation and little of its tremendous mission as a distributor of comfort and of service, and as a great saver of time.

Further, the public needs to be educated on the question of, and reasons for, the cost of electricity, and to get rid of the idea that some malevolent engineer in the background is deliberately preventing its extension on lines which would bring its use to the door of everybody.

Part of the value of such a conference would be that a question of first-rate importance, such as the need for a better selling organisation, and more practical methods for presenting the electrical idea to the public, would be considered, and the best methods applied to this problem, as foreshadowed by the Prime Minister the other day.

Not one, but all, sections of the industry are vitally concerned in this aspect of our ever-growing needs.

In this connection may I again emphasise a suggestion which has found favour in a number of quarters—that the supply undertakings should train and employ a body of educated women who would eventually understand the general economic difficulties of the industry and be able to impart an understanding of electrical apparatus and methods in the home, in a way that every intelligent housewife can appreciate and understand. Such a liaison between the undertakings and the home consumer would do much to popularise the use of electricity.

Women demonstrators have done and are doing magnificent work, and a greater extension of their calling would do much to make electricity the national servant it is surely capable of being.

Such a conference as is projected, if it could discuss homely topics, as well as the wider questions involved in the industry, would, I am sure, be of the greatest benefit to all concerned.

With all the brains and organising ability possessed by the industry it seems to me that there is no difficulty whatever in the way of arranging a conference such as that outlined by Mr. S. T. Allen.

Caroline Haslett,
Director, Electrical Association for Women.

London, *February 1st*, 1926.

The Government Electricity Scheme.

It is already evident that opinions regarding the above scheme are by no means unanimous, and, further, are not likely to be.

It is evident that a great deal of adverse criticism is based on thoroughly sound reason, but, on the other hand, it is at least reasonable to assume that those responsible for drawing up the scheme found very good ground for arriving at their conclusion that it is financially and economically sound.

If we take these two views as extremes, perhaps the solution lies at a point between them.

We are told that the grid system is to materialise only gradually, and this in itself is sound, but financial soundness seems to me to hinge entirely on the method of growth adopted. It has been suggested that each J.E.A. should be left to develop its own already delimited district. I would suggest a combination of the two ideas.

Again, assuming that the Government has in view a more or less definite idea as to what the final realised plans are to look like, this plan should be published in full. Those parts of the scheme to be first dealt with, which are no doubt concerned with the more densely inhabited areas and where the minimum expenditure on interconnecting mains will bring the maximum benefits, could then be embarked upon. The J.E. Authorities of the remaining areas working with the ultimate plan in their minds could then each be left to develop its district, modelling its mains layout so that eventually with a minimum of further expense its system could be interconnected with adjoining systems.

It seems reasonable to imagine that much good preliminary work could thus be done by those independent authorities who would of course be guided by the Electricity Commissioners in the same way as at present, only with more authority as to the design of the feeder systems. It is the common experience in designing distribution systems that what might appear to be for the best at the moment is not by any means ideal if reasonable future developments are taken into account, and the same might apply to feeders if the "grand vision" is allowed to exert its influence. It is likely that in very many instances such a policy would alter the route of "backbone" feeders. It might conceivably also alter in some cases the class of feeder laid down, and incidentally influence the promiscuous tapping, the point of tapping, and the layout of sub-stations. Many more effects of such a policy will readily suggest themselves, especially to those dealing with larger districts, where the policy would be most applicable.

In any case, it is axiomatic that work done to a plan will mean greater efficiency than will haphazard procedure, and I see no reason why the electricity supply layout of this country should prove an exception.

Sevenoaks, *February 1st*, 1926. **C. F. Mounsdon.**

I was indeed interested in Mr. C. Culmer Hodges's letter in your current issue; so much so that I was constrained to turn up particulars of his station in "Garcke."

I feel that this is a most striking instance of a system which would be greatly benefited by the introduction of the Govern-

nent scheme. Here is an extremely small station (total plant apacity, 180 kW) which sells its electricity at 9d. per unit or lighting, 3d. for power, and 1½d. for cooking; the bulk of ts load is lighting, its revenue being 7.39d., while its work- ng costs were 5.46d., per unit sold, in the year 1924. Mr. Hodges states that a bulk supply would cost 3d. per unit: why ot, then, sell at an average figure of 4.93d. per unit? This vould enable electricity to be sold at the following prices:— d. per unit for lighting, 2d. for power, 1d. for cooking, while till maintaining the same gross profit of 1.93d. per unit. Surely these are better than the present charges; and would hey not most certainly encourage an increased use of elec- ricity? If one assumes that all the electricity at present sold ould be sold on the Dundee Tariff at the same total price including the fixed charge of 8s. per 100 sq. ft.), then the ixed charge works out at 5.89d. per unit sold. If, then, a ulk supply was taken and the same fixed charge maintained, he electricity could be *given away*, and a magnificent profit vould still be made!

It would seem that the small outlying town has much to ain by "Government" electricity.

H. J. Allcock.

Manchester, *February 1st*, 1926.

Let Your Boy Benefit by Your Experience!

The boy who, ambitious to become an engineer, has an ngineer for his father, ought to be a happy boy. The father ught to be a proud father. Too often the father imagines imself a disillusioned man. The pet theme of many such athers is that they know too much to wish their sons to ollow in father's footsteps. So among engineers (as, indeed, n almost every other walk of life) there is a prejudice against ames, junior, following the lead of James, senior.

So far as engineering is concerned—and many other trades r professions also—this is a grave mistake. The father knows, r he should know, the various ropes. Especially if he be self-made man, he will be in excellent case to give his son better start off than he was himself blessed with. Much of he blundering in a youth's career is due to his lack of direction. here are many who could *put him wise;* but, unfortunately, e does not know them, nor they him. But in the case postu- ated, Father knows—again, lucky son! The father can guide he son's career; often he can put a good word in for him ith the people who can turn the wheels. Not infrequently good workman, well in favour with foreman and manager, s able to get a son admirably placed—placed on an equality, s regards opportunity, with the best. Then it is up to the on to make good midst really favourable conditions for aking good. Such a father, helping such a son, forgets his wn disappointments if only his son wins his spurs. Such son, being assisted by such a father, if he succeed, should e happy—not least of all because his father—no great success imself—helped him, the son, to rise. No matter how great is fame may be, the son's triumph will be his father's also.

W. Roland Needham.

Goodmayes.

The Metering of Three-phase Power.

I must thank "A Meter Superintendent" for his correction f my statement concerning the limits of accuracy of a two- lement three-phase meter. The points which he mentioned ere missed by me, as I had it firmly fixed in my mind that he subject under discussion was the metering of *three-phase* ower and not the metering of other phenomenal circuits.

I feel sure that if your correspondent will keep that fact in is mind he will find that the conditions which I mentioned s being necessary for correct registration with a two-element hree-phase four-wire meter are correctly stated.

It is, of course, quite easy to point out that an unequal oltage may be compensated by varying the angle between he phases; but such things do not usually happen in practice nd, therefore, do not enter into this discussion.

If your correspondent will take my three conditions and ead them one by one and treat each one separately, I think e will have no difficulty in finding them accurately stated.

H. Hugh Jaques.

London, *February 1st*, 1926.

Fraudulent Trading.

The radio industry to-day seems to be the happy hunting- round for all business crooks and fraudulent traders. We, n common with many of our friends in the industry, have uffered extensively from these rogues, and we consider that ; is high time the whole of the trade got together, and made supreme effort to get the industry cleared of this parasite.

If all manufacturers in the industry got together—preferably nrough a trade association—it would be quite a simple and peedy matter to do this.

The methods of these fraudulent traders are, in all cases, lmost identical—they start off as dealers in the radio industry, nd are able by some means to furnish references, and offer o pay cash on delivery for goods. This arrangement is kept p for a short time, and then the manufacturer is informed iat owing to large accounts outstanding, &c., they will be lad to have a monthly account, which is also paid promptly or a short time. Then a large order is sent—amounting to undreds of pounds in some cases—and payment is not made. writ is issued, but in the meantime a new company is ormed and the manufacturer is told by his solicitor that the old company has no assets and execution cannot be made. The new company carries on business in the same premises and with exactly the same stock and carries on, presumably, a fresh course of robbery from other manufacturers.

We know of several conscientious, honest manufacturers, in a small way of business, who have been absolutely ruined through these transactions.

We consider that a means of stopping this sort of business would be for the radio manufacturers to form a small association, paying a subscription according to their turnover, and employ a first-class solicitor to take these matters up, however small the amount, and fight the case through to a finish, because if these fraudulent traders can get off scot free with a small amount, the next time the amount will be larger and so on, until very substantial sums are involved, whereas if they are stopped with the small sums, it is highly probable that the matter would end there, and they would be forced out of the trade.

We have a case now of our own in which approximately £300 is involved—a case of absolute fraud—and we intend, whatever it costs, to fight the matter through. Unfortunately it will undoubtedly be an expensive matter, as the law seems to be so loose with these rogues, and for a time they simply laugh at it; but they all make slips, and can generally be brought to book if the matter is pushed to the end.

We are quite sure that if the whole trade got together and pooled its information and notified all such cases, this fraudulent trading could be stopped, and it is high time that some action was taken in the matter.

There is another form of trading which we consider also comes within the category of fraud; a so-called wholesaler sends an inquiry to a manufacturer for a large quantity of goods. He is quoted the usual wholesale factors' discount, and he replies stating that he has to sell to factors, and in view of the quantity he is prepared to order, can he have a special discount? In some cases the quantity required warrants an extra discount, and this is given by the manufacturer. The wholesaler then takes about one-third of the quantity ordered and asks the manufacturer to hold up delivery, as sales have been slow and he has a fair stock, and the balance of the order is never taken. We also have one or two cases on our books of this description, and we intend to fight these cases also. We demand that either the balance of the order be taken, or that the wholesaler shall pay the difference between the ordinary wholesale factors' discount and the extra discount allowed him for the special large quantity ordered.

It would be interesting to hear the experiences of other manufacturers on this question.

For and on behalf of **S. A. Lamplugh, Ltd.**
J. Stanley Spittle, *Managing Director.*

Birmingham, *February 5th*, 1926.

Laundering—As Others See It.

Commenting upon the Government's electricity scheme, "The Power Laundry" points out that "cheap electrical power will mean the wider adoption of the electric drive, and, so far as possible, individual drives for all the large [laundry] machines. . . . This should lead to a substantial cheapening in laundry costs. The use of the electric van for laundry work should also receive a great stimulus. Laundries will be cleaner, brighter and healthier. There is, however, another side to the matter, which is not quite so rosy. The universal distribution of cheap current to every household and the rapidly growing familiarity with its practical use may, and probably will, lead to the production of electrically-driven home washers on a considerable scale. With an electrically-driven washer, an electric iron, and an electrically-heated drying cupboard, the housewife will be tempted to do her work at home rather than send it to the laundry. As a matter of fact, this is what has actually taken place in the United States of America." This candid comment lends added interest to your editorials and articles on electric washers and home-laundry machinery (Elec. Rev., December 18th, *et seq.*), the potentialities of which, from the load-building viewpoint, do not appear to be generally appreciated.

N. L. W. E.

January 30th, 1926.

The All-Electric House.

I think your contributor, Mr. E. W. Dickinson, has a delightful sense of humour in describing himself as an "electrical enthusiast" at the end of his most useful piece of propaganda for the gas people.

But it was cruel of you not to tell him that the things he finds economically impossible are being done, almost at his doorstep as well as in many other parts of the kingdom; and that it was discovered long ago that his figures are only part of the story.

Those of us who have been using not only electric cooking but an all-electric house for years, know that we cannot get a similar service any cheaper with gas. Even if we could, we would rather go with a little less service than go back to such a wretched substitute, should severe financial stress make the saving of a penny or twopence a day a vital necessity.

If enthusiasm for electricity induces Mr. Dickinson to advocate the use of gas, I am longing to see him write on something that leaves him cold!

Ernest E. Sharp.

London, *February 6th*, 1926.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 3rd. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Globar (lettering and design). No. 458,440. Class 4. Carbons and carbon compounds for electrical purposes.—American Resistor Co., Milwaukee, Wis., U.S.A. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

Encore. No. 456,530. Class 8. Instruments and apparatus for use in radio-telephony and telegraphy.—F. W. West and H. W. Jackson, 16, Lower Richmond Road, S.W.15.

Fairy. No. 460,823. Class 8. Thermionic valves.—Louis Kremner, 49a, Shudehill, Manchester.

Stiradio. No. 457,644. Class 8. High- and low-frequency transformers, loud speakers, crystal and valve receiving sets, detector crystals, headphones, variometers, variable and fixed electrical condensers, electric batteries and accumulators, thermionic valves, induction coils, &c., all for use in radio-telephony.—Stirlings, Ltd., 17, Clarence Street, Kingston-on-Thames.

Zenith. No. 461,778. Class 8. Electrical resistances, potentiometers, rheostats, transformers, and rectifiers for accumulator charging and for other purposes.—R. Lehmann & Co., Ltd., Villiers Road, Willesden Green, N.W.2.

Microstat. No. 462,535. Class 8. Variable electrical resistances.—H. A. Yoward, trading as the Lifford Engineering Co., Lifford Lane, Kings Norton, Birmingham.

Radialities. No. 462,751. Class 8. Radio-telephonic and telegraphic receiving and transmitting apparatus.—Partridge's, Ltd., 118, Northwood Street, Birmingham.

Radiolys. No. 462,827. Class 8. Apparatus for use in radio-telegraphy and telephony, but not including receiving sets or loud speakers.—P. Danon, 80, Boulevard Haussmann, Paris. (Perowne & Co., 7, Great James Street, Bedford Row, W.C.1.)

Dikast Cleartron, CT. (lettering and design). No. 465,353. Class 8. Electric condensers.—Clearton Radio, Ltd., 1, Charing Cross, S.W.1.

Warmoto. No. 465,445. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—F. A. Hughes & Co., Ltd., 204-206, Great Portland Street, W.1.

Tonatron, No. 465,532, and Sonatron, No. 465,533. Class 8. Philosophical and scientific instruments.—E. A. Graham, trading as Alfred Graham and Co.

Ardar. No. 465,720. Class 8. Electron discharging tubes for radio and wired telegraphy and telephony, X-ray tubes, and rectifying tubes.—Mullard Radio Valve Co., Ltd.

Day-Fan (lettering and design). No. 464,829. Class 8. Radio transmitting and receiving apparatus and parts thereof.—Dayton Fan and Motor Co., Dayton, O., U.S.A. (White, Langner, Stevens & Parry, Jessel Chambers, 88-89, Chancery Lane, W.C.2.)

Igranic Pacent, No. 465,320, and Igrametric, No. 465,342. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—Igranic Electric Co., Ltd.

Neutron. No. 465,321. All goods in Class 8, except detector crystals for radio-telephony.—Neutron, Ltd.

Serenada (lettering and design). No. 462,578. Class 8. Loud speakers for use in radio-telephony.—Serenada Manufacturing Co., Ltd., 22, Paper Street, E.C.1.

Unipower. No. 463,993. Class 8. Electric accumulators and electrolytic rectifiers.—Radio Accessories, Ltd.

MH (lettering and design). No. 464,225. Class 8. Instruments and apparatus and parts thereof for use in radio-telephony and telegraphy.—L. McMichael, Ltd.

Neutroform. No. 464,753. Class 8. Component parts of radio-telephonic apparatus.—De Leeuw & Co., Ltd., Sentinel House, Southampton Row, W.C.1.

Lissenoleon. No. 465,734. All goods in Class 8.—Lissen, Ltd., Friars Lane, Richmond, S.W.

Arrolite (lettering and design). No. 464,677. Class 13. Electric incandescent lamps (ordinary).—Maybrook Electrical Co., Ltd., 15-16, White Cross Place, Wilson Street, E.C.2.

Typerlite. No. 465,437. Class 13. Electric lighting fittings.—Electricity Services, Ltd., 27, Martin Lane, Cannon Street, E.C.4.

Angelus Firefly. No. 461,629. Class 18. Electric heating and cooking apparatus.—Charles Joyner & Co., Ltd., Icknield Square, Birmingham.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

17,071. "Electric reciprocating motors." J. A. Traylor. July 16th, 1923. (219,321.)

19,278. "Telephone transmitters and receivers and the like." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). August 14th, 1924. (245,810.)

24,262. "Wireless transmitters." N. E. Davis and W. T. Ditcham. October 13th, 1924. (245,829.)

24,381. "Wireless telephone receiving systems." P. W. Willans. October 14th, 1924. (245,839.)

24,487. "Electric heating devices." British Thomson-Houston Co., Ltd., and F. W. Leevers. July 15th, 1925. (245,846.)

24,706. "Electrical discharge devices for use as translating apparatus." Westinghouse Brake & Saxby Signal Co., Ltd. October 19th, 1923. (223,589.)

24,717. "Means for eliminating disturbances at the ends of submarine telegraph cables." W. Estaugh. October 17th, 1924. (245,853.)

24,728. "Automatic or semi-automatic telephone systems." Automatic Telephone Manufacturing Co., Ltd., and W. O. Passmore. October 17th, 1924. (Addition to 230,006.) (245,854.)

24,774. "Electric switches, and the manufacture thereof." J. A. Crabtree. October 18th, 1924. (245,855.)

25,362. "Crystal detectors for wireless receiving sets." H. T. Brooker and L. E. Williams. October 24th, 1924. (245,870.)

25,492. "Electrodes for obtaining therapeutic rays from an arc for medical and other purposes." W. G. Moore. October 27th, 1924. (245,872.)

25,553. "Variable resistances." Dubilier Condenser Co., Ltd. (formerly Dubilier Condenser Co. (1921), Ltd.). (H. R. van Deventer). October 27th, 1924. (245,874.)

25,889. "Starting equipment for electric current converters." T. W. Ross, R. Townend, and Metropolitan-Vickers Electrical Co., Ltd. October 30th, 1924. (245,876.)

25,892. "Poles for magnets or solenoids." A. West & Co., Ltd., and R. P. Bossom. October 30th, 1924. (245,877.)

25,898. "Holders for interchangeable electrical devices, such as thermionic valves, for use in wireless telegraphy and telephony." S. J. Levi. October 30th, 1924. (245,878.)

25,984. "Aerial wire." F. Ritter. July 29th, 1924. (237,855.)

28,151. "Power actuators or servo motors." C. S. Bragg and V. W. Kliesrath. December 22nd, 1923. (226,514.)

28,360. "Control systems for electrically-driven vehicles." W. Gilbert, P. A. H. Mossay, and Ransomes, Sims & Jefferies, Ltd. November 26th, 1924. (245,892.)

28,363. "Electric controllers for hoists." Electro-Mechanical Brake Co., Ltd., and M. J. Pattison. November 26th, 1924. (245,894.)

28,500. "Combined thermionic valve holders and filament rheostats for the construction of wireless apparatus." H. Bailey. November 28th, 1924. (245,895.)

28,655. "Transformers and choking coils, especially for use in radio communication." Lissen, Ltd., and R. P. Richardson. November 29th, 1924. (245,898.)

28,877. "Device for winding spools, bobbins, coils, or the like with insulated wire." O. Steed and C. J. Robertson. December 2nd, 1924. (245,899.)

30,161. "Electric welding apparatus." W. R. Hume. December 15th, 1924. (245,911.)

30,204. "Device for supporting electric light or like shades." Wilkins and Wright, Ltd., and J. H. Hewitt. December 16th, 1924. (245,913.)

30,390. "Galvanic batteries." Oldham & Son, Ltd., and W. D. Wilde. December 17th, 1924. (245,916.)

30,483. "Control arrangements of the moving parts of wireless telegraph and telephone apparatus." W. H. Powell. December 18th, 1924. (245,919.)

30,493. "Starters for electric motors." Igranic Electric Co., Ltd., and C. F. Tubbs. December 18th, 1924. (245,920.)

30,784. "Means for indicating when an accumulator is charged." L. Barrett. December 22nd, 1924. (245,922.)

30,926. "Head-lights for motor-cars, motor-cycles, and the like." W. M. Gossip and R. G. Gossip. December 24th, 1924. (245,925.)

31,241. "Plugs and sockets for inductance coils and the like." Lissen, Ltd., and R. P. Richardson. December 30th, 1924. (245,926.)

1925.

545. "Bonding or securing arrangements for electric conductors." Callender's Cable & Construction Co., Ltd., and E. Warbrick. January 8th, 1925. (245,931.)

597. "Fuse carriers." E. W. Jackson. January 8th, 1925. (245,932.)

1,057. "Trip or release mechanisms for electric circuit breakers and like apparatus." G. Ellison. January 13th, 1925. (245,936.)

2,429. "Dry cells." Mannesmann-Motoren-Werke. March 24th, 1924. (231,135.)

2,441. "Electrically-driven rotary printing presses and like machines." O. Y. Imray (Bergmann Electricitäts-Werke Akt.-Ges.). January 27th, 1925. (245,947.)

2,459. "Head-lamps for motor road vehicles and the like." H. C. Rushton. January 28th, 1925. (245,948.)

2,816. "Holders for valves, coils, and the like of wireless apparatus." C. H. Rombach and F. Brown. January 31st, 1925. (245,950.)

3,504. "Electric frequency changers." British Thomson-Houston Co., Ltd. February 9th, 1924. (228,938.)

4,250. "Unit for eliminating local disturbances in wireless reception." A. E. R. Trotman. February 16th, 1925. (245,953.)

4,579. "Aerials and lead-in wires for radio-telephony." E. Hales. February 19th, 1925. (245,955.)

5,635. "Projecting apparatus for illuminated signs." A. R. Meissner and H. H. Byrne. March 2nd, 1925. (245,963.)

8,919. "Inductance devices such as transformers or repeating coils for telephone circuits." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). April 3rd, 1925. (245,981.)

9,586. "Diaphragms for sound-reproducing instruments." J. W. Phillips. April 9th, 1925. (245,982.)

10,299. "Transformer couplings suitable for radio systems and the like." Marconi's Wireless Telegraph Co., Ltd. April 19th, 1924. (232,640.)

10,460. "Magnetic materials." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). April 22nd, 1925. (245,986.)

10,574. "Emergency braking system for electric vehicles." Machinenfabrik Oerlikon and P. Altorfer. April 22nd, 1925. (Addition to 231,905.) (245,987.)

10,664. "Retainers for electric lamp sockets and the like." F. C. Lee and G. S. Peckham. April 24th, 1924. (245,989.)

11,365. "Alarm fuses." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.) and H. J. Gowring. May 1st, 1925. (245,994.)

11,925. "Electrical resistance units such as rheostats and other conducting coils." G. H. Whittingham. July 12th, 1924. (236,898.)

12,225. "Electrical instruments for medical treatment." Y. Noishiki. May 11th, 1925. (245,997.)

13,183. "Apparatus for winding a wire in the form of a figure 8 on two parallel pins." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. May 21st, 1924. (234,487.)

14,152. "Micrometer movement device for use with variable electrical apparatus." L. E. Fillmore and L. W. Fillmore. May 29th, 1925. (246,009.)

15,314. "Electric commutators or ignition distributors." A. Tauber. June 12th, 1925. (246,018.)

15,401. "Electrodes for electric arc furnaces." International General Electric Co., Ltd. June 14th, 1924. (235,596.)

15,422. "Electric heaters for waving or curling the hair." E. F. Suter. June 13th, 1925. (246,021.)

15,595. "Electric power systems." British Thomson-Houston Co., Ltd. (General Electric Co.). June 16th, 1925. (246,024.)

15,739. "Manufacture of very thin wires." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. June 18th, 1924. (235,893.)

16,777. "Electric discharge tubes." Namlooze Vennootschap Philips' Gloeilampenfabrieken. November 17th, 1924. (Addition to 235,141.) (242,946.)

17,893. "Electron-discharge apparatus." American Appliance Co. and C. G. Smith. July 13th, 1925. (246,036.)

18,467. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. July 19th, 1924. (237,285.)

18,591. "Synchronising of alternating electric current systems." International General Electric Co., Ltd. August 6th, 1924. (238,206.)

18,963. "Variable electrical condensers." A. H. Midgley. July 25th, 1925. (246,043.)

22,531. "Electric speed indicators." British Thomson-Houston Co., Ltd. (General Electric Co.). September 9th, 1925. (246,063.)

24,129. "Thermionic amplifying systems." British Thomson-Houston Co., Ltd. September 27th, 1924. (Addition to 238,550.) (240,488.)

25,067. "Electric arc lamps." E. Steinberg. March 24th, 1925. (Divided application on 7,895/25.) (246,073.)

27,296. "Process and machine for the manufacture of incandescent lamps, thermionic valves, and like apparatus." General Electric Co., Ltd. October 31st, 1924. (242,303.)

27,303. "U-tube manometers." British Thomson-Houston Co., Ltd. November 8th, 1924. (242,634.)

28,036. "Electrical conductor or filament." Dubilier Condenser Co. (1925), Ltd. November 7th, 1924. (242,661.)

29,247. "Radiogoniometers." E. Bellini. November 20th, 1924. (243,372.)

Board of Education Examinations.—The Board of Education has issued the time table for the science scholarship examination and the examinations for Whitworth scholarships. The examinations will be held on April 28th to 30th and May 1st to 8th at times between 6 and 10 p.m.

The

Electrical Review

VOL. XCVIII. FEBRUARY 19, 1926. No. 2,517.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Electrical Travellers.

THROUGHOUT the country there are thousands of men who seldom come before the footlights of our great electrical theatre of operations, yet who in the aggregate handle an enormous volume of orders for electrical goods and thereby contribute an essential service in keeping British electrical factories employed.

It may be that in so far as they compete with each other, they do not add materially to the amount of employment that would exist without them, though we must recognise that "live" men may impart a spirit of enterprise to the retailer which may stimulate public demand and increase the general turnover. In so far as British travellers are able successfully to compete with travellers representing imported goods, however, they have the satisfaction of knowing that every order that they secure in this class makes additional work for British workmen and workwomen.

We wish to pay them this tribute, as in these days of many organisations of larger and higher-sounding purpose, they are likely to be overlooked, because they are part of the merchandising detail—the commercial detail—which receives a little less attention than it deserves.

We are not sure that sufficient regard is paid even to the scattered host of men who are travelling in the Colonies and in foreign fields. We see the statistical returns showing a satisfactory total of exports of this or that class of electrical products, forgetting perhaps that everywhere—or shall we be moderate and say, in many places?—behind this business there are, in addition to the normal sources of trade, men who travel to and fro, sometimes amid many discouragements, seeking orders which shall make work in the Homeland.

We desire to direct attention specially to this purely trade topic of the electrical traveller at the present moment, in order to excite a sympathetic interest among the trade generally in the Electrical Trades Commercial

Travellers' Association, which is just one year old. We described and discussed its objects at the time of its formation, and we are glad that it has made excellent progress in so brief a period. That there is ample room for it in the chain of links of electrical trade organisation was abundantly proved by the success which attended its annual dinner on Saturday last.

A little detail that no doubt will right itself in time is the name of the body. Mr. Joyce, the popular chairman, in his speech gave two abbreviated forms—one the "Etceteras," and the other the Electrical Travellers' Association, which is more concisely descriptive. After all, travellers are still travellers however much we may desire to call them salesmen, and their operations salesmanship. With reference to the objects of the Association, they include benevolence, mutual assistance, and fraternisation. In the main the intention is to bring the travelling members of the electrical trade together and to keep them together so that they may act unitedly in regard to matters of common interest which lend themselves to associated action. Anybody who knows anything about the manifold problems that agitate the minds of such men will appreciate at once how many things there are upon which they can usefully and profitably confer if they have an organisation large and representative enough. This being so, we wish to offer our commendation in support of the movement and to urge upon trade travellers everywhere the desirability of accepting the Association's hearty invitation to them to make application for membership. Companies and firms which may have had an inclination to shake their heads doubtfully regarding the desirability of such a movement have, we understand, no misgivings to-day—indeed, some of those who are most prominently associated with it represent such concerns. The Association is not in any way a trade union, but our own experience in the editorial chair has brought before us scores of matters typical of the difficulties and anxieties of the electrical traveller both at home and abroad, many of them questions which inquirers could place before such an Association as a matter of course and receive guidance upon; topics quite distinct in character from those which occupy the mind of the trade unionist.

We have long regarded the Trade Press and the Trade Traveller as having a very similar or co-operative duty to perform. Both are designed to link up the seller and the buyer. The description or announcement in the Press of some new manufacture prepares the way for the visit of the traveller when he calls, with samples, for inquiries or orders. It is of value to him that his potential customers know in advance what he has to offer. The Trade journal is also of interest to him in keeping him informed of the new articles that others are introducing and in acquainting him with any trend of development which should be taken into account in pushing his own sales.

We repeat that, as an essential part of the body of men who are responsible for actual electrical trading operations, we wish the Association further success.

Women and Electricity Supply.

It was some years ago that we first heard the usefulness of women urged by electricity supply engineers at the meetings of the Municipal Electrical Association. Here and there they were working very successfully as canvassers by reason of their knowledge of the ways and desires of their sex in the household. Since then they have justified their appointments in many places, whether as visiting employés persuading and convincing as to the value of domestic electrical service, and helping the consumer over the initial difficulties of an installation, or whether dealing with the public in large crowds at exhibitions. We do not know their number—it would be interesting to know it—but it is considerable. There are some outstanding examples where striking personality has been accompanied by absolute conviction and ability to express oneself; women of such a type after a time become so efficient that their proper sphere is the tuition of assistants who will profit by the optimism and atmosphere of the department and become like their instructress and be ready to carry on the good work by themselves. It has been suggested that the big electricity supply authorities should lay themselves out systematically for this class of staff development; some of them are not unmindful of the service that women assistants can render, but whether we think of companies or municipalities, we wish once again to put in a good word for women, for they have natural gifts and aptitudes which we mere men do not possess, and they have a way of booking a consumer whose eye we should never catch. Yet there are, admittedly, some ladies who would prefer to talk to a man—even about electricity!

Electricity Supply Statistics.

The volume of statistical returns with regard to electricity supply undertakings, which was issued by the Electricity Commissioners in June last year, which we have described as a vast store of information, related to the years 1920-1923; its compilation must have involved an immense amount of labour, and the care and accuracy with which the work was done reflected the greatest credit on the staff of the Commission.

But events march quickly in the electrical world, and many changes take place in the course of a few years. The Commissioners intimated, when the Return was published, that they were considering the issue of supplementary returns for 1923-24 and 1924-25, and would afterwards publish annual returns. The volume already issued brought the record for municipalities up to March or May, 1923, and for companies up to the end of 1922. The whole industry is awaiting the issue of the National Electricity Supply Bill with keen interest; its provisions will be based upon recent data, and we suggest that the publication of those particulars for the years 1923-25 is a matter of urgent importance. The whole of the material for that purpose must now be in the hands of the Electricity Commissioners, and we hope that the work of preparing it for publication is far advanced; the difficulties inevitably met with in the production of the first volume having been successfully overcome, the path of the supplementary return will be much smoother, and its early issue will be heartily welcomed by the profession.

At the annual dinner of the North-Western Centre of the Institution of Electrical Engineers the President, Mr. R. A. Chattock, expressed the strong conviction that the details of the calculations upon which the Cabinet's advisers founded their conclusions ought to be made public, so that electrical engineers could form their own opinions as to the merits of the Government proposals. With this contention we cordially agree. Not only should the estimates of cost be disclosed, with regard to the high-pressure grid, the standardisation of plant, and the administration of the scheme, but also the data which led to the conclusion that the interconnection of the various districts would bring about material improvement in the general load factor, which is largely relied upon to pay the cost of the scheme and to cheapen the supply of electricity. The cost of reducing the number of frequencies in use to the uniform value of 50 cycles, which is said to be justified by the reduced cost of manufacture of 50-cycle motors, in particular, needs the most careful examination; and the load curves of the districts in which the conditions have been fully investigated ought to be made available.

At a time when a million workers lack employment, when large sums are being paid out to prop up the coal-mining industry, and when it is proposed to spend five millions a year for a long time to come on works which cannot possibly become remunerative for many years, it behoves us to examine most carefully the foundations upon which it is proposed to erect so costly a superstructure. In such a case it is not sufficient to argue that the matter has been investigated by experts; the proofs must be forthcoming, and must be subjected to the closest scrutiny. To make a mistake at this juncture would be disastrous.

The I.E.E. Dinner.

THE attendance at the annual dinner of the Institution of Electrical Engineers on Thursday last week broke all previous records, nearly 600 tickets being issued and many more applied for. The brevity of the speechmaking at this dinner, and the opportunity of meeting friends from all parts of the country at the reunion which follows, render it an exceptionally enjoyable function; it is surprising, however, how many members of the Institution are not aware of the admirable procedure which has so long characterised it, and which makes it so much more attractive than other gatherings of a similar nature.

Mr. Neville Chamberlain is always interesting, and on this occasion, inevitably, dealt with the new electricity supply scheme, doubtless anticipating that his remarks would arouse the enthusiasm of a meeting of 500 electrical engineers. If so, he was disappointed, for his references to the benefits to be conferred upon the industry and the nation by the provisions of the scheme were received with frigid silence, the only attempts at applause being accorded to the assurances that no subsidy, no nationalisation, and no more state interference than was unavoidable, were contemplated.

The President, in the presence of his Ministerial guests, who are his personal friends, refrained from criticism, and not a discordant note marred the proceedings. But the silence was eloquent.

German Activities in Russia.

IT appears that the agreement concluded between the Berlin A.E.G. and the Soviet State Electrical Trust, to which reference was recently made, was entered into several months ago, and proposes to authorise the Trust to use the German Company's patents for machinery, &c. The German Company stipulated that the agreement should be confirmed by the Russian Government, and it is now stated that the latter has ratified it. Nevertheless, some time will still be occupied with the negotiations with regard to the grant of the first proposed credit of £5,000,000 in the form of goods, namely, for the opening up of the oil fields, for which Russia requires a credit of from 12 to 24 months. In A.E.G. circles the opinion prevails that the experience hitherto gained in connection with business with Russia wholly justifies the grant by German interests of large credits for the financing of deliveries, as the transactions with the Russian contractors are said to have been as smoothly liquidated as was generally possible. It is uncertain how much of the £5,000,000 will be applied to the acquisition of steam turbines for the pipe line pumps and how much will be expended on pipes, steelwork and machinery; but it is considered that many firms and banks will participate in the business. In connection with the preceding observations, attention may be directed to one part of the annual report of the A.E.G., which states that the Company regards Russia as a large market, and much is expected from the conclusion of the new agreement, concerning which negotiations have been proceeding for the past two years. The agreement chiefly concerns the grant of licences to the Electrical Trust for the construction of machines, and for this privilege the Trust will pay royalties. After confirming the circumstance that the agreement has now been confirmed by the Soviet Government, the report states that the Company formerly worked Russia intensively, knows the conditions, and is therefore at an advantage over foreign competitors. A considerable business is being done with Russia, and no difficulties have hitherto been experienced in the matter of obtaining payments.

Electrical Research.

IT would appear that the British Electrical and Allied Industries Research Association has perforce to be content in future with a smaller measure of Government financial support. After the larger expectations, consequent upon the known and cordially expressed approval of the Inspectors appointed by the Department of Scientific and Industrial Research, the actual outcome is distinctly disappointing. The powers that be seem to overlook the essential importance of the matter; or perhaps they have never fully realised it. Indeed, it is hard to conceive how such a retrograde decision could have been made were those responsible really awake to the issues involved. There are flagrant instances where a penny saved is tantamount to a shilling thrown away. In this particular case the Government department directly involved lavishes praise upon the good work done by the Association, but the authorities have decided that during the further period of five years commencing in September of last year, the aggregate grants shall be halved, and that at the end of the five years the whole cost must be borne by the industry.

Mr. Ll. B. Atkinson, the newly-elected president of the Association, who announced the decision of the Government on Friday last, at a luncheon at the Savoy Hotel, had many trenchant comments to make in the course of a speech of exceptional eloquence and vigour. As reported elsewhere in this issue, he stated that after public and official indifference to the scientific spirit and methods, things had changed during the war; but a few years later the politicians fell back into their old ways. After referring to the prospective expenditure of twenty millions sterling to support the most backward industry in the country, he urged that "any Government, any industrial leaders, who can fail to see that research by Englishmen can accomplish any and every result convict themselves of blindness to fact, lack of logic, and lack of imagination. Research associations and research workers are not asking for charity. They are urging that the present squalid civilisation should be replaced, as it can be, by a far better one, if applied knowledge in every sphere is encouraged and developed; that instead of being a last charge upon the resources of the nation, research should be a first charge."

Half a loaf is much better than no bread at all. In that the Association knows what awaits it, it has time to prepare for the withdrawal of government support. It is to be hoped that those most intimately concerned will take a long and progressive view of matters. Research is no mere accomplishment, something merely ornamental; it is bedrock necessity. The country is handicapped enough as it is; it were the veriest idiocy to increase that handicap gratuitously by killing the goose whence came the golden eggs. The nation's foremost competitors set Britain a stern race: and in her own defence she *must* put all she knows into the effort. Her crying need is for more and more of the truly scientific temper and methods of research, not for less. So, thrown more upon its own resources, the Electrical Research Association must seek ways and means to carry on. The electrical and allied industries must rise to the occasion. The partial withdrawal of Government aid must be accepted as a challenge to greater efforts, not weakly offered as an excuse for surrender. In the present year of grace it ought to be entirely self-evident that research, rightly undertaken, is a sound proposition on practical and commercial grounds. Those who have saved large sums of money through the work of the Association know that it is so, and ought to subscribe freely to its funds.

There are still five years in hand, and much may happen in that time. Certainly much *will* happen if the people who ought to be interested, and are most concerned, will take it in hand, definitely and deliberately, to see that it shall happen. The reports of the Association show that with adequate funds important economies, comparable with the hundreds of thousands of pounds that are annually saved through the researches on buried cables, can be effected in other branches of the electrical industry. Investigations are required on a scale far beyond anything as yet attempted, in connection with the properties of dielectrics, the design of switchgear, and overhead line construction. It is useless to wait for the Government to mend its ways—the industry can and must act for itself, remembering that money spent wisely on research is repaid not tenfold but a hundredfold.

Boiler-Room Practice.

Coal Flow, Air Flow, and Steam Flow.

By JOHN BRUCE.

(*Continued from page* 251.)

Considering first of all only the indications given by the Pitot tube manometers, it is obvious that with uniform fuel beds of equal thickness, the readings should have the same value. Any change in the fire bed conditions will immediately affect the air quantity and be shown by the manometer indications.

The difference between static and dynamic heads indicated by the Pitot tube manometers increases as the square of the air velocity, and neglecting the amount of gas added to the air above the fire bed as a result of the combustion of the fuel, the pressure drops measured by the differential gauges also vary as the square of the air velocities. There is therefore, for a given furnace condition, a direct relation between all the indications. By adjusting the densities of the measuring liquids, or varying the cross section of the manometer, the instruments will then, if all mounted together, show the same liquid levels for any given correct furnace conditions.

The relations between fuel-bed pressure drop, pressure drop through boiler, total pressure drop across unit, and the relations between the various pressure drops and resistances are very excellently expressed in one of the reports issued by the U.S. Bureau of Mines, and the liberty is taken of quoting the gist of them here:—

(1) "If all the resistances to the flow of gases remain constant, the pressure drop through any portion of the path will have a constant ratio to the total drop across the unit.

(2) "If the pressure drop across the unit remains constant, the pressure drop through any portion of the path will vary in the same direction as does the resistance to the flow in that portion, although the magnitude may not be in simple proportion.

(3) "If the resistance through any portion of the path remains constant, the weight of gas passing through that portion varies as a function of the pressure drop through that portion, *e.g.*, the weight of gases passing through the unit is directly proportional to the square root of the pressure drop.

(4) "If the total pressure drop remains constant and the resistance of the fuel bed is the only variable resistance, the weight of gases will vary inversely as the resistance of the fuel bed."

The young engineer cannot do better than memorise the foregoing facts relating to gas and air flow and also prove the truth of the statements by actual measurements by draught and differential pressure gauges.

So far we have only discussed the factors relating to air flow without considering the interdependance of the other factors affecting boiler efficiency.

Let us now consider the relationship that exists between rate of air flow and rate of fuel flow.

For this purpose we will assume a coal having an ultimate analysis based on the value as fired and as set out below:—

Carbon	C = 70.0	per cent.
Hydrogen	H_2 = 4.5	,, ,,
Oxygen	O_2 = 5.0	,, ,,
Nitrogen	N_2 = 1.0	,, ,,
Sulphur	S = 1.0	,, ,,
Ash	= 10.0	,, ,,
Moisture	= 8.5	,, ,,

Then with perfect combustion the air and oxygen quantities involved and the products of such combustion will be, per lb. of coal consumed, as shown in Table I.

From the Table it will be seen that the theoretical air required for the oxidation of the combustible elements of the fuel is 9.426 lb. of air per lb. of coal, and the theoretical products of combustion, plus inert gases and the vapour from the evaporation of the moisture content of the coal, will be 10.326 lb. per lb. of coal consumed.

TABLE I.

Oxygen and Air Required, and Products of Perfect Combustion.

Chemical symbol	Elements in coal lb.	O_2 and air required for combustion		Products of perfect combustion.				
		O_2	Air	CO_2	O_2	N_2	H_2O	SO_2
C	·700	1·862	8·044	2·562	—	6·182	—	—
H_2	·045	·360	1·555	—	—	1·195	·405	—
O_2	·050	—	—	—	·050	—	—	—
N_2	·010	—	—	—	—	·010	—	—
S	·010	·010	·043	—	—	·033	—	·020
Ash	·100	—	—	—	—	—	—	—
Moist're	·085	—	—	—	—	—	·085	—
Totals	1 000	2·232	9·642	2·562	·050	7·420	·490	·020
Less O_2 in coal & equiv. air & N_2		·050	·216	—	·050	·166	—	—
	To·als	2·182	9·426	2·562	—	7 254	·490	·20

Assuming 40.0 per cent. excess air as a value representative of efficient operating practice, then for an increment of 40.0 per cent. excess in the air requirements of the above fuel, there will appear in and additional to the products of perfect combustion—

0.867 lb. of oxygen
2.903 lb. of nitrogen,

equivalent to 3.770 lb. of air. Therefore it follows that if the foregoing coal was being burned in a steam boiler furnace with an excess air value of 40.0 per cent., each pound of coal consumed would require 13.196, say, 13.2 lb., of air.

It further follows that if at all loads on the boiler complete combustion could be effected with a constant excess air value, then a straight-line law expresses, at any load or combustion rate, the relationship existing between the air required for combustion, the coal being consumed, and the products of such combustion. These relations are shown graphically, expressed for the case given, in fig. 2.

For the point next to be considered, the rates of flow of coal, gas, and air, over a definite range, still assuming 40.0 per cent. excess air, have been extracted from the graphical values in fig. 2, and are set out in tabular form below.

Table II.—Coal, Air and Products of Combustion. Quantities Involved when the Coal Analysed in Table I is Completely Consumed with 40.0 per Cent. Excess Air.

Lb. coal consumed per hour.	Lb. air supplied per hour.	Lb. combustion products per hour.
1,000	13,200	14,100
1,500	19,800	21,150
2,000	26,400	28,200
2,500	33,000	35,250
3,000	39,600	42,300
3,500	46,200	49,350
4,000	52,800	56,400
4,500	59,400	63,450
5,000	66,000	70,500
5,500	72,600	77,550
6,000	79,200	84,600
6,500	85,800	91,650
7,000	92,400	98,700

Now under the conditions assumed, for any rate of air flow there will be a corresponding rate of flow of gaseous combustion products through the gas passes of the boiler, and from the laws governing the flow of air and gases there will be a definite relation between the pressure across, for instance, the boiler, and the rates of flow of air, fuel, and gas.

Assume, in the example at present under consideration, that between two fixed points in the gas path, between which two fixed points the resistance to the flow of gas is constant, at a rate of flow corresponding to 35,250 lb. per hour, the pressure drop is measured and found to be 0.2 inch water gauge. Then theoretically the pressure drop at any other rate of flow, assuming of course complete combustion and the same excess air percentage, will be as follows:—

Let p = actual measured pressure drop inch w.g.
,, f = rate of flow corresponding to observed p.
Then $f^2 = \kappa p$, and $\kappa = f^2/p$;
and the pressure drop for other rates of flow will be:—

$$p1 = f^2 1/\kappa,$$

where $p1$ = required pressure drop inch w.g.
$f1$ = rate of flow at required pressure drop.
κ = constant.

For the case under consideration the pressure drop at a rate of flow of 35,250 lb. per hour is 0.2 in. w.g.
Therefore $\kappa = 35{,}250^2/.2 = 6{,}212^{105}$ (approx.).

The pressure drop corresponding to the other rates of flow will then be as set out in Table III.

Table III.—Rate of Flow of Combustion Products and Corresponding Pressure Drops.

Lb. combustion products per hour.	Pressure drop across gas path.
14,100	0.033 inch water.
21,150	0.072 ,, ,,
28,200	0.128 ,, ,,
35,250	0.200 ,, ,,
42,300	0.288 ,, ,,
49,350	0.392 ,, ,,
56,400	0.512 ,, ,,
63,450	0.650 ,, ,,
70,500	0.800 ,, ,,
77,550	0.967 ,, ,,
84,600	1.150 ,, ,,
91,650	1.350 ,, ,,
98,700	1.570 ,, ,,

These values are shown graphically in fig. 2, and a study of all the values plotted will show that, provided the complete combustion of a given coal can be effected with a definite percentage of excess air, there exists a definite relation between the pressure drop over a path of constant resistance, the rate of flow of air, rate of flow of fuel, and rate of flow of gaseous products of combustion.

All the factors so far discussed can be readily measured in definite terms by simple instruments; moreover, the measurements are such that they are easily understood, and their value is directly influenced by the principal operating controls upon which the resultant performance of the boiler unit is dependent.

The next point to be considered is the relationship between the factors affecting the rate of heat liberation, again assuming the complete combustion of the fuel and the rate of heat absorption by the heat-carrying mediums contained in the boiler unit.

The rate of heat liberation can be expressed in terms of B.th.u. per hour, and the rate of heat absorption can be similarly stated.

Steam is the final form of the medium, carrying from the boiler unit the heat absorbed from that resulting from the combustion of the fuel.

Therefore if the feed water enters the boiler unit at a constant temperature, and the steam produced for useful work has a constant state point, *i.e.*, constant pressure and final temperature, the rate of flow of steam can be substituted for the expression of rate of absorption of heat units. Rate of flow of steam is customarily expressed in terms of lb. per hour, and can be indicated or recorded in such terms by modern steam flow meters to a degree of accuracy well within the limits required for commercial operation.

Considerable controversy has often arisen over the question of a linear relation between coal consumed and water evaporated, or steam produced, over the range of duty of a boiler unit on commercial operation. This controversy reached a notable degree after the presentation of a paper on pulverised fuel before one of the Institutions about two years ago, and this in spite of the fact that the performance of the particular boiler in question, from the results given in the paper, reasonably satisfied a linear equation. Further, various experimenters have from time to time given practical proofs of this relationship. Engineers must realise that power-station operation, in the present state of the art, necessitates common-sense compromises between the ideals of mathematical precision and practical attainment.

(To be continued).

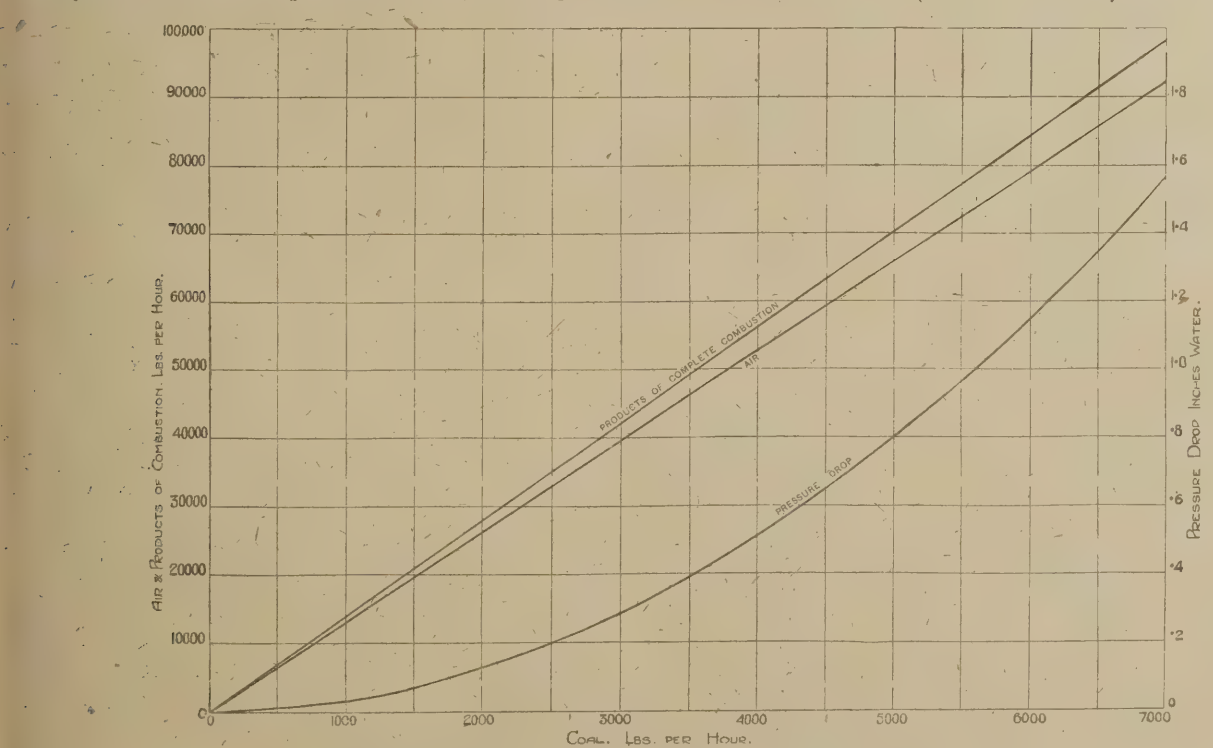

Fig. 2.—Rate of Flow of Combustion Products and Corresponding Pressure Drops.

Railway Electrification in Venezuela.—Owing to the swiftness of the motor traffic on a great concrete road in Venezuela, it is declared that a railway company has found it necessary to substitute electric for steam traction in order to keep its hold on the passenger traffic. This confession is said to have been made by the chairman of La Guaira and Caracas Railway Co., Ltd. (Mr. J. A. Goudge, C.B.E.) at a meeting of shareholders held in London. The situation in Venezuela, he said, was that they had to deal with growing traffic and growing competition, and the Board was convinced that electrification was the only course. They were now seeing the completion of the concrete cart road, and they knew that the motor-car could take passengers between the leading port of Venezuela and the capital in less time than the journey occupied by their railway with steam traction.

Laboratories for Testing Electrical Mining Apparatus.

The Mines Department's Testing Station, Sheffield.

The official testing station of the Mines Department at Sheffield, to which we recently had the opportunity to pay a visit, has lately been established for the testing of the smaller classes of mining apparatus, sent in by the manufacturers, including miners' electric and flame lamps and electric bells, relays and the like

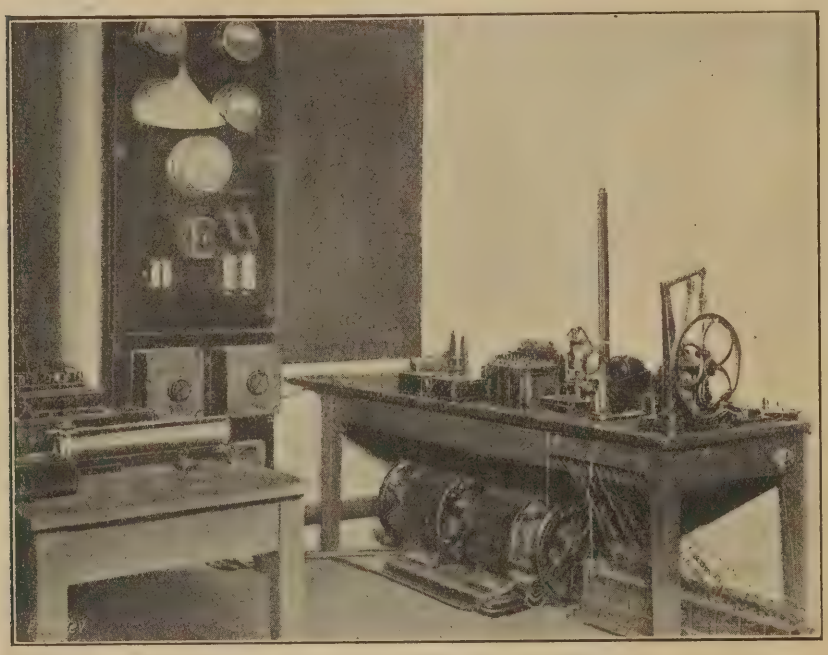

Fig. 1.—Electrical Test Room.

used in the signalling installations, in order to ascertain whether or not the samples comply with the approved specifications laid down in the official regulations. Other work, such as the analysis of samples of mine air and the dust on the mine roadways, sent in to the station by the mine inspectors, is also carried out. The dust samples are analysed to determine the amounts of moisture and combustible matter in them, while the samples of air are so treated to find out the percentages of their constituent gases.

Up to the end of last year the station formed part of that of the Mines Department for experimental work at Eskmeals, and it is due to the inaccessibility of this site that the station has been removed to Sheffield. The experimental station of the Safety in Mines Research Board has also been removed to Buxton.

The premises at Sheffield, 42, Arundel Road, occupy an old factory, which has been reconstructed and converted into laboratories, offices, and the other necessary parts of the station by H.M. Office of Works. Of the number of laboratories which constitute the station, the electrical test room, fig. 1, is probably the most interesting to electrical engineers. This room is equipped with a specially-designed motor-generator for supplying a pure sine-wave alternating current, an oscillograph which is used to obtain the characteristics of the current in various pieces of apparatus, and special equipment in which the safety or otherwise of the sparks produced between the contact points on bells and relays can be tested in mixtures of firedamp and air. The last-mentioned apparatus consists of small strong glass chambers contained in metal casings. Gas mixtures of known quantities are placed in the chambers, and by means of suitable leading-in wires with adjustable air-gaps, sparks are produced in the mixtures and the necessary observations are made and data, such as pressures and temperatures, collected. By noting on the oscillograph the characteristics of the current in a circuit in which an arc is produced, a current of a similar nature can readily be reproduced in the circuit in use with the testing chambers. The testing room is contained on the first floor, which also accommodates the main analytical laboratory, fig. 2. The work of this department is mostly of a chemical nature, consisting of the analysis of mine-dust samples. Six thousand samples of dust are sent into the station each year by the mine inspectors. A modern type of combustion furnace for the ultimate analysis of coal samples is another feature. The powdered coal is placed in clay trays in a glass tube contained in the furnace. When the coal is heated to the required temperature, oxygen is passed over it from one end of the tube, and the combustibles are collected at the other end. A number of electrically-heated drying ovens, fig. 2, for dealing with the various samples form part of the equipment. The mine-air samples are also analysed here. They are collected from the pits in small glass bulbs, which are sent out from the station in a highly exhausted condition, being, of course, hermetically sealed. The inspector, in collecting the sample, simply breaks the glass seal of the bulb, which he re-seals by means of a heavy rubber cap. After analysis of the air samples,

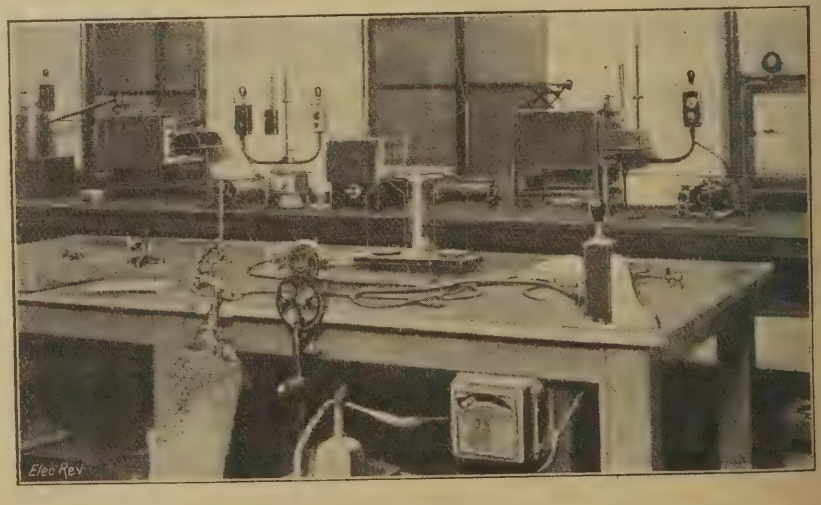

Fig. 2.—Main Laboratory.

the bulbs are re-exhausted in the main laboratory by means of high-efficiency electrically-driven vacuum pumps contained in the basement. To ascertain the degree of exhaustion in the bulbs, they are subjected to high-frequency currents in a dark room, green rays in the bulb indicating the proper vacuum. In passing, it is interesting to note that various inflammable dusts produced in industrial operations, for example, paper, cotton, sugar, and flour dusts, are subjected to

inflammability tests in this section on behalf of the Factory Department of the Home Office. The photographic dark room and a balance room, containing four chemical balances, are adjacent to the main laboratory, and on the same floor is a small research room in which investigations of a special nature incidental to the general work of the station are carried out.

On the ground floor are accommodated the offices, a photometric room and a lamp-testing laboratory. In the former, provision is made for two standard photometers, and at present the instrument which was used at Eskmeals is installed; this has been overhauled and improved technically. The lamp-testing laboratory, fig. 3, is equipped for the testing of all kinds of miners' electric and flame lamps. To the left of the illustration in question will be seen a number of electric lamps under life and efficiency tests. Special testing boards are equipped for the efficiency trials and also for determining the discharge of the accumulators under given conditions. An electrically-heated oven, in which the well glasses of the flame lamps are dealt with, is a feature of this room. The glasses are heated up to 212 deg. F. in a suitable container and then immersed immediately in cold water. An apparatus for the observation of flame in still atmospheres is an interesting feature. Firedamp mixtures are pumped into an inverted glass chamber, fig. 3, by means of an electrically-driven fan, the percentage mixture of air and firedamp being regulated by means of drilled metal disks, which are inserted in the control valve. A mercury-suction air pump, in which an electric arc is produced in the container, is used for determining the inflammability of the mixture.

The basement at present accommodates the necessary stores and workshops, and a lamp gallery is now under construction. In the workshop is housed a Crompton motor-generator with the necessary control gear for the d.c. supply throughout the station. The vacuum pumps are also housed here, and are connected by piping to the various points in the laboratories where vacuum is required. A motor-driven blower also supplies compressed air to the main laboratory for glass-blowing and miscellaneous purposes.

The lamp gallery has been redesigned, and is a modification of that previously used at Eskmeals; the essential principles of utilising vaporised pentane and air as the explosive mixture has been retained. Explosive mixtures travelling at a velocity of 1,200 ft. per minute and more will be available for testing miners' flame safety lamps. An explosion chamber for the testing of miscellaneous apparatus in still explosive atmospheres, and an equipment for testing the mechanical strength of miners' lamps is also installed in the basement.

The testing superintendent, Captain Platt, to whom we are indebted for the above details, has asked us to state that he is anxious that the mining industry should realise that he is concerned not only with the carrying out of strict tests as laid down in the official regulations on the testing of apparatus, but that he desires, where possible, to be of assistance in such matters as come within the field of his activities; he invites those interested in the improvement of the efficiency of miners' lamps and kindred apparatus to communicate with him, when he will be pleased to offer facilities for tests of an experimental nature. The official regulations stipulate that a fee be charged for the test of miners' lamps, and in special cases the amount of this fee is left to the discretion of the testing officer. At the same time, he wishes to point out that, where a manufacturer or designer is anxious to improve the efficiency of his product, no difficulties will be placed in his path in the matter of having preliminary tests and experiments carried out at the station, and for this a fee will not always be required.

The Mining Electrical Testing Laboratories of Sheffield University.

Apart from the work of the official Mines Testing Station, a very important branch of the testing and research operations in connection with mining electrical apparatus, that dealing with flame-proof electrical machinery, is undertaken by the Mining Department of Sheffield University. The work is divided into two sections—experimental and testing—the former being devoted entirely to research by the Safety in Mines Research Board, while the testing of manufacturers' apparatus is undertaken by the University department proper. The testing laboratories are maintained by testing fees, although no profit is made, and the fees vary according to the amount of work entailed. The research room is equipped mainly for investigations in connection with the flame-proof design of electrical machinery and particularly in determining the behaviour of ignited gases and flame inside an electrical-machine enclosure. For the necessary experiments spherical explosion vessels are used. These are constructed in two cast-metal hollow hemispheres with flanged joints, one half (top) being fitted with adjustable electrodes, so as to provide an electrical ignition at any point in the sphere. For the investigation of the desirability of, and the effect produced by, vents between the flanges, small brass distance pieces of given thicknesses are placed between the two halves of the globe, which are

Fig. 3.—Lamp-Testing Room.

then clamped together. The bomb is placed in an explosion chamber, two of which are installed in the laboratory in question; the bomb and the chamber are filled with gas of a required mixture. A spark is then produced in the sphere and the necessary observations are made. It will be obvious that by this means a wealth of information concerning both the gases and the protective measures is obtainable. The air gaps are varied by means of the distance pieces, and the flange-widths are also varied by inserting flat metal rings of differing widths between the sections. The explosion chambers are of wooden construction with relief-valve "windows," the valves consisting of white paper, smeared with linseed oil, suitably secured over apertures by means of frame flanges held by wing nuts. The gas used for these experiments is obtained from the Cymmer Colliery, South Wales, and contains 88 to 98 per cent. methane. The mixtures are made up in two gas holders; these are of 10 and 20 cu. ft. capacity respectively.

All manner of electrical mining apparatus received direct from the manufacturers is tested in an adjacent laboratory. This is equipped with a large explosion chamber designed to accommodate all sizes of mining machinery, up to a normal-size coal cutter, which of necessity must be flame-proof. This chamber is of similar construction to the smaller ones. It is built of pitch pine, the internal surfaces being treated with fireproof asbestos paint. The front and top of the chamber are removable, and in order to facilitate the handling of heavy apparatus, suitable blocks and

tackle are suspended from the overhead girders of the test room. For testing small apparatus, the chamber can be sectionalised by means of a central partition. To ensure the complete diffusion of the gas inside, a 16-in. fan is employed; this is driven by a fractional h.p. electric motor mounted outside on the chamber roof. When a piece of machinery is to be tested, the casing or enclosure is suitably drilled to accommodate a connection to a manometer or pressure recorder, which is used in connection with all such tests, a sparking plug for igniting the internal gas (an ordinary automobile plug is generally used), and the necessary connection for the gas inlet. Although, of course, the primary object of the tests is to ascertain whether the apparatus under test is explosion proof or not, much valuable information is obtained from the records of the manometer. The internal pressures are communicated to a small piston contained in an oil-filled cylinder. The movement of the piston is transmitted to a flat spring carrying a stylus, the latter pressing lightly on a smoked paper chart on a revolving drum. The time records are made by two Deprez time markers. One of these is connected in circuit with an electrically-vibrated tuning fork, making a given number of vibrations per second, enabling the time scale, from the rate of rotation of the drum, to be calculated. The other marker is connected with the primary circuit of the sparking coil and records the actual instant of ignition, and shows a typical time-pressure curve taken from such a test. A sampling-vessel at the back of the chamber is employed for the collection of samples of the gas from the interior of the apparatus under test or the explosion chamber. The samples are subjected to analysis for determining the exact composition of the mixture in the casing.

A certificate, recognised by the Mines Department, and a report of the test results, are issued by the University for each piece of apparatus which passes the standard test, but with a view to assisting the makers in improving the design of their plant or in developing new lines in mining machinery, the laboratories undertake special tests and provide the manufacturers with the full results. It is interesting to note that for the standard test the most explosive gas mixture is used, containing 9.5 to 10.5 per cent. of methane. In the case of motors, tests are made both with the motor stationary, and running at normal speed with resulting turbulence. The effect of the turbulence of the mixture is to hasten the rate of development of the pressure when the gas is inflamed. The ignition spark is obtained from an ordinary induction coil with a pre-measured current.

The two departments, research and testing, while under quite independent authorities, work in very close co-operation; and the data obtained by one are fully at the disposal of the other.

In conclusion, our thanks are due to Professor I. C. F. Statham, B.Eng., of the mining department of the University, for his courtesy in placing the above information at our disposal on the occasion of a recent visit to the laboratories.

The Cologne Wireless Show.

Some Impressions of the First Radio Exhibition in West Germany.

(From Our Special Correspondent.)

The Exhibition at Cologne revealed the important fact that German manufacturers have made great strides in the production of wireless apparatus, particularly in the direction of good and cheap parts and accessories. A general review suggests that they have not yet made up the leeway lost through special post-war circumstances, but they are marching forward and intent on making good the boast that Germany will, before long, compete on equal terms with the United States and Great Britain in the laboratory and in the outside radio field. It does not require a great deal of imagination to believe this, for it has been seen what Germany can do in the electrical world, and her efficiency in this direction is proof of her ability to succeed in "wireless."

Die Westdeutsche Funkaustellung opened (January 30th to February 7th) under the management of the Reichsverband Deutsche Funkändler (Union of German Radio Dealers). While Government duties and the Vienna Conferences prevented the Minister of Posts and Dr. von Bredow (the father of German broadcasting) from being present at the opening ceremony, the Exhibition was given an enthusiastic send-off, and was immediately besieged by great crowds of visitors, who showed the liveliest interest in what, to most of them, was an entirely new art and entertainment; for the Cologne bridgehead has not known wireless, since the allied military forces in occupation on the Rhine forbade its use. But on January 30th the last of the occupational troops left Cologne, the territory became free, and automatically the wireless ban was lifted. Nothing could be more natural than that the Exhibition should, in these circumstances, take on the air of a national demonstration, and the keenness of the crowds which flocked to the permanent Fair Buildings was perhaps keyed up as much by this spirit as by a suddenly-awakened interest in radio-telephony. The Exhibition became a wireless educational centre for those of the inhabitants who had heard of, but never experienced, the joys of radio, and it must be said the standholders rose to the occasion and freely initiated inquiring minds into the mysteries of the new entertainment. Authority also did its best, for it was desirable that what happened after the Ruhr evacuation should not be repeated. Then, many of the inhabitants of the district were defrauded by unscrupulous vendors of obsolete and worthless wireless equipment, the ignorance of the people on the subject being taken advantage of to such an extent that the sound, straight, trader was in danger of suffering considerable harm by the natural reaction.

The Ministry of Posts, therefore, took a large space at the Exhibition, and provided a kind of museum, which included some of the earliest apparatus experimented with, and showed development down to the most modern installations. There were included the first Lorenz-Poulsen generator for telephony, a Tessler arc generator, a Braun coupled-transmitter with sparking gap and resonance inductor, several valve transmitters, variometers, Telefunken's first valve transmitter in direct connection or working off an aerial, and Thomson's experiment, which shows the inductive effect of alternating current on a conductor placed in the magnetic field. Modern short-wave transmitters and receiving-station equipment occupied another part of the museum, with a model of the Berlin-Hamburg train, which is equipped with wireless telephony for service while running.

The Institute of Physics of the Cologne University had a display of advanced apparatus built by the students, who were present to give information to inquirers, while it having been aranged to transmit music and speeches to the Elberfeld transmitting station for broadcasting—Elberfeld being nearest to the Cologne area—a special audience chamber had been constructed with one side made of sound-proof heavy plate glass. Visitors could in this way see the performers before the micro-

phones and get the music back from Elberfeld on the earphones. A Reiss microphone was employed, while two other microphones served for the loud-speakers in the entrance hall and the concert room in the East Gallery, where a giant 10-ft. loud-speaker (by Otto Gennrich, of Düsseldorf) was in operation.

In one wing of the gallery the West German Radio Union displayed apparatus built by members, while in the two main halls practically all the important German manufacturers were represented. It was noticeable that valves and loud-speakers of all makes were predominant, with very efficient earphones, which were comparatively cheaply priced, 10s. 6d. being the figure for the best. Of receiving sets, all kinds were exhibited, but the chief demand was for the two-valve set, the prices of which ranged from £5 to £6. The reason for the run on this particular type of set was the earlier experiments which proved simple crystal sets to be pretty well useless in Cologne, which has no transmitting station in the area. The two-valve set, however, is good enough for most of the German stations, and the cost is little more than that of the simpler instrument.

While the Exhibition became a particularly patriotic affair, its supposedly international character was not entirely lost, for British, Scandinavian, French, and other nationalities were exhibiting and received satisfactory attention. Among the British firms were Marconi's, with the "Sterling" loud-speaker, &c.; Wireless Equipment, Ltd., exhibiting the "Perfex" aerial; and Neutron, Ltd., which reported good business with its particular wares.

In conclusion, it may be remarked that the display was a retailers' show, for German manufacturers did not exhibit on account of the expense involved, but they gave the Exhibition their support. There were over 100 exhibitors, and the novelty of the show was a five-electrode, single-valve, receiver which works a loud-speaker at a distance of 30 miles from the transmitting station.

The Testing of Transformers.

Some Observations on a Method of Ratio Testing.

By D. PEDLEY.

IN the Institution of Electrical Engineers' paper by Messrs. J. L. Thompson and H. Walmsley* there appears to be a serious discrepancy in the authors' method of ratio testing which needs to be pointed out.

In the first place, in fig. 1 of their paper, which I have, I think correctly, reproduced in fig. 1 herewith, it will be understood that when the switch S_1 is closed, the field-coil windings of the wattmeter are directly connected across the high-pressure supply; quite obviously, unless the wattmeter is specially designed (I may emphasise the word "specially") this method of connection is inadmissible.

From a perusal of the article I am inclined to think that Mr. Thompson intends the field coils of the wattmeter to be connected in series with the h.p. winding as I have shown in fig. 2.

Such a method of ratio testing is no doubt workable; but I consider that the degree of accuracy obtained would not be all that is to be desired, and in the testing of instrument transformers would be inadmissible for the following reasons:—

It is obvious from an examination of the circuit that the fundamental principle of this method of testing depends on the fact that when the wattmeter indicates zero, there shall be no current flowing from the l.p. winding, through the shunt coil of the instrument, to the resistance r; or, in other words, that the p.d. between the points a x shall be exactly the same as the p.d. between the points b x. If any current is flowing through the shunt coil of the wattmeter, there would be a p.d. between the points a b, and calculation would be necessary to include the resistance between a b in the resistance r referred to by Mr. Thompson; also, further calculation would be necessary to ascertain what the indication of the instrument should show.

Assuming that the above condition holds good, *i.e.*, that there is no current flowing between a and b, we require to assure ourselves that the wattmeter will indicate zero.

Further consideration leads us to the fact that the wattmeter will only indicate zero, even under the above conditions, if and when the transformer has no phase error: *i.e.*, it may be possible for the instrument to indicate zero, when there is a slight current through the shunt coil.

It is well known that all transformers possess phase error, since even in specially designed instrument transformers it is not eradicable. It is difficult, and of little use, to estimate the error caused by the above, since it may either add to, or subtract from, a possible phase error of the instrument itself.

I would therefore like to draw attention to a modification of the above method, as indicated in fig. 3, which is free from its defects, and possesses all its advantages, together with some others. The principle of the test is as before; *viz.*, that the value of the resistance r is so adjusted that there is no difference of potential between the points a b, thus the instrument will indicate zero, and the ratio of the voltages HP/LP = R/r as before.

It will be noted that this method is free from the effects of phase error in the transformer, since we are actually measuring current, or rather the absence thereof; whereas in the previous method we measure current × cosine ϕ, where ϕ = the angle of phase error in electrical degrees.

This method is at once simple, since it is easily connected up and requires only one instrument observation; and, at the same time, accurate, since a minimum of calculation is required, and the important portion of the apparatus, *i.e.*, the resistance, is not liable to alteration.

The British Industries Fair—II.

Electrical Features and Meetings.

The British Industries Fair is now in full swing. Unfortunately we have to go to press too early to enable us to report the proceedings of the principal electrical day—Wednesday—but at the Press inspection on Friday last we saw enough of the Electrical Section at Birmingham to enable us to speak with knowledge concerning its forward state and its business-like character. On Monday the official opening took place.

Before proceeding to particularise the numerous electrical and allied exhibits that appear in the Electrical Trade Section and those which appear elsewhere—some firms had selected their positions before it was definitely known that the electrical section would be so successful and they were unable to transfer—we think it will be appropriate if we refer generally to the various directions in which credit is due for the unquestionable success of the movement.

In November last it was feared that notwithstanding the strength and extent of the British electrical industry and its export trade potentialities, electrical products would be few and far between. Mr. T. R. Martin, of Messrs. J. H. Tucker & Co., and several other electrical gentlemen moved in the matter, and at the suggestion of Mr. Martin and the Birmingham Chamber of Commerce, we went down to investigate the situation. We have been closely interested in the British Industries Fair from the moment of its birth when the Electrical Review was conferred with by the Government authorities in these offices shortly after the outbreak of war, and it has always been a matter of some surprise to us that the electrical trade has not previously risen to the occasion. We believe that at the beginning want of space and pre-occupation with the war were to blame for the lack of enthusiasm on the part of electrical manufacturers. Then Wembley was a costly undertaking which compelled our firms to neglect the Fair. This year was regarded as an appropriate time for a re-awakening of interest, but there was no enthusiastic effort made until December. Considering that only about two months have elapsed since that effort was born, it is obvious that credit lies in certain directions, and we wish to give unstinting congratulations where they are due. Of course, without publicity and earnest appeal through the Press, little could be expected. Therefore, as we thoroughly agreed with the objects of the originators, we gave the subject prominence and force in the Electrical Review. The efforts of Mr. T. R. Martin in taking the initiative and of the small electrical committee that was appointed at the meeting held in Birmingham on November 24th; the work of Mr W. A. Gillott, as secretary of the Electrical Trade Section (who undertook space-selling to the electrical firms, we believe, at the suggestion of Mr. Dunlop); the service rendered by Mr. E. J. Jennings, secretary of the Birmingham Corporation Electric Supply Department, as Honorary Secretary of the Electrical Trade Section; the enterprising co-operation of the Birmingham Corporation Electric Supply Department in putting down additional plant at considerable outlay to meet the needs of exhibitors for so brief a display;—all of these have been co-operating factors which made so good and so quickly-executed a show possible. Last, but by no means least, congratulations are due to the eighty or more manufacturers of British electrical products who so readily decided to take space when Mr. Gillott approached them. We believe that if there had been another fortnight in which to arrange matters, half as much space again could have been let.

It now remains to be seen what results will be obtained. It is recognised that the show is more or less an experiment this year. If it is found that Press publicity and the efforts of the Department of Overseas Trade are the means of bringing together the right class of Overseas buyers in sufficient number and if the various organised visits secure the presence of many Home buyers of electrical goods, it will be easy for the electrical industry to make up its mind with regard to the place of electrical goods in the Birmingham Fairs of future years. While the Fair is open, exhibiting firms and others will be forming their own judgment on this and on several other points to which we shall allude later.

The First Function.

The "Press view" of the Fair took place on Friday, February 13th, and Mr. H. E. Parkes, President of the Birmingham Chamber of Commerce, who presided at the luncheon, stated that that body believed in the future of the Fair; and in his opinion it would supply an eloquent reply to those who imagined that British industry was decadent.

The toast of "The Press" was submitted by Mr. R. C. Rodgers, chairman of the Management Committee, who stated that there was no place in the world where the buyer was enabled to visualise under one roof such an immense variety of hardware, and of the allied trades' goods. The stands if placed on end would extend a distance of eight miles. As newspaper men they doubtless appreciated the importance of continuity in advertising, and he was sure they would equally recognise the importance of continuing the Fair as an annual fixture.

Mr. A. H. Bridge (Electrical Review) replied on behalf of the Technical and Trade Press. Speaking of the Fair, he expressed the view that the present electrical display would really mark the beginning of a great electrical section, and that it would become a permanent feature. The electrical industry had been described as one of the bright spots in the industries of the nation. He thought it was going to make a trade atmosphere that it had never made before. He agreed with Mr. Rodgers that the idea of continuity year after year should be pressed home. There had never before, in his long experience, been brought together such a collection of electrical trade articles in market form in so short a space of time. When some of them went down in November and saw the empty buildings that were available for an electrical show they thought it would be very satisfactory if some 50 electrical exhibit shop stands could be secured and prepared within so short a time, but it had been proved that they were not as optimistic as they might have been. Everything depended now upon what happened during the next fortnight. "I hope," he concluded, "that this section of the fair will turn out to be the nucleus of a great annual electrical market."

We commence below descriptions of the exhibits of electrical and allied firms:—

The Chloride Electrical Storage Co., Ltd.

This company exhibits a full range of its batteries for all applications. Among the latest products shown are the company's h.p. batteries for radio work. These are made up in 24-V units in a multi-compartment glass box, or in 20-V units assembled in separate glass boxes. The usual range of batteries in celluloid cases is also exhibited as well as various patterns in glass containers. Higher capacity batteries similar to those used by the B.B.C. are available for inspection, and other types include those for marine radio installations and lifeboat sets and for emergency lighting and gyro-compass operation on board ship. Exide "Iron-Clad" batteries for traction purposes are included, and these are cut away to show the details of the special construction of the cells. Among the smaller types which are shown are cells suitable for miners' hand lamps and for other portable lamps. In contrast with these small models, large cells suitable for the under-water propulsion of submarines are exhibited. The "Lux" battery, specially designed for train lighting, is another type shown and other lighting batteries suitable for country houses, &c., are included. Photographs of Chloride batteries installed in some of the largest power stations in the country appear on the stand, and specimen plates of these large batteries are among the exhibits.

W. Canning & Co., Ltd.

The most recent developments in electro-plating and polishing equipments are exemplified in the exhibits of this company. One of the principal items is the "Rotamatic" electro-plating plant—an automatic apparatus in which the work travels horizontally through the solution. It is claimed that this ensures a uniform thickness of deposit while the solution is continuously filtered and returned to the bath. Electrical elements for heating electro-plating solutions, and enamelling stoves form the subject of another exhibit. These are designed in 110-V units in order that they may be used with any electrical supply. A new type of totally submerged electro-plating barrel and a heavy geared barrel for ball burnishing, together with specially designed resistance boards are also shown. The remainder of the stand is given up to low-voltage dynamos and motor generators for electro-deposition, polishing lathes, grinding machines, and materials used in the electroplating and polishing industries.

George Nobbs, Ltd.

This stand is devoted practically entirely to electric water heating apparatus. In addition to the well-known "Genii" immersion heaters, of which various patterns are shown, the application of these to a number of appliances is exemplified. The "Genii Vectis" water heater shown has a double-jacketed hard-rolled copper body well lagged with heat insulating materials. It is supplied with a loose double-jacketed top covering, a hot water outlet nozzle, and a cold-feed boss with control valve. There is a special immersion heater for constant and booster loadings. The latter range from 150 to 1,000 W to 500 and 1,500 W. The appliance is of neat appearance. The

Fig. 1.—The "National" Calorifier.

"National" calorifier, another exhibit, also has a body of double-jacketed hard-rolled copped lagged with special heat insulating materials, and the range of constant and booster loadings is the same as in the "Vectis" pattern. This calorifier is illustrated in fig. 1. For domestic use a special wall or bulkhead model is shown. This is made in a wide range of sizes, but the main principle is that when the cold water inlet valve is opened the water enters at the bottom of the tank. This pushes the hot water through the internal overflow pipe and out at the hot water nozzle; the cold water, it is said, does not mix with the hot water, but pushes it before it. These heaters are constructed of copper tinned inside and with a polished copper or nickel-plated finish. Hot-water radiators form another section of the exhibit. These are all of neat appearance and consist of cast-iron radiators in "column" design, each unit of which is fitted with an immersion heater. Patterns for affixing to walls or to stand independently are shown. A further exhibit is the "Genii" electric wash boiler. This is a hard-rolled copper tank, with a capacity of 12 gallons, mounted on three legs. It is provided with 3 or 4 kW loading.

The Falkirk Iron Co., Ltd.

Electric cooking appliances form the main exhibit of this company, a number of new patterns being on view. Among the new models is the "Falconette" cooker which has been

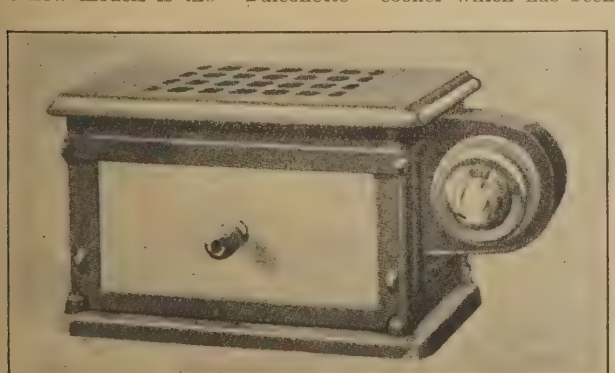

Fig. 2.—A "Falco" Breakfast Cooker.

specially designed for use in small flats and is suitable for a family of two or three persons. The oven has a bottom element only; there is a grill in the hob, which also serves as a boiling plate. The total loading is 2,250 W. The oven is 9 in. wide, 12 in. deep, and 10 in. high; the overall height is 22 in. Several other types of household cookers are shown, and they are remarkable for their very fine finish, most of them being fitted with porcelain enamelled casings. A new type of boiling plate is being employed. This is very strongly made and can be simply removed or placed in position by everyone. It is of the enclosed type and the elements are carefully protected from harm. Among the larger apparatus shown is a double oven range. The ovens are of different sizes and the doors are fitted with white porcelain enamelled panels. There is a large grill, and five semi-enclosed boiling plates. The total loading of this range is 14 kW. A number of smaller appliances are on view, including breakfast cookers, which are really miniature ovens. The pattern illustrated in fig. 2 is 16 in. wide, 10½ in. deep, and 8½ in. high overall. It weighs 32 lb. and the total loading is 2,000 W; a single element serves for the oven or for boiling, frying, &c. Boiling plates, irons and fires are also shown. Among the last is an illuminated dog grate type.

The English Electric Co., Ltd.

This company draws attention to one of its most recent manufactures, a 12,500-kVA, 110,000-V transformer (fig. 3), which is one of 12 built for a power transmission scheme in India. The size and weight of the transformer precluded the exhibition of the actual article, but a part of it appears upon the stand, together with photographs and other details. Each single-phase unit has a maximum output of 12,500 kVA at the B.E.S.A. rating of 65 degrees C. rise as measured by resistance corrected to the instant of shut down, and is of the water-cooled core type. The secondary windings are for 23,000 V; the primary windings are connected in delta and the secondary windings are star connected. The specified test pressure with which the units have complied was 240,000 V between windings and core, and the whole of the high voltage winding had to be insulated for this condition. Owing to the large size of the transformer, it has been found necessary to include many special features of design, including provision of

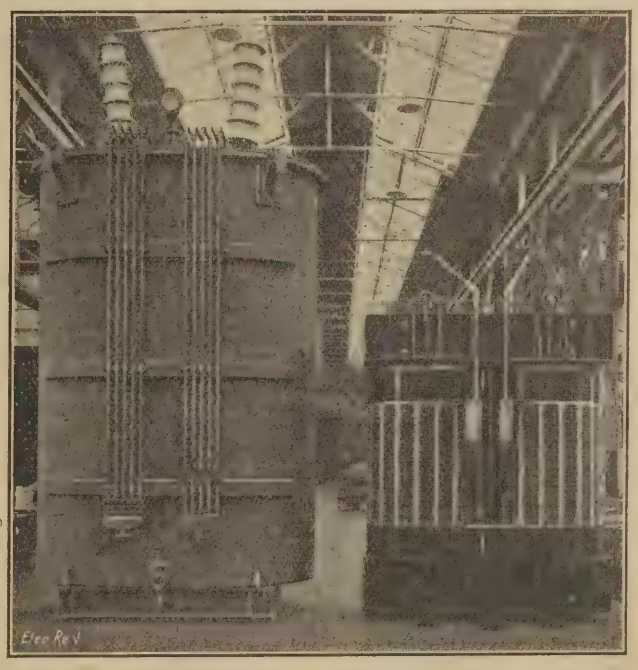

Fig. 3.—An "English Electric" 12,500-kVA 110,000/23,000-V Transformer.

internal cooling ducts throughout the magnetic circuit and the use of welded boiler-plate frames. The English Electric Co.'s "key bolt" construction has been adopted for the core; this eliminates all vertical tie bolts. The high-voltage bushings are of the condenser type and have porcelain shields to give the necessary creepage distance under wet conditions. They will easily withstand 555,000 V dry without flashing over, and 250,000 V under wet conditions. Other "English Electric" products exhibited are a 375-kW, 650-V, 1,500-r.p.m., 50-cycle rotary converter; an ironclad truck type switchboard and switch pillars; various standard a.c. and d.c. industrial motors, one of them a pipe ventilated machine with loose covers showing the method of conversion to the totally enclosed type; also a selection of small tools.

Sturge & Baker, Ltd.

This company is again showing its "Red Rose" fires, which are now made in five sizes, from 300 to 1,500 W. These are bowl fires with the element wires mounted upon a circular base. The design is varied in some new patterns exhibited, the element former being oblong in shape instead of circular. Another speciality of this firm is the flex absorber, and several different types and sizes are shown, the largest of which will support a weight of 10 lb. One pattern shown will take up to 120 ft. of flex.

The General Electric Co., Ltd.

It is the aim of the General Electric Co., Ltd., to show visitors the comprehensive nature of its productions. To this end each of the companies comprising this great organisation shows typical examples of its particular manufactures. The stand is 100 ft. long, and ovals upon the front of it indicate the various sections as well as the many oversea branches of the company imparting an idea of its widespread activities. The Witton Works is represented by heavy electrical engineering products, including generators, motors, switchgear and switchboards. One of these exhibits, a steel-works motor, is illustrated in fig. 4. Fraser & Chalmers Engineering

Works show a model of a turbine and various turbine components as well as a number of other mechanical engineering products. Salford Instruments, Ltd., exhibits measuring instruments, such as ammeters, voltmeters, insulating testing sets, inter-valve and telephone transformers, as well as Salford air circuit breakers, automatic time switches, &c. The Express Lift Co., Ltd., shows the complete gear for a lift installation at Messrs. Lewis's store, Birmingham, and other things connected with electric and hydraulic lifts. Samples of paper-insulated and v.i.r. cables are shown by the Pirelli-General Cable Works, Ltd. The Peel-Conner Telephone Works displays automatic and battery call telephones, including a 100-line section of an automatic exchange. "Gecophone" radio receiving sets also appear in this compartment. The Osram-

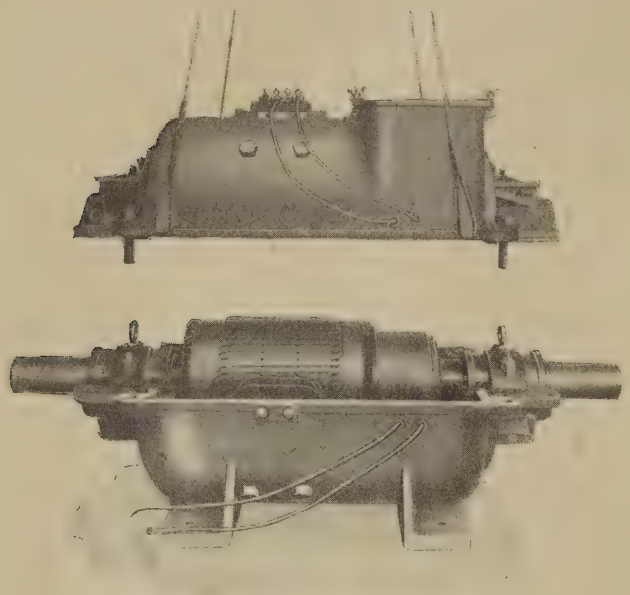

Fig. 4.—A G.E.C. Steel-works Motor.

G.E.C. Works shows examples of all types of lamps which it produces, as well as "Osram" valves in a variety of patterns for all reception and transmission purposes. A special section is devoted to "Magnet" appliances. Here there are electric lighting fittings of all types; British-made power-driven domestic electrical appliances, including refrigerators, clothes washers, dish washers, sewing machine equipment, drink mixers, egg whisks, vibrators, hair dryers, and vacuum cleaners. Electric heating and cooking are also well represented, as are the "Magnet" wiring system and installation accessories. Another part of the stand is devoted to "Freezor" fans of all types, including special patterns for tropical use. "Geekoduct" steel conduit and conduit fittings are shown in a novel manner.

The Castle Fuse and Engineering Co., Ltd.

This company exhibits a large number of "Triumph" fuses ranging from 5-A to 300-A capacity. The contacts used in this type of fuse are of the plug-and-socket pattern. The difficulty of non-alignment between the plugs and sockets has been overcome in a simple but effective manner; the plug is made considerably larger in diameter than the socket, so that it is too large to enter at all. The plug is then slotted by transverse longitudinal saw-cuts extending over the greater portion of its length; then it can be pushed in to enter the socket for some distance, but cannot be pushed right home. The socket itself is therefore slotted with similar longitudinal saw-cuts, and the plug can be pressed completely home in the socket, the pressure required being practically constant throughout the full length of the travel. The slotted end of the plug closes in as it approaches the bottom of the socket, while the top of the socket opens out as the slotted portion of the plug reaches it; thus, while both plug and socket each assume a form that is slightly conical, their relative surfaces are parallel and in intimate contact. The company is also showing various types and sizes of ironclad distribution boards, ranging from small double-pole 5-A boards in cast-iron cases, up to large 3-phase fuse assemblies of 300-A capacity in built-up steel cases with arc-proof and insulating lining. All the boxes are fitted with detachable end plates, which can be removed for drilling and during connecting up.

Credenda Conduits Co., Ltd.

The company's exhibit consists of the well-known "Creda" heating and cooking appliances. There is a range of electric cookers from a size suitable for providing for 18 persons down to a very small model to cater for two persons. The cookers are very well finished, and the chief features are the plug-in interchangeable elements; the oven interiors which can be removed in one piece for convenient cleaning; and the simplicity of the wiring, which is of bus-bar construction throughout. The company informs us that it is making great headway with these cookers, and has found it necessary to open a new factory covering an area of five acres to cope with the demand. A large number of electric fires are on view, representing a great variety of designs and finishes. These are fitted with the "Crater" fire bar. This is a 1-kW unit and has a steel back, which renders it practically unbreakable. The wire is so arranged that the bar gives an appearance of a glowing mass. Among the other domestic appliances shown are a number of electric kettles, most of which are fitted with a protector device which automatically cuts off the current should the kettle be allowed to boil dry. This device is fitted with an easily-renewable fuse. A 10-gallon electric wash boiler is exhibited, and other exhibits are fires, boiling rings, toasters, warming plates, &c., as well as samples of the tube and tube fittings made by the company.

The Relay Automatic Telephone Co., Ltd.

This company is providing the automatic telephone service for the administration at Castle Bromwich. It has a complete 50-line private automatic branch exchange equipped for 30 lines. This comprises an automatic switchboard, a power board, a manual section for using in connection with the public exchange calls, a 24-V accumulator battery and various types of telephones. The switchboard is built on the expanding book-case system; it consists of an iron frame into which relay groups are fitted in multiples of 10. The groups can be increased as required without interrupting the service. The only moving parts in the relay switchboard are small armatures, which have a maximum movement of 1/32 in. There are no electro-mechanical switches or other mechanical devices in the system which require constant adjustment, oiling, or cleaning. On the company's stand a "code calling" device is also installed. This apparatus is designed to enable anyone who is absent from his room and is wanted, to be located immediately. The system is an electrically-operated signal service, which sounds a call for the wanted person throughout the premises. The installation shown is capable of making 25 different calls; a motor generator supplies the ringing current.

Electricars, Ltd.

Two new designs of electric industrial trucks appear on this firm's stand. One is of the elevating platform pattern, and the other a small three-wheel runabout suitable for use in congested areas and along narrow gangways. The platform truck has a capacity of 2 tons, an overall length of 9 ft., and a width of 3 ft. The platform can be raised or lowered 4 in. Steering is applied to all four wheels. Only one motor is used; this drives by silent chains, through a selective dog clutch, either the running or elevating gear as required. The clutch is inter-connected with the controller and a "dead man" switch, so that the motor is automatically stopped on the completion of either raising or lowering the platform. The truck is propelled by an overhead worm-driven axle, and the power is transmitted to the driving wheels through bevel gears mounted on and around the stub axle swivel pins. The gears are totally enclosed and run in oil. The battery has a capacity of 225 Ah. The smaller truck is built to carry one ton. It is 7 ft. long and 2ft. 4 in. wide, and it has a 3-in. lift. The driving and steering are done through a single leading wheel of large diameter, into which the motor is built. The carcase of this may be said to form the hub spindle around which the wheel revolves, driven through suitable reduction gear by the revolving armature. The movement of the platform is operated by hand.

The Cable Accessories Co., Ltd.

This exhibit is divided into two sections, devoted to cooking and heating respectively. In the cooking section there is a comprehensive range of cookers in excellent finishes catering

Fig. 5.—The "Study" Fire.

for the requirements of families up to 10 persons. There are four models—the largest has a total loading of 7,250 W. It has a hot cupboard, a grill, and two large and one small boiling plates. The oven space is 16 in. wide, 16 in. deep, and 14½ in. high. The smallest type, the "Revo" bungalow cooker, has a total loading of 2,500 W, and is equipped with a single plate or grill. In this case the cooking space measures 12½ in. by 10 in. by 10 in. A special type of boiling plate is fitted to these appliances, known as the "Revotherm." This is a semi-enclosed plate embodying many new features. In it the advantages of the open-type plate have been retained and the disadvantages overcome by the introduction of enclosed plate principles. Efficiency is assured by long steatite insulators through which the heavy gauge resistance wire passes,

to make actual heat conducting contact with the grid shaped top plate. In the fire section there is a large assortment of radiators of distinctive design, most of which are fitted with the "Revo" "Emitter" fire bar. This component incorporates the parabolic reflector principle; the surface of the fireclay unilluminated by the radiant coil, is reduced to a minimum, doing away with the dark patches on the face of the bar when the fire is in operation. Heavy section, self-aligning plug-in contacts are provided to facilitate the changing of the fire bars. The general design of the "Emitter" bar is a bowed fireclay former of heavy cross section, traversed by five parallel troughs of parabolical form, the axis of each being tilted slightly upwards from the horizontal, projecting heat rays in the most useful direction. These troughs house the heavy resistor in correct focus. Support is obtained by means of integral webs of fireclay of minimum width, so that in effect the coil lies in a continuous trough and at correct focus at all points along its length. The life of the coil is lengthened by the low current density at which it is worked. A typical application of this fire bar is illustrated in fig. 5. This is the "Study" fire, in which two of the bars, *i.e.*, 2 kW, are fitted.

Petters, Ltd.

The main exhibits on this stand are a 16/20-b.h.p. twin cylinder marine engine and reverse gear, and a 12/14-b.h.p. stationary "S" type cold starting crude oil engine. The marine engine works on crude fuel oil and paraffin and has no magneto. It is a slow-speed medium-compression engine and is claimed to be very reliable and economical in fuel consumption. The stationary engine is also a surface ignition engine without magneto, and is made in sizes ranging from 5 to 36-b.h.p. A general purpose unit for use on farms or in smaller applications, is the 5-h.p. "Handyman" engine shown. An example of the company's "Petter Light" plant which is suitable for country house installations is shown; a substantial battery is provided with this set, and a switchboard possessing all the instruments necessary for the efficient operation of the plant by persons with no electrical knowledge.

"Manda" Motors, Ltd.

Small motors and their applications are displayed upon this stand. There is a range of these machines from 1/20th h.p. to ¼ h.p., d.c., series shunt and compound-wound, operating at any speed from 1,000 to 2,500 r.p.m. A number of new a.c. motors of a similar range, single and polyphase, high and low voltage, are also shown. An a.c. high-pressure rotary converter for radio use is another exhibit. This apparatus enables the h.p. battery to be charged without complicating circuits which are used for l.p. battery charging. The machine gives ⅓ A at 70 V. Several exhaust fans appears with from 10-in. to 48-in. blades. Other applications of small motors are an electric turntable and buffing, polishing and grinding machines. There is a collection of starting and regulating switches for use with these motors.

The Edison Swan Electric Co., Ltd.

This company has a varied collection of its many electrical products. Particular attention is devoted to "Royal Ediswan" lamps, and examples of all types, *e.g.*, carbon filament, vacuum, and gasfilled. The "Fullolite" lamp of opal glass with an inner protective skin of clear glass, is given prominence. Another interesting lamp made by the company is the "Pointolite," which has a bulb housing a tungsten arc. This lamp has many applications, including kinema projection work, and in laboratories where a point source of light is required. The company also has a large display of electrical accessories, including lampholders, switches, junction boxes, fuse boxes, distribution boards, &c. Another section is devoted to domestic electrical appliances, and here are shown the "Little Glutton" vacuum cleaner, irons, kettles, toasters, and other devices. A further part of the exhibit consists of a representative range of "Ediswan" radio valves.

Other Exhibitors.

In addition to the foregoing, which are only a few of the electrical firms, brief mention must be made of the following exhibits, and more space will be devoted to most of them in a later issue:—

Geo. Ellison (switchgear); The B.S.A. Radio, Ltd. (wireless apparatus); Reeves & Co. (electrical accessories); Imperial Engineering Co. (cooking, heating, &c., appliances); Mouldensite, Ltd. (moulding powders and impregnating varnishes); Veritys, Ltd. (motors, starters and lighting fittings); Coley & Swinnerton, Ltd. (cookers, wash boilers, &c.); Steam Fittings Co., Ltd. (valves, regulators, &c.); Blackstone & Co., Ltd. (oil engines); Vickers-Petters, Ltd. (heavy-oil engines); G. Turnock (cable connectors, charging boards, &c.); S. J. Daulby (d.c. motors); C. H. Parsons, Ltd. (switches and lampholders); Tangyes, Ltd. (oil engines and pumps); Commutator Grinding Block Co.; Lightfoot Refrigeration Co., Ltd. (ice-making and refrigerating machines); British Electrical Repairs, Ltd. (generator repairs, &c.); London Electric Wire Co. and Smiths, Ltd. (wires and cables); Julius Sax & Co., Ltd. (alarms, signalling apparatus, &c.); W. E. Burnand & Co. (electric motors and furnaces); W. & T. Avery, Ltd. (weighing, recording and testing machines); Automatic Electric Furnaces, Ltd.; Alfred Herbert, Ltd. (machine tools); Belling & Co. (cooking and heating apparatus); Rapid Magnetting Machine Co., Ltd. (electro-magnetic separators); National Time Recorder Co., Ltd. (recorders and costing machines); British Electric Transformer Co., Ltd. (cookers, fires, &c.); Higgs Motors (dynamos, motors and parts); J. H. Tucker & Co., Ltd. (electrical accessories); Tok Switches, Ltd. (snap switches and plugs); Jackson Electric Stove Co., Ltd. (heating and cooking apparatus); Magnetic Separators, Ltd.; Electric Heating & Hardware, Ltd. (electric fires and domestic appliances); the Arora Co. (electric fires); W. McGeoch & Co. (switch and fuse gear, signalling lamps, &c.); E. H. Millington & Co., Ltd. (lighting fittings); S. A. Lamplugh, Ltd. (radio apparatus); Smith & Paget (electric washing machines); Henry Watson and Sons, Ltd. (electric lawn mower); Eastern Telegraph Co., Ltd.; Holden & Hunt (electric welding plant); Allen-Liversidge, Ltd. (welders and riveters); Babcock & Wilcox, Ltd. (lighting sets); Bowen Instrument Co. (electrical pyrometers); Waygood-Otis, Ltd. (model lift); Sheringham Daylight Co.; Atomised Fuel & Engineering Co., Ltd.; Rustless Surf-Alloy, Ltd. (low-voltage furnace); Hackbridge Electric Construction Co., Ltd. (transformers); R.M.P., Ltd. (mica); the Electrolier Co. (lighting fittings); Spauldings, Ltd. (insulating materials); Record Electrical Co., Ltd. (instruments); Francis Lamplocks, Ltd.; Birkby's (synthetic resins); Dowsing Radiant Heat Co., Ltd. (heating, cooking, &c., appliances); Premier Electric Heaters, Ltd. (domestic appliances); Bulpitt and Sons, Ltd. (electrical utensils); Bastian Meter Co., Ltd. (geysers, meters, &c.); Berry's Electric, Ltd. (switchgear, fires, &c.); Gent & Co., Ltd. (radio apparatus, clocks, and signalling gear); Siemens & English Electric Lamp Co., Ltd. (lighting fittings and domestic appliances); Siluminite Insulator Co., Ltd.; National Gas Engine Co., Ltd. (crude-oil engines and generating sets); Crossley Bros., Ltd. (oil engines and a new lighting set); Young, Osmond & Young, Ltd. ("Lightfoot" heating system); A. W. Beuttell & Co., Ltd. ("Linolite" fittings); Hewittic Electric Co., Ltd. (mercury arc rectifier and "Service Light"); Ruston & Hornsby, Ltd. (cold-starting oil engines, &c.); "Ceag" Miners' Supply Co., Ltd. (miners' lamps); "M.K." Electric, Ltd. (plugs and sockets, switches, &c.); and K.F.M. Engineering Co., Ltd. ("Internalite" signs).

The London Fair.

The London Section of the Fair is housed in some of the buildings of the White City, Shepherd's Bush; it comprises many hundreds of firms, covering a wide range of classes, but the electrical industries are here represented mainly by wireless apparatus. The following firms are exhibiting:—Ashley Wireless Telephone Co., Ltd.; Beard & Fitch, Ltd.; Brandes, Ltd.; British Radio Corporation, Ltd.; British Thomson-Houston Co., Ltd.; S. G. Brown, Ltd.; Burndept Wireless, Ltd.; J. J. Eastick & Sons; Elven Mains Receiver Co.; Finston Manufacturing Co., Ltd.; Formo Co.; General Electric Co., Ltd.; Gilfillan Bros., Ltd.; Halcyon Wireless Supply Co., Ltd.; Lisenin Wireless Co.; London and Provincial Radio Co.; Magonee Specialities, Ltd.; Marconiphone Co., Ltd.; Marconi's Wireless Telegraph Co., Ltd.; M. O. Valve Co., Ltd.; Mullard Wireless Service Co., Ltd.; North London Valve Co., Ltd.; Peerless Productions, Ltd.; Permec, Ltd.; Radio Communication Co., Ltd.; Read & Morris, Ltd.; Red Seal Loud-speakers; Sexton-Barnes, Ltd.; Stratton & Co., Ltd.; Telegraph Condenser Co.; Wates Bros. & Co., Ltd.; Watmel Wireless Co., Ltd.; Western Laboratories, Ltd.

General Electric Co., Ltd.

This company's exhibit (Stand No. C. 48), is in four sections —"Osram" valves, "Gecophone" wireless receiving sets, installation components and accessories, and "Witton" moulded insulation. Every type of the well-known "Osram" valve is shown, both receiving and transmitting, including the dull emitter types, to which the D.E.2 (h.f. and l.f.), have recently been added. The "Gecophone" section ranges from the "Junior" crystal set to the six- and eight-valve superheterodyne receiving sets, covering one, two, three, and four-valve sets. Amongst installation components and accessories are the "Gecophone" low-loss slow-motion variable condenser, the new "Gecophone" l.f. transformer, and the "Gecophone" universal filament rheostat.

Mullard Wireless Service Co., Ltd.

Over a dozen types of receiving valves are displayed by this company, including the P.M.3—a general-purpose valve—the P.M.4, P.M.6, D.F.A.6, D.F.A.7, D.F.A.8—dull-filament power amplifiers, which are recent additions. The dull-filament valves, P.M.3, P.M.4, and P.M.6, have filaments of extremely high emissivity, taking only 0.1 amp.; in the case of the P.M.3 and P.M.4, the filament is of "N" shape and is therefore said to be nearly equivalent to three valves in parallel. The P.M.6 possesses an "M" filament, equivalent to four valves in parallel. These features give rise to the high mutual conductance claimed for these valves. The company produces a large number of types of transmitting valve, ranging from 5 watts up to 30,000 watts. Amongst them there are some interesting additions. The D.0/40 is a dull emitter transmitter capable of handling a dissipation of 40 watts at the anode. Also the new D.F.A.6, D.F.A.7, and D.F.A.8 (offered as power valves for handling very large outputs) are efficient low-power dull emitter transmitters. The transmitting valves from 5 watts to 600 watts are in glass envelopes; above this power the envelopes are of silica. The 30-kW valve is of the water-cooled metal-glass type. Amongst the company's most recent productions is a wire-wound anode resistance made in standard values up to 100,000 ohms.

Legal.

Metropolitan Tunnel and Public Works, Ltd., v. London Electric Railway Co.

In the Court of Appeal, before the Master of the Rolls and Lords Justices Scrutton and Sargant, on February 8th, this case was heard upon the appeal of the defendants from the refusal of Mr. Justice Lawrence in the Chancery Division to stay the proceedings in the action (commenced by originating summons, under Section 4 of the Arbitration Act, 1889). It appeared from the statement of Mr. C. E. Jenkins, K.C., for the appellants, that the matter arose under a contract between the parties entered into in May, 1924, for the execution of some tunnelling work by the plaintiffs for the defendants on the Charing Cross to Kennington extension. Counsel said the contract in question was what was known as a "schedule of prices" contract by which the contractors agreed to execute the work in question for about £395,000. The defendants had already paid to the plaintiffs about £270,000 on the certificates of the defendants' engineer, but a question arose with reference to the *interim* payments to the contractors by the defendants on the certificates of the engineer and the contractors' right to have recourse to what was referred to as the "general contingencies account" or fund in the contract. Counsel contended that Mr. Justice Lawrence had wrongly exercised his discretion in refusing to stay the proceedings under the arbitration clause in the contract. Mr. Owen Thompson, K.C., having supported the decision of Mr. Justice Lawrence on behalf of the contractors, their Lordships, by a majority (Lord Justice Sargant dissenting) allowed the appeal and stayed the proceedings, and the matter in dispute was therefore remitted to the arbitrator.

The defendants were awarded the costs of the Court below and of the appeal.

Traveller Sent to Prison.

William Thomas, 31, traveller and general dealer, of Walworth, found guilty of feloniously receiving 17 wireless valves and two sets of transformers, the property of Messrs. Pettigrew and Merriman, of Tooley Street, was sentenced at the London Sessions on February 9th to three months' imprisonment in the second division.—*The Times.*

Thefts of Radio Material.

At Old Street Police Court, on Saturday, Cecil H. Quinton, warehouse foreman, pleaded guilty to a charge of stealing a l.f. transformer and a condenser, value 21s. 8d., the property of his employers, Messrs. Hobday, Limited, from a warehouse. The prosecution stated that a director of the firm went to defendant's address and found between £250 and £300 worth of radio components. They found at defendant's address a number of receipts for things he had purchased at Hobdays, but these receipts only covered a very small number of articles.

Defendant was, up till a few weeks ago, one of the men employed to search other employés. Holding that position he was not himself searched. Defendant said he had been driven into the position by force of circumstances. In his previous situation he had a number of assistants under him, and he had to show a surplus for the goods that he handled. For several years he was able to show a large surplus. His remuneration was £3 per week and a commission payable at the end of the year. Owing to shortage of stock to which everyone else had access, he was thrown out of employment, and was not paid his commission. Prisoner was sentenced to three months' imprisonment, with hard labour.

Theft of Electricity.

At the Cardiff Police Court, on February 11th, George F. Cooksley, managing director of G. F. Cooksley & Co., Ltd., electrical engineers, Cardiff, was charged with the fraudulent abstraction of electricity, valued at £1 7s. 3d., from the Corporation's mains. For the prosecution it was stated that the defendant took a room which was not equipped with electric lighting. He then engaged an electrician to make a connection to the lighting mains under the floor of the office. The energy thus obtained was used for lighting and later for heating, and was charged to the principal occupant of the premises. Defendant pleaded guilty, and the magistrates imposed a fine of £10, or, in default, two months' imprisonment.

Southport Corporation v. Birkdale District Electric Supply Co., Ltd.

Lords Birkenhead, Atkinson, Sumner, Wrenbury, and Carson, on February 12th, delivered judgment in the House of Lords in this case, it being an appeal from a judgment of the Court of Appeal reversing a judgment of Mr. Justice Astbury upon a question of charges for electricity supply.

The Birkdale Company supplies electricity in the old Birkdale urban district, now included within the Borough of Southport, and the Corporation of the latter town objecting to the company's charging a higher price within its area of supply than the Corporation did in its own area, brought an action with a view to restraining it from doing so. Mr. Justice Astbury dismissed the action, but the judges in the Court of Appeal, in reversing his decision, granted an injunction restraining the company from charging more, so the company appealed to the House of Lords, asking that Mr. Justice Astbury's finding might be restored. Their lordshops unanimously dismissed the appeal.

Lord Birkenhead said the appellants relied strongly on a well-established principle of law, that if a person or public body was entrusted by the Legislature with certain powers and duties expressly or implicitly, for public purposes, those persons or bodies could not divest themselves of these powers and duties. They could not enter into any contract or take any action incompatible with the due exercise of their powers or the discharge of their duties. In none of the authorities cited was this principle questioned. The problem was throughout, on the facts proved, to bring the case within the principle.

The case of the York Corporation *v.* Leatham was somewhat severely criticised in the Court of Appeal. The facts of it were peculiar, and having regard to this peculiarity he regarded that case as distinguishable.

Lord Wrensbury pointed out that in the York case there was a contract between those who controlled the statutory undertaking and a third party as to the price to be charged, but there was no such contract here, the contract being only between the District Council and the company which was taking a transfer of the undertaking. Lords Atkinson, Sumner and Carson concurred, and the appeal was dismissed.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Electrical Commercial Travellers.—The Electrical Trades Commercial Travellers' Association, which was formed about a year ago, held its first annual dinner, at the Manchester Hotel, London, E.C., on Saturday evening last. Mr. C. W. Sully was the chief guest, and Mr. E. A. Joyce occupied the chair. There were many toasts, including "The President and Vice-Presidents," proposed by Mr. A. S. Markes, and responded to by Mr. Sully and Mr. V. Dale. "The E.T.C.T.A. and Chairman" was proposed by Mr. Sully, and responded to by Mr. Joyce. Mr. Sully said that the Association had already done a good deal of useful work. When they came together at meetings like that, they got all the advantages of co-operation and understood the individual points of view of each other. He congratulated them upon the success of their first year's work, and referred to the social and educational advantages of associated activity. Mr. Joyce, in replying, said that they intended to make the Association a power in their daily work; there was no limit to the benefits that they could secure. They had made a start with their Employment Register. It was within their possibilities to be able to advise companies with regard to members' agreements. They would welcome recruits, and he threw out a hint in favour of fraternising with other societies. Other toasts were "The Charities," "The Visitors," and "The Officers." The toast, "The Press," was proposed by Mr. L. Moir, one of the Press secretaries, who thanked the Press for the assistance that it had given the Association since its inauguration, and coupled with the toast the name of Mr. A. H. Bridge (Commercial Editor of the Electrical Review). Mr. Bridge, in responding, congratulated the Association on the success that had attended its operations down to date, and said that it should occupy an increasingly important place among electrical associations as its membership grew. He said that they must not imagine that editors were always writing. Nowadays they spent much of their time talking, and in his case during nearly 35 years in the editorial chair he had had to listen to the troubles of large numbers of electrical travellers. This being so, he was impressed not only with their difficulties, but with the great value which such an association might be to members if it became a large organisation. He had witnessed the birth of most of the electrical organisations, excepting the Institution of Electrical Engineers. Some had died, others had become a great power in the land, and while organisations filling different purposes were not comparable, he thought that there was a place for their body to become a real power for the commercial man. In his pre-journalistic days he had been closely connected with the commercial engineering trade, and had to do with the sending of travellers to South America. In those days orders were as easy to pick up as stones and sand. To-day things were very different. If they looked round the electrical industry they would see men practically at the top who 30 years ago began life as commercial electrical travellers. That circumstance should give encouragement to those present in considering the wonderful future that lay before our electrical industry. The speaker went on to

some of the problems that had been put to him from time to time—troubles between commercial travellers, between travellers and their employers, requests for advice as to whether under stated circumstances it was worth while going to law, whether such and such a salary offered for a post advertised in the ELECTRICAL REVIEW would be sufficient if they went to take up a job at Timbuctoo, Salt Lake City, or Jericho; whether it was safe to go without an agreement; whether there were risks of being landed in India out of a job and without means of getting home. These were typical questions upon which they could centre their thoughts as an association. Communications should be addressed to the Hon. Secretary, Mr. R. F. Norris, 25, Hamlet Gardens, Ravenscourt Park, W.6. The subscription is only 10s. 6d. per annum, this low figure being made possible by the fact that all officers have been rendering devoted voluntary service.

Electricity at the Ideal Home Exhibition.—Messrs. L. G. HAWKINS & Co., LTD., inform us that they have again secured the favourable position which they held in past Ideal Home Exhibitions. One of the features of their stand will be a model electric kitchen in which special demonstrations will be given by Alderman Mrs. Hammer and Mrs. Pearmain, of Hackney. There will also be a good show of lighting fittings and domestic appliances.

Admiralty Electrical Engineers' Pay.—An award of the Industrial Court was issued last week on the salary scales of electrical engineers employed by the Admiralty at headquarters, at the Royal Dockyards, and elsewhere. The Court fixed the following basic salaries—*i.e.*, salaries exclusive of cost of living bonus:—

Assistant electrical engineer—£310 a year, rising by annual increments of £15 to £475; electrical engineer—£475, rising by £25 to £650; senior electrical engineer—£575, rising by £25 to £725. Electrical engineers appointed as senior electrical engineers will enter the higher scale at their existing salaries or at the minimum of the scale, whichever is the greater. Engineers and senior electrical engineers will continue to be provided with a house or house allowance, and the special allowance of £75 a year to senior electrical engineers will be discontinued.—*The Times.*

Co-ordination of Overseas Propaganda.—In a recent letter to the Prime Minister the Federation of British Industries points to the necessity of co-ordinating propaganda for British interests in oversea countries. So far, it is said, every question has been dealt with separately by a separate body, and it is thought that this divided effort should give place to a more effective method. The F.B.I. therefore suggests the appointment of an inter-departmental Government Committee upon which representatives of industry, commerce, finance, shipping, science, arts, education, and other interests should be invited to serve with a view to co-ordinating British propaganda abroad.

Social Events.—The annual dinner of the staff of the Torquay Electrical Department was held on February 6th. The toast of "The Undertaking" was proposed by Mr. H. F. G. Woods, the borough electrical engineer, who referred to the progress made during the past year, particularly with regard to domestic consumers. A musical programme followed the dinner and toasts.

The first annual dance and social of Preston Corporation Electricity Department Sports and Social Club took place on February 10th, over 900 persons attending, including the president, Mr. W. S. Wood (Ribble power station superintendent) and members of the Corporation.

About 120 members and friends gathered to celebrate the first social evening arranged by the Sheffield Illumination Society, held at Stephenson's Restaurant, Sheffield, on the 9th instant, when Councillor W. Melling (chairman of the Lighting Committee) presided. Councillors M. Humberstone, J.P., and S. Warren were also present. Councillor Melling made reference to the greatly improved street lighting of the city since the appointment of a public lighting engineer, and said that Sheffield had been further honoured by Mr. J. F. Colquhoun (public lighting engineer) being asked to deliver a paper at the Conference of the Institution of Public Lighting Engineers, to be held at Newcastle in September next. Whist was followed by musical items and after supper the musical programme was continued.

The annual staff dance of the Paisley Corporation Electricity Department was held on February 5th at the Town Hall. The function took the form of a whist drive and dance, and, at the conclusion of the whist drive, domestic electrical appliances were presented to the winners. The chief electrical engineer and his wife (Mr. and Mrs. Blair Smith) were present, and representatives of a number of local electrical firms also attended.

The Hackbridge Cable Co.'s Sports Club is holding its annual dinner at the White Hart Hotel, Mitcham, on March 13th.

Local Exhibitions.—ENNISKERRY (Co. WICKLOW).—Under the auspices of the Enniskerry Electric Supply Co-operative Society, an exhibition of electrical appliances was held recently in the Carnegie Library and the show was largely attended. Mr. S. P. O'Byrne gave a demonstration and a lecture on the utility and economy of electrical domestic appliances.

BACUP.—At the Mechanics' Hall, Bacup, on February 12th, a week's exhibition was opened by the chairman of the Corporation Electricity Committee, the Mayor (Alderman H. Whitehead) presiding over a large attendance. All kinds of electrical appliances are shown for cooking, lighting, washing, heating, &c., and an electric café and lounge have been installed.

The Amendment of the Bankruptcy Law.—It is reported that the Board of Trade hopes to deal during the present session of Parliament with the law of bankruptcy by the introduction of a Bill based on the report of the Departmental Committee issued last year. In the main the recommendations of the Committee have been accepted. It is proposed that acts committed within twelve months of the presentation of a petition may be made criminal offences, instead of within six months as at present. The books that must be kept will include accounts of all goods sold and bought and sufficient details of the goods and their buyers and sellers to enable them to be identifiable. The Committee also suggested that courts of summary jurisdiction should have power to inflict up to twelve months' imprisonment for a bankruptcy offence, instead of six months as at present, and that in certain cases the maximum punishment should be increased to five years' penal servitude.

Lead.—Reporting on February 13th, Messrs. James Forster & Co. state:—"A little better demand from consumers has been experienced this week, though it still leaves much to be desired. Prompt supplies are still plentiful, but arrivals during the next few weeks are expected to be on the light side. . . . It may be that before long we shall have to absorb surplus American lead, as well as the bulk of the Mexican output. The Board of Trade returns for January show:—Imports, 26,898 tons; exports, 2,355 tons; leaving for home consumption 24,543 tons."

The International 48-hour Week.—Last week a meeting of the Executive Committee of the International Metal Workers' Federation was held in Prague. Mr. J. T. Brownlie, the English representative, moved a resolution expressing satisfaction at the action of the British Minister of Labour in inviting representatives of Continental Governments to a conference upon the institution of the 48-hour week in the engineering industries of those countries, and urging all organisations connected with the Federation to bring all possible pressure to bear upon their Governments to give effect to the Washington Convention recommendations. The Federation, which represents nearly 5,000,000 European metal workers, adopted the resolution.

Engineering Employés' Wages.—In commenting upon the refusal of the employers in the engineering industry to concede the union's request for an increase of 20s. per week in the wages of their members, the *A.E.U. Monthly Journal* (February) says:—"We suggest to Sir Allan Smith and his colleagues that they have not met the claim of their workpeople in the spirit in which their proposals to reduce wages were received in 1921. At that time, we were asked to accept cuts in wages, hitherto unprecedented, in order to assist the employers to bring about revival in the industry, and whilst never agreeing that reducing wages would bring about what the employers desired in the way of improved trade, nevertheless our members accepted the cuts and have continued to make the heavy sacrifices imposed upon them. We firmly believe that the engineering industry generally is in a position to meet an advance of wages to the men engaged therein. If employers hold the view that their employés are to wait until every section of the industry is in a flourishing condition before an increase can be granted, then they are wrong, and signs are not wanting that the patience of our members is at last giving way. During the past month, disputes of no small dimensions have taken place in London and other parts of the country—disputes which we submit would never have taken place had it not been for the feeling which is existing that we are not having a fair deal."

E.D.A. Conferences.—The subject of the E.D.A. Conference which is to be held at Caxton Hall this evening (Friday) is "The Electrical Industry and the Architect," and an architect (Mr G. Blair Imrie, of Messrs. Imrie & Angell) will deal with the matter authoritatively. The next conference, which was to be held on March 19th, has been postponed until March 26th.

Bakers' Exhibition at Birmingham.—The Lord Mayor of Birmingham opened the annual Bakers', &c., Exhibition at Bingley Hall, Birmingham, on February 9th, and it remained open until February 18th. The exhibition was noteworthy for the amount of electrical equipment on view. The Artofex Engineering Works, Ltd., displayed an all-electric equipment, making and baking various foods as required for the modern confectioner. This comprised a three-deck sectional portable type electric oven, with proofer and steam generator; mixing and kneading machines, and a 4-speed "Express" cake mixer. The General Electric Co., Ltd., exhibited an electric baking oven, a portable and self-contained appliance designed to secure ease of operation and continuous working. A good deal of electrical equipment, as used in the bakery, was shown by the Hobart Manufacturing Co., Ltd. Messrs. Alfred Hunt, Ltd., exhibited portable ovens fitted with electric light in the baking chambers. Russell & Co. displayed several whisking machines, a mixer, with motor drive, &c. Electrical advertising signs were shown by the Roto-Sign Co., Ltd., and electrically-heated toasters, grillers, and steamers and poachers, were exhibited by Messrs. W. M. Still & Sons, Ltd., and the "Finnell" system of electric scrubbing was demonstrated by Messrs. W. Robert Wright, Ltd.

American Loan for Italian Electrical Enterprises.—It is understood that arrangements have been virtually concluded with a group of American bankers for the issue of a loan of $20,000,000 to the Italian Credit Institute for the development of hydro-electric enterprises in Italy. The bonds will probably bear interest at a rate of 7 per cent.—*Reuter* (New York).

Unemployment.—There was a further reduction of 25,827 in the number of registered unemployed during the week ended February 1st, the total at that date being 1,175,000. As compared with the corresponding date of last year there was a decrease of over 63,000.

Trade Announcements.—The Electric Wiring and Repair Co. has opened a new showroom and offices at 5, Corn Exchange Street, Cambridge. Manufacturers are asked to send new lists to that address.

Mr. Alan Wright, Sentinel House, Southampton Row, London, W.C.1, has been appointed sole sales representative for Great Britain and Ireland for the radio products of the Hart and Hegeman Manufacturing Co., of Hartford, Conn., U.S.A. A 24-page illustrated price list has been received.

Messrs. Crosland & Bateson, electrical engineers, have opened showrooms and works at 15, Cemetery Road, Heckmondwike.

Mr. L. G. Walker informs us that he is organising a contracting business under the title "West Wales Electric, Ltd.," at 3, High Street, Criccieth. He asks for lists and particulars from manufacturers.

The Athol Engineering Co., of Higher Broughton, has acquired new works at Seymour Road, Crumpsall, Manchester, where it will have a greatly increased output of radio components.

Owing to the re-organisation of affairs in this country, Mr. F. W. Lowenadler has resigned his connection with Messrs. Trelleborg Ebonite Works, Ltd. Pending completion of arrangements communications should be addressed to the company at Audrey House, Ely Place, London, E.C.1.

Mr. A. Moreton Scales, late manager of Kye, Ltd., has entered into partnership with Mr. W. R. Preston, and is carrying on a wholesale electric lamp trade, under the title of Lunar Electrical Co., at Sicilian House, Southampton Row, W.C.1.

The Lancashire Dynamo & Motor Co., Ltd., announces that Mr. G. E. Whitehead does not now act as its agent in South Wales, and that it will shortly be opening an office in Cardiff to deal with both Lancashire and Crypto machinery.

The address of the Croydon Borough Electricity Department is now: Electric House, 38, High Street, Croydon.

Messrs. G. S. Peckham & Co., of 4 and 5, New Compton Street, London, W.C.2, have been appointed London agents for Messrs. Cox-Walkers, Ltd., Darlington.

With reference to the announcement in our issue of February 5th of the death of Mr. E. B. Turner, of Turner Bros., 134, Upper Thames Street, E.C., we are asked to state that the continuity of the business will be in no way interfered with. Mr. S. W. H. Turner is the new principal.

Catalogues and Lists.—Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—February stock list of dynamos and motors.

Messrs. Royles, Ltd., Irlam, near Manchester.—Illustrated pamphlets dealing with liquid strainers, air-heating plant, calorifiers, bath-water heaters, steam traps, &c.

Messrs. F. Gilman (B.S.T.), Ltd., Grange Works, Grange Road, Smethwick.—Illustrated catalogue of "Skatoskalo" electric and other scaling tools for boiler and ship work.

Materiel Electrique Alex Lefebvre (Export Dept.), 9, Rue Arsène Houssaye, Paris.—A stock list of generating sets, motors, and other electrical plant

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Folder B.C. 3991, containing details, illustrations, and prices of "Gecophone" radio components and accessories.

Siemens and English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—A well-illustrated catalogue containing prices and details of "Siemens-Xcel" domestic electrical appliances.

Superlamp, Ltd., 92-94, Paul Street, Great Eastern Street, E.C.2.—Net trade price lists of electrical and radio materials and accessories.

Messrs. Crompton & Co., Ltd., Chelmsford.—Leaflets No. 761, describing the "Unique" cell-testing voltmeter, and No. 762, dealing with the "Alltest" multi-range portable moving coil instrument.

The Consolidated Pneumatic Tool Co., Ltd., 170, Piccadilly, W.1.—A series of illustrated pamphlets:—S.P. 109, Portable air compressors; S.P. 110, Electric arc welding; S.P. 111, "Little Giant" combination hoist; and S.P. 112, Vertical power-driven air compressors.

Messrs. Falk, Stadelmann & Co., Ltd., 83-93, Farringdon Road, E.C.1.—Catalogue No. 565, illustrating and describing enclosed lighting units and "Holdrite" suspension sets. Priced.

Mr. John Cashmore, Great Bridge, Staffs.—A catalogue of machinery and plant in stock, including electric motors, boilers, pumps, machine tools, &c.

Messrs. Ferranti, Ltd., Hollinwood, Lancashire.—Pamphlet Ta159/1, illustrating and describing a 450,000-V testing equipment for a cable factory.

The English Electric Co., Ltd., Queen's House, Kingsway, W.C.2.—Publication No. 364A, describing the company's asynchronous-synchronous motors. The booklet also deals with applications of these machines.

Bankruptcy Proceedings.—J. R. Barker, Fanshelf House, Front Street, Pontefract, and 183, Kirkgate, Wakefield, late Gillygate, Pontefract, wireless dealer.—The receiving order in this matter was made on January 11th on debtor's own petition. The liabilities are returned at £221, and there is a deficiency of £129. The first meeting of the creditors was held on January 25th, at the Official Receiver's office, 21, King Street, Wakefield, when the case being a summary one, was left with the Official Receiver as trustee of the estate. The following are creditors:—

	£		£
Albion Electric Stores	24	Carter, R., & Co. (Bradford), Ltd.	21
The British Wireless Supply Co. (1924), Ltd.	38		

The public examination was held on February 11th at the Court House, Wakefield. Debtor attributed his failure to lack of capital, bad trade due to general depression, and loss through a workman. He commenced business at Gillygate, Pontefract, two years ago with £4 capital. He stated that wiring done by a casual workman whom he employed had been condemned and the job was a total loss. The examination was closed.

W. J. Ayling, 2, Rosemont Villas, Ballards Lane, North Finchley, electrical engineer.—The receiving order in this matter was made recently on a creditor's petition. The statement of affairs shows liabilities of £1,052, against assets of £7, leaving a deficiency of £1,045. Debtor attributed his failure to being unable to obtain money owing to him by a limited company. In 1900 he commenced business as an electrical engineer at Carlton Road, New Southgate, with £40 savings, and subsequently occupied premises in turn at Friern Barnet, Crawford Street, Tally-Ho Corner, Poland Street, and High Street, Edgware. In July, 1920, he paid his creditors a composition of 7s. 6d. in the £ on liabilities of £90. In March, 1923, he removed to High Street, Edgware. On November 10th, 1924, he promoted a private limited company, to whom he transferred his business for a consideration of £1,000 payable as to £250 in cash, £250 in fully paid £1 preference shares, and £500 in 2,000 fully paid 5s. ordinary shares, the company taking over his liabilities except a debt of £300 for money borrowed. He was appointed managing director of the company, and spent the greater portion of the £250 he received in cash in meeting claims for wages and materials on behalf of the company. He states that there is now £394 due to him which he regards as irrecoverable. The company is still carrying on business, but he states that the shares are of no value. He became aware of his position in March, 1925. The following are creditors:—

	£		£
Branchli, C.	200	St. Helens Cable & Rubber Co., Ltd.	20
Griffiths, W.	90	Ayling, A.	20
Beaumont, W. (Exors. of) ...	85	McConnell, W. J.	330
Nicholls & Clarke	65	North, D. T.	20
Abrahams & Co.	40	Wagner, C. W.	20
Pearce, W. J.	35		

N. A. Ludwin, trading as N. A. Ludwin & Co., Merchants, 122, Bunhill Row, E.C. The public examination of this debtor was held on February 13th, before Mr. Registrar Francke, at the London Bankruptcy Court, the accounts showing total liabilities of £10,850 (unsecured £8,690), and net assets valued at £1,382. In the course of his evidence, the debtor stated that he had dealt chiefly in hardware and radio goods; he had also acted as managing director of various companies carrying on similar businesses. In September last he was convicted at the Central Criminal Court upon charges of conspiracy and obtaining goods by false pretences, and was sentenced to six months' imprisonment in the second division. Witness attributed his insolvency to depreciation in the value of German currency, to loss of goods removed from store without his authority, and to loss of goods confiscated by the Customs authorities. The examination was concluded.

P. W. Horne, radio dealer, trading as Horne Bros., Borough Road East, Middlesbrough.—This bankrupt underwent his examination at the Middlesbrough Bankruptcy Court on February 12th. His gross liabilities were £4,028, of which £3,807 was expected to rank for dividend. His assets were put at £254, leaving a deficiency of £3,552.

Debtor admitted that he knew very little about the business, but his brother, who was an experienced electrical engineer, had a shop, and gave him the opportunity of taking it over. He denied that his brother was a partner in the business despite the title of the firm. The title was his brother's suggestion. He removed to more suitable premises at a cost of £300, which money he borrowed from relatives. He continued in business because he hoped the wholesale part of the trade in the town, which was keeping the retailer from selling, would ultimately finish. The trade generally were up against a particular wholesaler, and trying to put him out of business.

The Official Receiver suggested that the debtor had come very largely to his present position by spending too much. The examination was adjourned to March 5th.

W. R. Grigsby (Wenham Lighting Corporation), electrical factor, 184, Grays Inn Road, W.C.—Last day for proofs for dividend, February 23rd. Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C.1.

H. Hall, wireless dealer, 26, Egerton Street, and late of 6, Market Place and Albert Chambers, Radcliffe, Lancaster.—First meeting, February 19th, at the Official Receiver's offices, Byrom Street, Manchester. Public examination, March 16th, at the Court House, Bolton.

J. F. CARR, electrical goods agent, 89, Aston Avenue, Fallowfield, Manchester.—First meeting, February 16th, at the Official Receiver's offices, Byrom Street, Manchester. Public examination March 12th, at the Court House, Manchester.

F. H. ARMITAGE, electrical engineer, 9, Occupation Lane, Pudsey.—Receiving order made February 4th, on creditor's petition. First meeting, February 19th, at the Official Receiver's offices, 12, Duke Street, Bradford. Public examination, March 8th, at the County Court, Bradford.

C. F. WADE, consulting engineer, 2, Cambridge Arcade, Pinstone Street, Sheffield.—First meeting, February 17th, at the Official Receiver's offices, Figtree Lane, Sheffield. Public examination, February 25th, at the County Court, Sheffield.

C. G. HOFMAN (W. J. Chambers & Co.), wireless components manufacturer and electrical engineer, Andrew Works, Calthorpe Road, Wandsworth Road, and 7a, Victoria House, South Lambeth Road, S.E.—Application for discharge to be heard at Carey Street, W.C., on March 5th.

G. J. C. THORNE and A. H. THORNE (Lawrence Trading Co.), electrical engineers, 51, Avondale Square, S.E.1, late of 159, High Street, Notting Hill Gate, W.—First and final dividend of 4½d. in the £, payable at Carey Street, W.C.

A. H. MONCRIEFF, wireless manufacturer, late of 197, Anerley Road, S.E., and 60, Thornton Road, Bradford.—First and final dividend of 1s. 2d. in the £, payable February 20th, at the Official Receiver's office, 12, Duke Street, Bradford.

W. P. YOUNG (W. P. Young & Co., and Leicester Tanning Machinery Co.), mechanical and electrical engineer, 172, Kimberley Road, and 40 and 42, Sanvey Gate, Leicester.—Supplemental dividend of 2½d. in the £, payable February 23rd, at the Official Receiver's office, 1, Berridge Street, Leicester.

Company Liquidations.—RE-ECHO RADIO CO., LTD., 109, Marsham Street, Horseferry Road, S.W.1, manufacturers of receiving sets and accessories.—A meeting of creditors was held on February 10th, at the offices of Mr. C. H. Whatley, Duke Street, W.C., the liquidator appointed in the voluntary liquidation of the company. A statement of affairs was presented which showed liabilities of £911, all due to unsecured creditors. There were debentures for £900, and there was also a contingent liability of £124, claimed by Marconi's Wireless Telegraph Co., Ltd., for royalties, which was at present in dispute. The net assets were £604, leaving an estimated deficiency of £307 The company was registered in September, 1924, being a reconstruction of the Re-Echo Manufacturing Co., Ltd., which was wound up by the Court. The new company purchased the assets of the old company from the receiver. The capital of the present company was £2,500. It appeared from the books that a very fair business was done up to March, 1925, but from April last until January of this year trade had fallen off considerably The present position was attributed to insufficient capital, heavy overhead charges, and the slump in trade. It was hoped that the business could be sold as a going concern, and if that was done sufficient would be obtained to pay the creditors in full. Mr. Whatley stated that if the liquidation was continued with the present liquidator the debenture holder would fall in with the general body of creditors and rank as unsecured. After some further discussion it was decided that the shareholders of the company should be requested to pass resolutions appointing Mr. E. H. Hawkins, of Messrs. Poppleton, Appleby & Hawkins, accountants and auditors, 4, Charterhouse Square, E.C., as joint liquidator with Mr. Whatley, together with a committee of inspection of three of the largest creditors. The following are creditors :—

	£		£
Marconi's Wireless Telegraph Co., Ltd.	254	Cobalt Magnet Steel Co., Ltd.	38
Universal Cabinets, Ltd. ...	101	Kent Bros. Electric Wire Co. and E. H. Phillips, Ltd. ...	38
Odhams Press, Ltd.	73	International Electric Co., Ltd.	30
Coan, Robert W., Ltd.	63	Thompson & Norris Mfg. Co., Ltd.	21
Fry's Metal Foundries, Ltd. ...	57		
Lowenadler, F. W.	52		

THE VAUXHALL CHEMICAL CO., LTD., 161a, Upper Kennington Lane, S.E.—Under a compulsory winding up order against this company, the business of which was to place on the market a chemical compound for the charging of batteries, the statutory first meetings of the creditors and shareholders were held on February 11th at Carey Street, W.C. The accounts showed liabilities of £2,056 against assets valued at £412, and a total deficiency of £2,644 with regard to contributories. The Official Receiver remains in charge of the liquidation.

VICTORIA ELECTRICAL (MANCHESTER), LTD.—Winding up voluntarily. Liquidator, Mr. R. N. Brookes, 6, Princess Street, Manchester.—A meeting of creditors was called for February 18th, at Victoria Works, Altrincham. Particulars of claims to be sent to the liquidator by March 1st.

Dissolutions of Partnership.—ERIC JOHNSON & Co., general electrical and mechanical engineers, 134, Old Street, Ashton-under-Lyne.—Mr. J. W. Webster and Mr. E. Johnson have dissolved partnership. Mr. Webster will attend to debts.

LAIRD, HYDE & HYAM, electrical engineers, Hill Cross, Coventry.—Messrs. G. A. Laird, D. Hyde, and T. H. Hyam have dissolved partnership. Messrs. Laird and Hyde will attend to debts and continue the business.

BLAXLEY CABLES, electrical engineers, 230, High Street, Erdington, Birmingham.—Mr. E. E. Peace and Mr. F. H. Blaxley have dissolved partnership.

B. C. BULLARD & Co., electrical engineers, 13, Museum Street, Ipswich.—Mr. B. C. Bullard and Mr. C. W. Tozer, junr., have dissolved partnership. Mr. Bullard will attend to debts and continue the business under the same style.

J. K. COTTON & Co., electrical engineers, 2, Water Street, Rochdale.—Messrs. F. W. Brierley, J. Sugden and A. D. Wickham have dissolved partnership. Debts will be attended to by Messrs. Brierley and Sugden, who will continue the business.

HODDINOTT & Co., electrical factors, 19, Cannon Street, Manchester.—Messrs. H. Hoddinott, A. Dale and G. E. Bayley have dissolved partnership. Messrs. Dale and Bayley will attend to debts.

Book Notices.—"What's Wanted and Advice to Inventors" (1st Edition).—A useful booklet issued by the Institute of Patentees (Inc.), price 7½d. post free, containing many suggestions for the guidance of prospective inventors. A few short articles, including "Patents and the Income Tax," by S. E. Denning, F.I.S.A., and "The Legal Aspect of Patents," by Kenneth E. Bartlett, add to the interest of the publication. The aims and objects of the Institute are also given in detail.

"The *Electrician* Electrical Trades Directory and Handbook." (Pp. civ + 1,417.) London: Benn Bros., Ltd. Price, 25s. net.—This is the 44th edition of this useful directory. The usual features appear, having been brought up to date.

"Art and Commerce." Winning essays in *The Studio* international prize competition; together with an article on "The Organisation of Commercial Art in the United States," by Harry L. Sparks. (8 pp.) London: *The Studio*, Ltd.

"The *Journal* and Record of Transactions of the Junior Institution of Engineers." Vol. XXXVI, Part V, February, 1926. Price, 2s.

"Technologic Papers of the U.S.A. Bureau of Standards." Vol. 19, Nos. 298 and 299, October, 1925 (10 and 20 cents respectively).

"Circular of the U.S.A. Bureau of Standards." No. 1, October, 1925.

"The *Journal* of the Institute of Transport." Vol. 7, No. 4, February, 1926. Price, 2s. 6d.

"The Annual Report and *Transactions* for the 41st session, 1924-1925, of the Derby Society of Engineers."—The Society has now a membership of 225.

"The *Journal* of The Royal Technical College," No. 2, December, 1925. Price, 10s. 6d.

"The Transactions of the South African Institute of Electrical Engineers." Vol. XVI, Part 11. December, 1925. Price, 2s.

"Notes on the Induction Motor," by H. E. Dance. Pp. viii + 152; figs. 70. London: Oxford University Press. Price, 6s. net.

"Who's Who in Architecture (1926)." London: The Architectural Press. Price, 25s. net.

"The National Significance of Electricity." London: British Electrical and Allied Manufacturers' Association (Inc.).—A brochure reprinting four articles which have appeared in the financial Press, dealing respectively with the electrical industry, the national supply of electricity, the Government's electricity schemes, and standardisation.

The Timber Market.—Our Timber Trade Correspondent reports that the wood market for softwoods from the North of Europe, for general construction purposes, is fairly steady, but the country is holding heavy stocks. This latter position is set off to some extent by the better consumption which, it is expected, will improve still further in the early future. Competition on the spot is rather keen. In hardwoods the teak market continues very firm, with stocks light and a paucity of shipments to come forward. Of mahogany logs, those of prime quality and good size are firm in value, but for inferior grades the market has weakened a little. Mahogany planks and boards are highly valued. In other choice hardwoods, such as satinwood, ebony, rosewood, &c., the market is firm. For American oak, ash, walnut, and other woods, the market is steady, due largely to the high ideas of shippers for forward business. Stocks, generally, of States hardwoods are large, and the demand only moderate.

Early Church Lighting.—Messrs. Falk, Stadelmann and Co., Ltd., have been informed by one of their customers that he has recently re-wired Blockley Parish Church, Worcestershire, with the company's "Hitest" lead-covered cable on the "Esyway" system. The customer states that the church was the first in this country to be wired for electric lighting.

New Italian Companies.—Among the new concerns recently formed in connection with the electrical engineering industry in Italy are the Società Industria e Applicazioni Elettriche, Milan, capital 10,000 lire; the Società Astese Filovie Elettriche, Asti, capital 10,000 lire; and the Società Industrie Elettriche, Carolei (Cosenza), capital 600,000 lire.

Hackney: A Contractor's Protest.—The borough electrical engineer of Hackney (Mr. Robinson) recently invited the Hackney and Stoke Newington Chamber of Trade to compete for prizes offered for the best window-dressing displays in the four show-cases in the Electricity Demonstration Halls. An electrical contracting member of the Chamber was invited to take part, but at the last meeting a letter was read in which he resigned his membership as a protest against the action of the Chamber in working with the Borough Council instead of protecting the interests of the individual members. The letter described municipal trading as nothing more or less than the beginning of Bolshevism (surely it began a very long time ago!), but it did not take into account the assistance which the Council's Demonstration Hall is lending to the general extension of electricity supply in the district or the convenience of the service rendered by the Department to the small consumer. The Hall is situated a considerable distance

from the contractor's own shop premises. The Gas Company has a fine showroom in the neighbourhood, and if electrical contractors cannot make displays on such a scale they must be content to see such electricity halls as that in Mare Street. If electrical development can only proceed at the pace it merits there will be work for both contractors and municipalities.

An Index of Consumers.—The Hackney Electricity Committee has considered the question of keeping records of development in the Sales Department and has recommended the introduction of a card index of consumers so arranged that the names of all consumers can be seen on the visible edge of the card on which numbers are printed. These numbers would represent lighting, heating, cooking, power, &c. By the use of coloured transparent signals it could be seen what part of the business required most development in any particular road, and what business had been obtained. This system also lends itself to the classification of trades, which is needed for circulating invitations to lectures, demonstrations, &c. Alderman Genese, in moving that the proposal be referred back, stated that he was opposed to the municipal sale of electrical appliances. He mentioned that the Council had secured a monopoly of a vacuum cleaner, and local retailers were compelled to purchase these appliances from the Council in order to supply their customers. The amendment that the scheme be referred back was lost.

Radio Apparatus in Poland.—*Commerce Reports* says that increased activity in the radio field prevails in Poland. A broadcasting station is being erected in Cracow, and an ex-Prime Minister, in conjunction with the Polish electrical firm of Sila & Swiatlow has been granted a concession to build a station and manufacture and sell radio equipment. Foreign capital participates to a considerable extent in this departure, and the combination is to take over the Government factory which produces telegraph and telephone apparatus.

The Business Efficiency Exhibition.—The Business Efficiency Exhibition, organised annually by the Office Appliance Trades Association, was opened by Sir R. Woodman Burbidge, Bart., on February 10th; it closes to-morrow (Saturday). As in previous years, all kinds of office aids are in evidence, including many electrically-operated machines such as typewriters, calculating machines, time recorders, and duplicators. Intercommunication systems are exhibited by the Reliance Telephone Co., Ltd., Dictograph Telephones, Ltd., and the British Home and Office Telephone Co.

Egyptian Railway Contracts.—The Metropolitan Carriage Works has been awarded a contract by the Egyptian State Railways for the supply of one thousand open low-sided 10-ton wagons. Messrs. Dorman, Long & Co. have been awarded a contract for the supply of 100,000 steel sleepers, and Messrs. Guest, Keen & Nettlefolds have secured a similar contract. The contracts for two further lots of 100,000 steel sleepers have not yet been placed.—*Reuter's Trade Service* (Cairo).

Trade Facilities Acts Extended.—The period under which guarantees may be extended to British traders in the carrying out of projects which employ British materials was to come to an end on March 31st next. The Government has decided, however, to extend the period for a further year and to increase the aggregate amount which may be guaranteed from £70,000,000 to £75,000,000. It is estimated that at March 31st next £5,000,000 of the original sum will remain unused; therefore, the total balance available will be £10,000,000.

The Overseas Trade Acts are to be extended also. The total of guarantees under these is to remain at £26,000,000, but the dates by which they must be granted and beyond which they cannot remain in force are to be extended to September 8th, 1929, and September 8th, 1933, respectively.

Electric Traction in Brazil.—The *Monthly Review* of the Bank of London and South America, Ltd., states that the English Electric Co., Ltd., has presented a proposal to the State Government of Sao Paulo for the electrification of the Cantareira Tramway at a cost of 11,197 contos of reis (about £1,260,000). A concession is being sought to construct and operate an electric line from Sao Paulo to Santos for the transport of passengers and goods. The State Government of Sao Paulo has granted a concession for an electric railway from Espirito Santo do Pinhal to Caracol, a distance of 21 km. The Cia. Electro-Metallurgica de Ribeirao Preto has asked the Government for a subsidy of 3,000 contos for the construction of a railway line between Ribeirao Preto and the Rêde Sul Mineira Railway. The Paulista Railway has completed the electrification of its lines from Campinas to the Tatú station and is proceeding with the conversion of the Rio Claro line.

For Sale.—Victoria Park Hospital, Bethnal Green, invites offers for surplus generating plant. Kingston-upon-Hull electricity department invites offers for surplus generating plant. Mr. H. J. Shaw will sell by auction on February 24th, at 13, High Holborn, W.C., stocks of wireless, electrical and telephone goods. Watford Borough Council electricity department has for disposal a Willans turbine with an E.C.C. 1,000-kW alternator. (See our advertisement pages to-day.)

Municipal Retail Trading.—In a pamphlet which it has just issued, the Electrical Contractors' Association characterises municipal electrical trading and contracting as a "threat to the industry." It fears that the precedent set by the granting of full trading powers to the Barrow, Bath and Burnley Corporations last year will be followed in other cases, and calls for co-operation between supply authorities and contractors rather than competition.

Price Increases in France.—As a result of the fall in the value of the franc several of the radio apparatus manufacturing concerns in France have lately found it necessary to advance their prices to the extent of about 20 per cent.

Irish Free State Electrical Exports.—Electrical goods to the value of £7,709 were exported from the Irish Free State during the nine months ended with September last as against £1,985 in the similar period of 1924.

Our Radio Exports.—In the *Wireless Trader* for February 10th, statistics appeared showing the distribution of British radio apparatus exports during 1925. The total value of these (including valves and re-exported goods) was £1,335,087. Our principal customer was Japan, whose share was valued at about £214,000. Australia was next in importance, having taken goods to the value of about £200,000, and was followed by the Irish Free State (£83,000), the Netherlands (£65,000), the United States (£55,000), India (£55,000), Canada (£53,000) and South Africa (£51,000).

Calendar and Salary Schedule.—We have received from the Electrical Power Engineers' Association a wall calendar for 1926, which sets out the basic salaries of power station technical staffs and a cost-of-living variation table.

New French Companies.—La Société Générale des Condensateurs et Appareils de Protection Electrique is the name of a new concern which has lately been organised in Paris (73, Rue Notre Dame des Champs) with a capital of 500,000 fr., to acquire and develop the business of the Société La Protection Electrique Capart-Dubilier.

La Société l'Herault Electrique is the name of a new company which has lately been formed at Laroque (Department of Herault) with a capital of 1,100,000 fr., to acquire and extend the hydro-electric station at Laroque.

La Société des Véhicules et Tracteurs Electriques (Vetra) is the name of a new company which has lately been formed in Paris (186, Rue du Faubourg Saint Honoré), with a capital of 300,000 fr., to construct industrial electric vehicles and tractors.

La Société des Ondes Dirigées is the name of a new concern which has lately been organised in Paris (46, Rue de la Tour) with a capital of 200,000 fr., to manufacture radio and electrical apparatus.

A company has lately been formed in Paris (94, Rue de la Victoire) with a capital of 2 million fr. and the title La Société Industrielle de la Ville et du Port de Tenes (Algerie) to establish a central electricity distribution system in the town and district of Tenes, Algeria.

The Japanese Market.—*Commerce Reports* states that the past year witnessed a great improvement in conditions in Japan. The prospects for immediate sales of electrical, steam and hydro-electric generator units and equipment are extremely favourable owing to the prosperous condition of the electrical power companies and the probability of industrial and other demands. On the other hand, business in radio apparatus is quiet. This is attributed to the lack of variety in the broadcast programmes. There is some dumping of accumulated stocks.

The I.M.E.A. : Change of Address.—The address of the Incorporated Municipal Electrical Association has been changed to: Electric House, 38, High Street, Croydon. Tel.: "Croydon 1152." Extn. No. 3.

Lighting and Power Notes.

Aldershot.—Opposition to Bill.—The Town Council is to oppose the Bill of the Metropolitan Electricity Supply Co. which seeks powers to supply electricity in parts of Surrey, Northants., Berks., and Bucks.

Bradford.—Street Lighting.—The City Council has decided to ask the Sheffield Corporation to allow its street lighting superintendent to advise the Council in the matter of street-lighting improvements.

Clayton.—Electricity Supply.—By invitation of the Bradford Corporation Electricity Committee, representatives of that Committee and of the Urban District Council recently met in private conference to discuss the situation affecting electricity supply to Clayton, for which both the Bradford Corporation and the Electrical Distribution of Yorkshire, Ltd., are seeking powers. The Clayton local authority favours a supply from Bradford. The Council received a letter recently from the Yorkshire Electric Power Co. (an associate company of the Electrical Distribution of Yorkshire, Ltd.), stating that it intends to lay cables in certain parts of Clayton within one month.

Continental.—Holland.—The A.E.G. of Berlin has recently completed a 24,000-kW steam turbo-generator for the power station at The Hague. The set runs at 3,000 r.p.m. and is one of the largest high-speed turbines so far constructed.

Belgium.—The Société d'Electricité de la Campine, has completed plans for the establishment of a large central power station in the New Campine coalfield for the supply of electricity to the provinces of Limbourg and Antwerp.

The authorities of the Province of Liége are to raise a loan of 10 million fr. for the electrical development of the province.

France.—The authorities of the Loire-Inférieure Department have been authorised to raise a loan of 9½ million francs for rural electrification purposes.

At the recent annual meeting of the Société Bethunoise d'Eclairage et d'Energie, of Bethune, it was stated that the

Company was now supplying electricity to 308 villages, with 72,237 consumers, the latter representing an increase of 13,606 during the past 12 months. The Company has now about 860 miles of h.p. cable and 770 miles of l.p. mains in operation.

The authorities of the Department of the Nord have recently voted a credit of one million fr. for the extension of the electricity supply facilities in the rural districts of the Department.

NORWAY.—By the utilisation of the waterfall at Rjukan, the Norsk Hydro-Elektrisk Rvaelstof Aktieselskap is now developed to a total capacity of 240,000 kW, and the plant has a daily output of 5,700,000 kWh. The annual output of the Rjukan hydro-electric plants is now about 2,000,000,000 kWh.

Coventry.—OPPOSITION TO BILL.—The City Council is to oppose the Leicestershire and Warwickshire Power Bill, 1926, on the ground that it contains a clause which does not give sufficient protection to the interests of the Coventry undertaking. It was stated at a recent meeting that the company only proposed to supply in bulk, and would not incur the expense and responsibility of distribution as was the case with the Coventry station, and would therefore set up unfair competition.

Dalkeith.—TRANSFER OF UNDERTAKING.—The Town Council has received the sanction of the Electricity Commission to the proposal to take over the local undertaking of the Electric Supply Corporation, Ltd., on April 1st. The purchase price is £18,000.

Denholme (Yorks.).—ELECTRICITY SUPPLY.—The Urban District Council has decided not to proceed with its application for an Order to distribute electricity, but to support the application of the Electrical Distribution of Yorkshire, Ltd., which has agreed to have the supply available within two years if the Order is granted.

Holmfirth.—LOAN.—The Urban District Council is applying for sanction to the borrowing of £5,000 for electricity extensions.

London.—HAMMERSMITH.—The Electricity Committee has recommended the following revised scale of electricity charges as from the meter readings for the quarter ending March 31st next:—General lighting supplies: (Prepayment), 5d. per kWh; (ordinary), varying from 4½d. per kWh for the first 10,000 kWh per annum to 3d. per kWh for all energy consumed in excess of 50,000 kWh. Industrial power, cooking, and heating, &c., 1.4d. per kWh. Special rates for large consumers of electricity for combined lighting, heating and power purposes. The following two alternative "all in" tariffs for private premises are recommended:—(1) Fixed annual charge of 10 per cent. of the rateable value of the premises, plus 1d. per kWh for electricity consumed; (2) Fixed annual charge at the rate of £8 per kW on the lighting installation only, plus 1d. per kWh consumed.

The borough electrical engineer has submitted a report on the extension of h.p. feeders in the Brook Green, Shepherd's Bush, and Hythe Road districts, and the Committee has recommended that the most satisfactory method is to provide an additional e.h.p. three-phase ring main between the generating station and the Osram-G.E.C. Lamp Works, Brook Green, and to transfer the whole of the load of these premises direct to the 3-phase distribution. It is also proposed to draw in an additional 3-phase feeder between the Osram-G.E.C. Lamp Works and the Wood Lane sub-station, to deal with the additional load at the latter point and to provide connecting cables between this sub-station and the new sub-station to be built on Shepherd's Bush Green, in order that the load in the vicinity of Uxbridge Road may be transferred to this new feeding source. The estimated cost of the complete scheme is as follows:—E.h.p. 3-phase cables, £6,452; mains from Wood Lane sub-station to Shepherd's Bush Green sub-station, £3,582; switchgear, transformers, &c., £4,492.

HACKNEY.—The Electricity Committee has recommended that the seal of the Council be affixed to the petition of the Conference of Local Authorities Owning Electricity Undertakings against the Metropolitan Electric Supply Company Bill, 1926.

ST. PANCRAS.—The Electricity Committee has recommended that application be made for sanction to a loan of £4,000 for laying an additional feeder main into the King's Cross district.

FULHAM.—The Electricity and Lighting Committee has recommended that an expenditure of £11,298 be authorised for extensions of mains, and that application be made for sanction to a loan of £27,539 for electricity purposes.

Motherwell.—LOAN SANCTIONED.—The Electricity Commissioners have sanctioned the borrowing of £4,141 by the Town Council for additional mains required in connection with the supply of electricity to the London, Midland and Scottish Railway Company's sheds and workshops.

Northern Ireland.—LETTERKENNY (Co. DONEGAL).—The Urban District Council is applying to the Local Government Department for sanction to a loan of £8,000 to cover the cost of the proposed electricity scheme. The plant will include two 75-kVA sets, and it is intended that the scheme will be such as to suit immediate change to the national scheme. The system of supply will be a.c., 3-phase, 230 V and 400 V.

Padiham.—ELECTRICITY IN BULK.—At a recent meeting of the Urban District Council, the Lancashire Electric Power Co. complained that, although electricity had been available for some time, the Council had not yet completed arrangements. Councillor Wiggins said the Council had for some time negotiated over a draft agreement under which the Company was to undertake distribution for 21 years. The draft agreement needed modification, and some members of the Council favoured the Council's undertaking its own distribution. He moved that the Council break off negotiations and arrange to distribute electricity itself by taking a bulk supply from the Company. The proposal was approved.

Peterborough.—LOAN.—Application is being made by the Town Council for sanction to a loan of £140,700 for extensions at the generating station. The amount is made up of the following items: Buildings, coal handling plant and other accessories, £79,250; overhead 50-ton crane, £1,754; switchgear and accessories, £8,666; a 6,000-kW turbo-alternator (estimated), £24,000; two boilers and pulverised fuel plant (estimated), £26,330; salary of temporary resident engineer, £700.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

STRATFORD-ON-AVON.—*The Stratford-on-Avon Electricity Co., Ltd.*—Lighting: From 1s. to 10d. per kWh. Heating: From 4d. per kWh for the first 200 kWh and 3d. thereafter, to 3d. per kWh for the first 400 kWh, and 2d. beyond that amount. Cooking: From 2¾d. to 1¾d. per kWh. Power: From 5d., 4½d., and 4d., to 5d., 4d., 3½d. and 2d.

CHASETOWN.—*The Cannock Chase Colliery Co., Ltd.*—Lighting: Quarterly meters, 7d. per kWh; prepayment meters on free wiring system, a rebate of 3d. in the 1s. on all electricity consumed in excess of 10 kWh for the winter quarters and 5 kWh for the summer quarters.

EAST HAM.—Power: All electricity consumed in excess of 12,500 kWh per quarter, from 2d. to 1½ per kWh.

BERMONDSEY.—Lighting: from 5½d. to 5d. per kWh. Power: a reduction of 5 per cent.

FULHAM.—Private lighting: from 4½d. to 4¼d. per kWh. (A corresponding reduction to all slot-meter consumers.) Heating and power: from 1¼d. to 1⅛d. per kWh. Public lighting: from 1¼d. to 1⅛d. per kWh. Power taken under kW system: from £4 10s. to £4 per kW.

CLONMEL (Co. TIPPERARY).—Lighting: From 1s. to 10d. per kWh.

Ripon.—ELECTRICITY SUPPLY.—The Electricity Committee is to interview the Harrogate Corporation, which is prepared to supply electricity in bulk to Ripon. The Committee has agreed to interview representatives of any municipal authority or company on the subject either of bulk purchase, lease of powers for supply and distribution, or by generating electricity by a municipally-owned plant.

Silsden (Yorks.).—ELECTRICITY ORDER.—The Urban District Council, after long negotiations with the Yorkshire Electric Power Co., has decided to apply for an Order of its own, with a view to providing an electricity supply for the district.

South Molton.—ELECTRICITY SUPPLY.—The Town Council has decided to offer no objection to the application of Dr. Purves for a Special Order for the supply of electricity in the borough subject to a clause being inserted in the Order protecting the interests of the Council.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them for the supply by the Wallingford and District Electric Supply Co., Ltd., of electricity in the borough of Wallingford and part of the rural districts of Crowmarsh and Wallingford.

Application has been made by the Slough and Datchet Electric Supply Co., Ltd., for a Special Order authorising it to supply electricity in certain parishes in the rural district of Eton.

Stafford.—LOAN.—The Electricity Committee is applying for sanction to the borrowing of £67,400, made up as follows:—Buildings, £4,400; mains, £29,700; machinery, £33,000. The Town Council has confirmed the proposal.

Stanhope. — ELECTRICITY SUPPLY. — The Urban District Council, at a meeting on February 8th, received a report on the proposed electrification of Weardale, and decided to apply for the necessary powers. It was also agreed that the Council should apply to the Unemployment Grants Committee for a grant toward the cost of the scheme.

Sutton Coldfield.—LOAN.—The Town Council is applying for sanction to a loan of £5,000 for mains and extensions.

Torquay.—ELECTRICITY EXTENSIONS.—The Town Council has applied for sanction to a loan of £990 for transformers and switchgear at the power station in order to convert a portion of the Newton Abbot distributing network from d.c. to a.c. A loan is also to be applied for for the permanent extension of the main sub-station in Upton Valley. The electrical engineer reports that, owing to the increase in consumers, the second new 3,000-kW set will probably only meet the demand for another two or three years, and that at the end of the present year it will be necessary to consider whether power-station extensions involving the installation of a 6,000-kW turbo-alternator shall be put in hand.

United States.—ELECTRICAL DEVELOPMENT.—According to the *Electrical World*, the completion this year of the first section of the Kearney (N.J.) generating plant, which is to be operated by the Public Service Electric and Gas Co. and has been under construction since July, 1923, will add greatly to the capacity of the company's system. The equipment to be installed in the new Kearney station includes five turbo-generators, three of 39,200-kVA capacity, and two of 43,750

kVA each. The first of these generating units has already been put into service, and the second unit will be completed shortly. The first section of the Kearny station will thus have a capacity of 205,100 kVA. The second section, when built, will double this rating. Eighteen steel towers have been erected to carry 132,000-V cables connecting Kearny with the Essex and Marion generating stations. Upon completion of the present project, this linking-up will make available a total capacity of 504,500 kVA, and with the erection of the second section the combined capacity of the stations will be 709,600 kVA, making the generating plant one of the largest in the country.

Walsall.—Electricity Extensions.—With a view to giving a supply of electricity to the institutions of the Walsall and West Bromwich Unions Joint Committee at Great Barr, the Corporation proposes to carry out the necessary extension of mains at an estimated cost of £3,000.

Walton-le-Dale.—Street Lighting.—The Lighting Committee has decided to ascertain the cost of converting the present street lamps from gas to electricity.

West Bromwich.—Scheme Rejected.—The Town Council has rejected a recommendation of the Electricity Committee to spend £17,926 in laying cables in connection with the new scheme of the Joint Electricity Authority for the Midland area.

Yeadon.—Electricity in Small Houses.—The Urban District Council has considered the question of the installation of electric lighting in the Council's houses, and the surveyor has been instructed to obtain data as to cost, &c., and to report with a view to application being made for the sanction of the Ministry of Health to the scheme.

Tramway and Railway Notes.

Brazil.—Sao Paulo.—According to the *Manchester Guardian Commercial*, the Government is to obtain permission from the Federal Government to construct a new port, to extend the track of the Sorocabana Railway to the new port, and to start credit operations abroad so that this programme may be carried out. It is estimated that £7,000,000 will be required to construct and equip the new port and to extend and electrify the Sorocabana Railway to the coast.

Continental.—France.—The authorities of the Department of Ile-et-Vilaine have placed the contract for the electrification of the tramways in Brittany with the Sociéte d'Exploitations Electriques, of Paris, which has already commenced operations. The old rolling stock is to be utilised, and contracts will shortly be placed for nine electric locomotives.

Switzerland.—It is reported from Berne that, although the first stage of the electrification of the Swiss railway system is expected to be completed at an earlier date in 1928 than was at first contemplated, the authorities have decided not to proceed with a further electrification programme at present, as it is considered that the economic position is not such as to permit of increased capital outlay on the railways, and it is also desired to await further results of the cost of working the electrified railways.

Spain.—Plans are being prepared for the construction of an electric tramway between Muchamiel and Jijora, in the Province of Alicante.

Germany.—It is reported from Berlin that a beginning will probably be made this year with the long-projected work of the electrification of the Berlin city and circle railway and the connecting suburban lines. The expenditure on the work is estimated at from £5,000,000 to £10,000,000 and a period of three years would be required to complete the conversion of the total length of 97 miles concerned. A second scheme relates to the suggested conversion of the section between Frankfort-on-Main and Basle. The construction of the power station would involve an expenditure of £1,250,000, and the conversion of the Frankfort-Basle section from £2,250,000 to £2,500,000, while £5,500,000 is estimated as the cost of the provision of the electric locomotives in connection with the provisionally projected electrical equipment of the new Baden main lines.

Dundee.—Purchase Scheme Rejected.—In connection with the Town Council's proposal to purchase the tramway undertaking of the Dundee, Broughty Ferry and District Tramway Co., Ltd., the question was considered at a recent meeting of the Council, when it was decided not to purchase the undertaking, on the grounds of high cost, and the possibility of motor omnibus competition. The proposed purchase price was £85,000.

Glasgow.—Inquiry Committee.—According to the *Electric Railway and Tramway Journal*, the Corporation Tramways Committee on Finance has appointed a special sub-committee to examine the traffic and revenue returns of the various tramway routes on the system. It is to inquire into (*a*) the non-paying routes; (*b*) the decline in the revenue per car mile from 21.31d. in 1920-21 to 17.02d. for the current year; the expansion of the system; the increased mileage run, and the decreased revenue during the period under consideration; (*c*) the increase of the department's financial burdens; and (*d*) the cost of the foregoing matters, and to submit a report thereon with recommendations.

Java. — Railway Electrification. — *Commerce Reports* states that according to recent reports the electrification of the line Manggarai-Buitenzorg has been sanctioned by the Government. Plans for the project are now entirely completed, the execution of the work has already been commenced, and the necessary material will be ordered immediately. It is expected that the electrification of the entire line will be completed in two years. An amount of 100,000 guilders has been appropriated for preliminary work in connection with the electrification of the Poerwakarta-Bandoeng line, which will probably be the next to be electrified.

London. — Blackfriars Station.—Important structural alterations are to be made to Blackfriars station to enable it to be linked up with the public subways and also to improve the facilities for handling the traffic at the station itself. The station entrance is to be widened and will lead to a new booking hall 2,500 sq. ft. in area at the existing bridge level. The rearrangement will also permit of an improvement in the interchange facilities between the District Railway and Southern Railway Company's stations. The passimeter system of booking will replace the present type of booking office. Work on the new station is to start at once and it is expected that it will be completed in nine months' time.

Northern Ireland.—Proposed Electric Railway.—It is understood that a syndicate is about to be formed in Newcastle, County Down, with a view of raising £50,000 capital for the construction of an electric railway to the top of Slieve Donard, 2,076 ft. above sea level. The aim of the promoters is to make the ascent from the southern end of the town, *via* the Millstone Mountain, thence to the south side of Thomas Mountain direct to the summit. It is proposed that the descent should be by another route, *via* the Pot of Pulgrave, thence down the slopes of Drinnahilly on the west side of the town.

United States.—Newark (N.J.).—The *Electric Railway Journal* reports that the Pennsylvania Railroad, the city of Newark and the Public Service Corporation of New Jersey have recently reiterated their willingness to enter upon a programme for the expenditure of $25,000,000 for the construction in Newark of a new union terminal and the laying of a vast network of high-speed surface lines, linking northern and western Jersey with Newark. The scheme includes the abandonment of Manhattan Transfer, the extension of the Hudson Tube system to southern sections of Newark, three double-track steel bridges over the Passaic River to accommodate increased traffic brought about by the transfer from electric to steam locomotives at Newark, and the erection of a Pennsylvania passenger station and steam terminal at Wright Street, in the down-town section of Newark. Transportation systems involved in the plan include steam and electric railway lines, electric surface and subway lines and 'buses. The Public Service Railway and railroad branches have the most definite transportation plan outlined for them. This includes a high-speed surface line into north Jersey and the west of Essex County for the passenger traffic to the Newark terminal.

Telegraph and Telephone Notes.

Czecho-Slovakia.—The Postal Administration displayed great activity in developing the Czecho-Slovak telephone and telegraph systems during 1925. It has linked up important commercial and industrial centres with large towns, connected many provincial towns with existing systems, and created local means of communication, exchanges, &c. From January 1st to December 31st (1925), 226 new inter-urban telephone lines and 183 telephone stations were inaugurated. This year the installation of new international telephone lines—Prague-Paris, Prague-Vienna, and Prague-Cracow—will be proceeded with specially. It is also proposed to extend the Prague suburban telephone system, to install at Moravska Ostrava relay plant (of English construction) for international communication, to put into service the inter-urban telephone exchange at Zizkov, and to establish new exchanges at Prerov, Prostejov, Decin, Zvolen, Nové, Zámky, and Poprad.—*Reuter's Trade Service* (Prague).

Italy.—New Radio Service.—The Società Italo-Radio has recently inaugurated a wireless telegraph service between Italy, Egypt, Palestine, and Iraq.

Japan.—Telephone Installation Cost.—It is reported that in Tokio new telephone subscribers must bear the entire expense of installation, at a cost of from 1,500 to 1,700 yen. With the yen at par this would be about £160 in English money. In this country telephone installation is free.

Marine Radio Operators.—Strike Ultimatum.—A conference between the Association of Wireless and Cable Telegraphists and Mr. J. C. A. Ward, chairman of the Engineering Employers' London and District Association, held at the Board of Trade on February 13th, ended in complete failure to reach agreement. The employers, appreciating that they have exhausted the provisions for avoiding disputes contained in the agreement of April 4th, 1923, and having offered proposals for settlement of the strike, which provided for arbitration on all points arising therefrom, have come to the conclusion that it is essential to rehabilitate the service. Accordingly one month's notice, from February 13th, was given to terminate the agreement of April 4th, 1923, but it will be withdrawn

in the event of the A.W. and C.T. accepting this week the terms of settlement of the present dispute as submitted by the employers through the Ministry of Labour on January 27th. In the event of their non-acceptance, the employers will offer to operators signing on in the United Kingdom employment on conditions suitable to the service requirements.

Post Office Accounts.—1925 FIGURES.—The commercial accounts of the Post Office and returns relating to capital borrowings for telegraph and telephone purposes, for the year ended March 31st, 1925 (issued as a White Paper 175, price 9d.), show that the surplus on the telephone service was £463,006 (against £1,596,917 in the previous year), and that the deficit on the telegraph service amounted to £1,645,525 (against a deficit of £1,270,925 in 1925). Telephone revenue increased by £414,966 to £14,782,229, while telegraph revenue decreased by £165,199 to £4,981,580. The Post Office wireless services resulted in a deficit of £27,915, which, with a further sum of £7,736 for experimental work and interest on capital, amounts to a deficit total of £53,358 for the year. Message fees, &c., provided an income of £164,342.

South America.—TELEGRAPH SERVICE.—It is announced that the South American republics of Ecuador and Colombia have lately joined the Bureau International de l'Union Telegraphiqué.

The Telephone Service.—NEW EXCHANGE.—A new telephone exchange, of up-to-date central battery design, was opened at Hoylake on Saturday afternoon, February 13th.

Transatlantic Telephony.—RUGBY TESTS.—It is understood that two-way radio-telephone tests were carried out between the new Government station at Rugby and New York on, and since, February 7th. The experiment commenced at 4 a.m. and lasted until 7.30 p.m., and the results are stated to be very promising; the conversation was also heard in Australia. Transmission took place at Rugby, and reception from New York was carried out at the Post Office station at Wroughton, near Swindon, being relayed through London to Rugby.

Radio Notes.

International Wireless Conference.—WAVE-LENGTH REDISTRIBUTION.—A European conference, to which delegates of all existing or projected wireless organisations have been invited by the International Wireless Office at Geneva, is to be held on March 25th and the following days at Geneva. The conference will be preceded by a general assembly of old and new members of the International Wireless Union. In the course of the meetings proposals for the allotment of wave-lengths for the different European stations will be put forward, experiments which have been made with this end in view being now practically completed.—*Reuter* (Geneva).

Licences.—PROSECUTIONS.—Fining a man 10s. 6d. with 31s. 6d. costs at Hull, on February 10th, for having an unlicensed crystal set, the stipendiary magistrate said the licence must be obtained before the parts were put together, and whether the results were good or bad. A written reply to a question in the House of Commons points out that since the passing of the Act of last session, proceedings have been instituted in 49 cases; 43 cases have been tried, of which 42 were successful, the fines imposed ranging from 4s. to £20 10s.

Post Office Accounts.—B.B.C. LICENCE FEES.—The commercial accounts of the Post Office and returns relating to capital borrowings for the year ended March 31st, 1925 (issued as a White Paper 175, price 9d.), show that the income from the sale of broadcast radio receiving licences to the public during the year was £599,261, of which sum £472,003 is shown to be payable to the British Broadcasting Co., the department retaining £127,258, which is subject to certain adjustment. During the previous year receipts for licences issued totalled £250,055. Licences of the B.B.C. during 1924-25 are returned at £803, compared with £366 in the previous year. On the expenditure side of the account it is shown that administration expenses at headquarters in respect of the issue of licences were £23,770 (in 1923-24 the figure was £23,560), and issue to the public cost £50,411, against £14,463. The year resulted in a surplus of £54,346, over double the previous figure of £20,729.

The daily Press has lately drawn attention to the ultimate effect of a clause in the Supplementary Broadcasting Agreement which came into operation last year. This clause provides that the Postmaster-General shall have the right to reduce the proportion of the licence fee payable to the B.B.C., according to the number of licences and the Company's expenditure. Also, any surplus, after allowing for the depreciation and obsolescence of plant and a maximum dividend to the B.B.C. shareholders of 7½ per cent., must be surrendered to the Post Office. The Postmaster-General decided to limit the B.B.C.'s total income to £500,000, and on June 31st, 1926, the B.B.C. will find its proportion of the licence fees very much reduced. At the moment licences number approximately 1,850,000, bringing in a total of £925,000 per annum. Under the ruling which has hitherto existed, the B.B.C. would receive £693,750 and the Post Office £231,250. The P.M.G.'s limitation would mean that the Post Office would receive £425,000 and the B.B.C. £500,000, but the Company maintains that it should have a larger share of the licence money.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—SYDNEY.—March 31st. New South Wales Government Railways. One air compressor for Zarra Street power house.

April 21st. Four motor-generator sets and four switch-operating batteries for Hornsby and St. Leonards sub-station. Specifications from Chief Electrical Engineer, 61, Hunter Street, Sydney.

MELBOURNE.—April 7th. City Electrical Department. One 2,000-kW rotary converter, with transformer and accessories,* d.c. switchgear and accessories, and one a.c. control panel.*

April 7th. Victorian Government Railways. One hydraulic plate-bending press.*

Bedford.—March 3rd. Electricity Department. E.h.p., h.p., and l.p. underground cables for 12 months. (See this issue.)

Bristol.—February 25th. Board of Guardians. Electrical fittings for six months. Mr. T. S. Lamb, clerk, St. Peter's Hospital.

Cardiff. — February 22nd. Electricity Department. Twelve months' supply of paper-insulated cables, one 1,500-kW rotary converter, and one 2,000-kW ditto. (February 5th.)

March 8th. One 10,000-kW turbo-alternator and condensing plant. (February 5th.)

Edinburgh.—March 8th. Electricity Supply Department. One 25,000-kW turbo-alternator with condensing plant, or alternatively, one 20,000-kW turbo-alternator with condensing plant. (February 5th.)

Hoyland (near Barnsley).—February 26th. Electric lighting installation at Hoyland Council school. Specifications from Mr. A. Rayner, 151, Cross Hill, Ecclesfield, near Sheffield.

Huddersfield.—February 25th. Town Council. Electrician's work in erection of 45 houses, off Town End, Almondbury (5 blocks). Specifications, &c., from Borough Architect, 26, Ramsden Street.

Hull.—Corporation Electricity Committee. Automatic table telephones and bell sets. (See this issue.)

Leeds.—March 2nd. Tramways and Transport Department. Stores for year ending March 31st, 1927, including electrical sundries. Particulars from Mr. W. Chamberlain, general manager, 1, Swinegate.

Leicester.—Electricity Department. One 18,750-kW, 3-phase turbo-alternator, with condensing plant. (February 12th.)

Leytonstone.—West Ham Union. Alterations to the electric lighting station and the installation of a steam-driven generating set, &c., at the Central Home, Leytonstone. (See this issue.)

London.—ST. PANCRAS.—March 2nd. Electricity Department. E.h.p. switchgear at the Grafton Road sub-station. (February 5th.)

METROPOLITAN ASYLUMS BOARD.—February 24th. Installation of electric lighting at the Upper Southern Convalescent Fever Hospital and the Joyce Green Hospital, Dartford. Installation of kitchen fittings and appliances at the North-Western Fever Hospital, Lawn Road, N.W.3. (February 12th.)

Manchester. — March 22nd. Electricity Department. 3-phase, 420-V sub-station switchgear, 3-phase, 6,600-V and 11,000-V ditto, three 500-kVA static transformers, and one 7,500-kVA forced-air-cooled transformer. (See this issue.)

Newark-upon-Trent.—March 1st. Corporation. Two electrically-driven centrifugal pumps. (February 5th.)

New Zealand.—WELLINGTON.—April 23rd. Public Works Department. 11,000-V metering equipment and switchgear for the Arapuni electric power scheme.*

Oldham.—March 2nd. Electric lighting fittings at Bardsley Conservative Club. Particulars from Mr. E. W. Robins, secretary.

March 8th. Board of Guardians. Electric lamps and fittings. Form of tender from Mr. F. W. Fletcher, clerk to Board of Guardians, Union Offices.

Portsmouth.—Electricity Supply Department. Erection of a steel-frame turbine house. (See this issue.)

Richmond-upon-Thames.—February 22nd. Town Council. Electrically-driven centrifugal pump, with switchgear, &c. Mr. Hugh P. Williamson, water engineer, Riverside.

South Africa.—JOHANNESBURG.—April 12th. S.A. Railways and Harbours. Electrification of Cape Town Suburban Railway. Supply and erection of the overhead equipment of the permanent way and overhead transmission and distribution lines. (February 12th.)

CAPE TOWN.—March 17th. Electricity Department. Electric cables, electric light poles, cross arms, insulators, &c.

MOOREESBURG.—March 20th. Municipal Council. Engine-room equipment, including oil engines and tanks, main generators, motor booster, pumps and air compressor, travelling crane, switchboard, battery and connections, distribution system, instruments, meters, &c.; and house service connections.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Andover.—Town Council. Accepted:—
Installing pump at the water works (£1,617).—Edwards & Armstrong, Ltd.

Australia.—Melbourne.—Postmaster-General's Department.
515 tons h.d. copper wire (£53,327).—British Insulated Cables, Ltd.
Automatic telephone exchange equipment, Canberra (£11,828).—Automatic Telephones, Ltd.

State Electricity Commission of Victoria.
6,600-V and l.p. lead-covered and armoured cables.—British Insulated Cables, Ltd. (£12,525); Johnson & Phillips, Ltd. (£1,347).
Electric lamps (£3,522).—Edison Swan Electric Co., Ltd.
22,000-V and 6,600-V lead-covered single-core cables (£1,342).—Johnson and Phillips, Ltd.

Melbourne and Metropolitan Tramways Board.
Two motor equipments (£6,006).—Metropolitan-Vickers Electrical Co., Ltd.
Air-brake equipments.—Westinghouse Brake Co. (£148); Australian General Electric Co. (£992).

Clarke, Chapman & Co.	£11,919	50,000
Vickers-Spearing Boiler Co., Ltd.	£12,900	50,000

Luton.—Board of Guardians. Accepted:—
Installing electric lighting at the children's home (£78).—E. W. J. Whitelock & Co.

Middlesbrough.—Corporation. Accepted:—
H.p. cable (£2,745).—Enfield Cable Works, Ltd.

Portland.—Water Committee. Accepted:—
Dynamo, cable and lamps at main station (£126).—Smith & Son.

Prestwick.—Town Council. Accepted:—
Nine 300-V lamps of 600 c.p., for the Esplanade (£273).—Ayrshire Electricity Co.

Sheffield.—Tramways Committee. Recommended:—
25 sets "Maley" electro-pneumatic barkes.—Electro-mechanical Brake Co., Ltd.

South Africa.—Durban.—Municipal Council. Accepted:—
2 miles 6,600-V cable (£1,427); 5 tons bare copper wire (£452).—T. Barlow & Sons, Ltd.
385 yd. connecting cable (£218).—British Insulated Cables, Ltd.
10 e.h.p. truck-type switch cubicles (£1,238).—British Thomson-Houston Co., Ltd. Two ditto (£293).—Johnson & Phillips, Ltd.
276 battery plates (£208).—Tudor Accumulator Co., Ltd.
—South African Engineer.

Forthcoming Events.

Diesel Engine Users' Association.—Friday, February 19th. At Caxton Hall, Westminster, S.W. Paper on "Heavy-oil Engine Installations—Choice of Site and Lay-out of Plant," by Mr. G. Porter.

Manchester Electro-Harmonic Society.—Friday, February 19th. At the Albion Hotel, Piccadilly, Manchester. Concert.

British Electrical Development Association Conference.—Friday, February 19th. At Caxton Hall, S.W. At 7.30 p.m. Lecture on "The Electrical Industry and the Architect," by Mr. G. Blair Imrie.

Institution of Mechanical Engineers.—Friday, February 19th. At the Institution, Storey's Gate, S.W. At 6 p.m. Annual general meeting. Paper on the "Measurement of Cutting Temperatures," by Mr. E. G. Herbert.

Junior Institution of Engineers.—Friday, February 19th. At 39, Victoria Street, S.W. At 7.30 p.m. Paper on "Coal-Cutting Machinery," by Mr. S. Reilly.

Institution of Electrical Engineers.—Informal Meeting.—Monday, February 22nd. At the Institution, Victoria Embankment, W.C. At 7 p.m. Discussion on "Some Changing Characteristics in the Application of Electricity to Public Supply," to be opened by Mr. A. F. Harmer.

Institution of Electrical Engineers—(*continued*).
(Irish Centre, Dublin).—Thursday, February 25th. At Trinity College, Dublin. At 7.45 p.m. Paper on "An All-Electric House," by Prof. S. P. Smith.
(North-Eastern Centre).—Monday, February 22nd. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. "Notes on the Testing of Static Transformers," by Mr. J. L. Thompson and Mr. H. Walmsley.
(North-Midland Centre).—Tuesday, February 23rd. At the Hotel Metropole, King Street, Leeds. At 7 p.m. Paper on "The Electrification of the Paris-Orleans Railway," by M. Parodi.
(North-Western Centre, Students' Section).—Tuesday, February 23rd. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Paper on "Electric Winding Engines for Collieries," by Mr. H. Pryce Jones.

Royal Society of Arts.—Monday, February 22nd. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture on "The Production and Measurement of High Vacua," by Dr. C. W. C. Kaye. (Lecture II.)
Wednesday, February 24th. At 8 p.m. Paper on "Domestic Heating," by Dr. Margaret Fishenden.

Faraday Society.—Monday, February 22nd. At Burlington House, W. At 5.30 p.m. Ordinary meeting.

Paisley Association of Electrical Engineers.—Tuesday, February 23rd. At 16, High Street, Paisley. At 7.30 p.m. Debate on "Tramways *v.* 'Buses," to be opened by Messrs. W. R. Bruce and P. Hamilton, Junr.

Institution of Civil Engineers.—Tuesday, February 23rd. At the Institution, Great George Street, S.W. At 6 p.m. Papers on "The Khyber Railway," by Mr. V. Bayley, and on "The Survey and Construction of the Khyber Railway,' by' Col. G. R. Hearn.

Electrical Power Engineers' Association (Midland Division).—Wednesday, February 24th. At the Grand Hotel, Birmingham. At 7.30 p.m. Lecture on "Protective Gear," by Mr. G. L. Porter.

Association of Consulting Engineers (Incorporated). — Thursday February 25th. At St. Stephen's Club, Victoria Embankment, S.W. At 7 for 7.30 p.m. Annual dinner.

Birmingham Electric Club.—Friday, February 26th. At the Grand Hotel, Colmore Row, Birmingham. At 7 p.m. Discussion on "Power Factor Improvement," to be opened by Mr. F. R. Unwin and Mr. F. C. Hall.

Royal Institution.—Thursday, February 26th. At 21, Albemarle Street, W. At 5.15 p.m. Lecture on "The Atom of Light and the Atom of Electricity," by Dr. C. D. Ellis.

Institution of Production Engineers.—Friday, February 26th. At 83, Pall Mall, S.W. At 7.30 p.m. Debate on "Payment by Results," to be opened by Mr. R. H. Hutchinson.

Physical Society of London.—Friday, February 26th. At the Imperial College of Science, South Kensington. At 5 p.m. Ordinary Scientific Meeting.

Notes.

The Electrical Engineers' Ball.—The twenty-second Electrical Engineers' Dance took place at the Hotel Cecil on Friday last, and was in every way a distinct success. The arrangements made by the Executive Committee were admirable, and everything passed off most smoothly and satisfactorily. The company present numbered about 640, practically the same total as at the Ball of 1925. Congratulations are due to the members of the Executive and the honorary secretaries.

Wages in Railway Power Stations.—At a meeting of representatives of the Electrical Trades Union, the National Union of Railwaymen, and the London railway companies held at the Ministry of Labour on Tuesday last, an agreement was arrived at in respect of the power-house men's claim for increased rates. The terms of settlement were not disclosed, but it was announced that there would be no strike.

Coal Resources Research.—In pursuance of the policy of the Department of Scientific and Industrial Research of carrying out the physical and chemical survey of the national coal resources, which is one of the main features of the fuel research work of the Department, a committee has been appointed to deal with the survey of the coalfields of Nottinghamshire and Derbyshire.

The Shannon Scheme.—Some additional technical details of the Shannon hydro-electric scheme are given in the *Irish Trade Journal*. A broad-gauge railway for the transport of materials is to be built from Longpavement Station to the site of the power house at Ardnacrusha, and a narrow-gauge railway is to be extended along the works from Longpavement to the end of the embankments near Killaloe for the delivery of materials and plant, and for transporting earth for the embankments.

The excavation work for the power house, tail and head races will be carried out by huge electrically-operated excavators supplied from a temporary Diesel-engine power station, and it is estimated that ten million tons of earth will be excavated. Most of the tail-race excavation will be in rock. The power house will be of concrete construction comprising the dam, turbine house, and generator and switch house. For conducting the water to the turbines steel penstocks, 140 ft. long and 20 ft. in diameter are to be employed. Three 30,000-h.p. turbine and generator sets will be initially installed. In the partial-development stage the head-race channel will be about 260 ft. wide at the water level, 100 ft. wide at bottom, and 30 ft. deep; it will be capable of delivering 550 cubic metres of water per second with an average speed of 1.5 metres per second. The weir above O'Brien's Bridge will be of concrete with six sluice openings. Two of these will have a sill level 28 ft. below the high-level surface, and will be capable of discharging 34.000 cusecs., and the other four will have a sill level 10 ft. below high-water level, and will be capable of discharging 15 000 cusecs. Inlet works will be constructed at the entrance to the head race above the weir, and will consist of concrete foundations and piers with three wide sluice openings and one ship's gate. By closing the sluices and ship's gates it will be possible to cut off the head race from the river should it be necessary to lower the water for purposes of inspection and repair.

Appointments Vacant.—Foreman jointer, for the Spenborough (Cleckheaton) U.D.C. electricity department. Showroom manager (£307) for the Burnley Corporation electricity department. Junior assistant engineer for the Corporation of Ealing electricity supply department. Shift charge engineer, for the Watford Corporation electricity department. (See our advertisement pages to-day.)

An "All-Electric" Comparison.—The following interesting figures show the costs for a period of 12 months of two houses, one using electricity only and the other using electricity, gas, and coal for all domestic services, on the Sheffield electricity supply undertaking's system. All-electric house: Fixed charge, 10 per cent. of rateable value, £3; energy consumed, 7,647 kWh at 0.5d. per kWh, £15 18s. 8d.; plus 20 per cent., £3 15s. 9d.; total cost £22 14s. 5d., averaging 0.7d. per kWh. Electric, gas, and coal house: Electricity for lighting, 223 kWh at 4d. per kWh, plus 10 per cent. and meter rent, £4 11s. 4d.; gas for cooking, 18,700 cu. ft., £2 18s. 6d.; coal for heating, cooking and hot water (10 tons 2 cwt.), £20 8s. 5d.; total cost £27 18s. 3d.

The figures for the all-electric house, the rateable value of which was £30, represent the costs for the 12 months ending June, 1925, and the electricity, gas and coal figures for the other house, rateable value £24, are the costs for the equal period ending December, 1924.

Fatalities.—An inquiry was held recently into the cause of the accident when A. White and W. Merritt, linesmen employed by the G.P.O., who were working on a telephone pole, fell from a five-storey building on to the "live" railway line near Farringdon Street station, receiving fatal injuries. It was stated that one of the wire stays supporting the pole was perished with rust and that the pole was reported as being unsafe in 1923 and in 1925. A verdict of "Accidental death" was returned, the jury adding the following rider:—"The jury are unanimously of opinion that the renewal of the stays had been too long delayed."

Edward Brushwood, employed at the Stockwell sub-station, received a fatal electric shock on February 11th through some cause unknown. The current was cut off for about 20 minutes, and the L.C.C. tramway service between Brixton and Stockwell was brought to a standstill. An inquest was opened on Monday last, and was adjourned until Tuesday next.

Educational.—KING'S COLLEGE, LONDON.—Amongst the special advanced lectures which are being delivered in the Faculty of Engineering of London University, King's College, is a course of three on "Electrical Sub-stations: their Design and Operation," by Mr. H. Brazil, M.I.E.E. (engineer, City district, Charing Cross Electricity Supply Co.). In order to enable shift engineers and others to attend them, it has been arranged for the lectures to be given twice, as follows:—Lecture I was to be delivered on February 16th and 23rd; Lecture II will be delivered on March 2nd and 9th; and Lecture III on March 16th and 23rd. The fee to non-students is 10s. 6d. for the course.

E.D.A.'s Annual Dinner.—The annual dinner of the British Electrical Development Association is to be held on Friday, March 19th, at the Hotel Cecil, at 7 for 7.30 p.m. The speakers will be Viscount Burnham, C.H., Sir Laming Worthington-Evans, Bart., G.B.E., M.P. (Secretary of State for War), and others.

Harnessing the River Dee.—"The Utilisation of the Potential Resources of the River Dee" was the subject of a recent lecture by Mr. S. E. Britton, electrical engineer to the Chester Corporation, before the Chester Natural Science Society. He said that before water resources could be developed to the best advantage, radical alterations to the legislation which governed the use of water were needed, but before such changes were made, a national principle should be established, based upon a careful consideration of (*a*) the proprietorship of water, (*b*) the precedence of the various interests concerned in water, and (*c*) the character of existing restriction upon the free use and upon the abstraction of water for public and private purposes.

While straightening various bends in the river would assist in relieving floods, in improving the conditions of a particular length of the river for development of power and navigation, a further scheme suggested itself, *i.e.*, impounding some of the flood discharge by the construction of one or more dams across the upper valleys of the Dee or tributaries; the water so impounded could be made use of for a comprehensive water supply scheme, or it could be retained for the generation of power. From Llangollen to Erbistock, hydro-electric power stations could economically utilise the run-off water on 275 days per annum, and from Erbistock to Chester on 235 days per annum. As a result of surveys and levelling, it appeared that the water power of the Dee, between Chester and Llangollen, could be most economically harnessed for the generation of electrical energy by the erection of 16 weirs and hydro-electric installations. It was estimated that they would produce 60,000,000 kWh of electricity per annum. The capital cost of such a scheme would amount to £660,000 and would be capable of earning, by the sale of electricity, £198,000. The yearly working expenses, repayment, and interest on capital, spread over 25 years, would amount to £72,000, *i.e.*, an average cost of 0.288d. per kWh, leaving a profit of £126,000 per annum. The effect of impounding 6,250,000 gallons of water annually, which could not otherwise be economically used, and its discharge when there was a greater demand for electricity than the natural flow would produce, would generate approximately 20,000,000 kWh per annum, which, if sold at an average price of 1d. per kWh, would bring in £80,000, and would be sufficient to repay in ten years impounding works costing £600,000. The possibilities of this scheme for producing power were equivalent to the consumption of upwards of 70,000 tons of fuel per annum. The River Dee appeared to possess potential resources which, if developed in the interest of the common good, would provide water, electricity, and means of access, at a cost which would be a boon to industrial and domestic life, and give facilities and convenience of a magnitude which would surpass the most sanguine hopes of any scheme hitherto promoted. The hydro-electric works at Chester were completed in October, 1913, at a cost of £18,482. At April of last year water power at the weir had been converted into 19,640,000 kWh of electricity, the operating costs amounting to £8,659, an average cost of 0.1068d. per kWh. The annual repayments of the original cost of the scheme had amounted to £12,122, *i.e.*, an average cost of 0.1495d. per kWh; by the use of this water, approximately 38,900 tons of fuel had been conserved.

Birmingham and Midland Electrical Engineers' Ball.—It has been decided to hold the annual ball at the Grand Hotel, Grosvenor Suite, on Friday, November 19th, 1926.

Henley's Dramatic Club and the E.T.B.I.—We are pleased to announce that Henley's Dramatic Club, which has done so admirably during the last few seasons, has promised to give a performance in aid of the Electrical Trades Benevolent Institution. "If Four Walls Told," a village tale in three acts by Edward Percy, will be rendered at King George's Hall, Caroline Street, Great Russell Street, W.C.1, on Thursday, March 4th, at 8 p.m. The tickets will be 10s. 6d., 7s. 6d., 5s., and 3s., all numbered and reserved, and can be obtained from Mr. E. G. King, the Assistant Honorary Secretary, Electrical Trades Benevolent Institution, 98, Grosvenor Road, London, S.W.1.

The Electrical Power Engineers' Association.—At the annual dinner of the Scottish Division of the Electrical Power Engineers' Association at Edinburgh on Saturday last, Mr. F. Proudfoot presided over a company of 90, which included Mr. A. J. Ostler, president of the Association, Mr. R. B. Mitchell, city electrical engineer, Glasgow, and president I.M.E.A., and Mr. A. W. Crompton, of Newcastle.

Mr. E. Seddon, manager of Edinburgh Corporation Electricity Department, proposed the toast of the Association.

Mr. Ostler, who replied, said it was borne in on all technical men that they were really responsible for a great part of the management of modern life. That responsibility was growing every day.

Mr. Crompton, proposing "The Electricity Supply Industry," said the effect of putting into force the Government proposals would be to remove industry from the towns and spread it out throughout the country, and to do something to put agriculture on a better footing. Mr. Mitchell, in replying, said the one bright spot noted recently in the industrial situation was the increase in the exports of electrical goods. The lighting load throughout the country was increasing rapidly. In Glasgow the output for the months of November and December showed an increase over the same months of last year of 24 per cent. They were, he believed, on the eve of a development in industrial heating; he thought there was a remarkable future for that. If the Government electricity scheme was brought to fruition consumers in small, and even medium, undertakings would be able to buy their electricity cheaper than at present. It would have a considerable effect on a large number of the members of that Association if over 400 stations had to be shut down; but these undertakings for the most part would be very small, and he hoped those members of the staff who were displaced would be absorbed—and he did not see why they should not very rapidly be absorbed—in the industry, which would go on from success to success.

Manchester Housing and Housekeeping Exhibition.—A Better Housing and Housekeeping Exhibition is being organised by the *Daily Dispatch* to be held at the City Exhibition Hall, Manchester, from April 9th to May 1st. One of the principal features will be an all-electric home equipped with the latest appliances.

Institution of Mining Electrical Engineers.—In a paper on "Mine Signalling Apparatus and Telephones," read before the London branch of the above Institution by Mr. O. D. Kennedy, the signalling requirements in mines, as laid down by the Coal Mines Act, are outlined and the modern methods and apparatus employed for signalling are reviewed. Varying methods of meeting the requirements of the Act are dealt with, together with the difficulties met with in that direction. In dealing with the advantages and disadvantages of mechanical and electrical signalling, the author said that the work of operating mechanical signals, especially from the bottom of a deep pit, was very hard compared with that of operating an electrical system, also a considerable amount of time was lost in giving the signal by the former method. The parts of a mechanically-operated visual indicator had to be made heavy to withstand the strain of the pull. The arrangement of interposing a switch on the pull wire to operate an electrical dial indicator introduced an element of danger; a signal might not be visually indicated through the pull being too short or the indicating device strained by too long a pull. With electrical signalling a perfectly satisfactory automatic arrangement could be obtained by installing special sending switches. The initial cost of the cable was much higher than that of the ropes required with the mechanical gear, but providing a first-class

quality of cable was obtained it should last for a very considerable period, and the saving in maintenance cost and the time in signalling would very quickly recover the initial outlay. When running a cable down the shaft the mistake was often made of not providing adequate fastenings. It was better to err on the other side, and to provide substantial cleats spaced not more than 60 feet apart throughout the length of the shaft so that the weight was well distributed and a minimum strain placed on the cable. It was an undoubted fact that the varying conditions at different collieries were better met by an electrically operated system of signalling, which was invariably more flexible than the mechanically operated systems.

Institution Notes.

Institution of Electrical Engineers.—At the informal meeting on February 8th Mr. R. J. Mitchell opened a discussion on "Some Modern Applications of Ball and Roller Bearings." He said the manufacture of precision bearings occupied the capital and energies of over 50 firms in Europe and America. The product of this considerable industry was a marvellous example of diversity and range, showing that in engineering there was no best way of achieving a result but that improvement in technique brought into being broad classes of competing types, all of which would have a fair trial in the field of hard use. Since loads on bearings supporting rotating shafts might be either pure journal loads or a combination of journal and axial loads, bearings must be designed to meet one or both conditions. To meet the requirements three broad classes of bearings had been developed—plain ball bearings, spherical double row ball bearings, and plain roller bearings. Many years of experience in the field of general engineering, and in particular in the automobile industries, confirmed that where properly applied the precision bearing left little or nothing to be desired in respect of performance. Some electrical engineers still hung back, however, when the decision had to be made between plain and precision bearings. By using precision bearings the designer was able to ensure not only a close air-gap, but that the air-gap would be uniform around the periphery of the rotor or armature and would remain so for the whole lifetime of the machine. Subsidiary advantages were that commutation was more reliable as chatter was impossible, whilst machines kept cleaner, ran cooler, started more easily, and were slightly more efficient on account of the reduced frictional losses. There were exhibited a number of ball and roller bearings, and Mr. Mitchell showed a quantity of excellent slides illustrating these in service. Mr. A. F. Harmer stressed the importance of clean lubricant, and said the cause of much bearing trouble was bad fitting. Mr. H. Brazil thought ball bearings were excellent on smaller machines. He wondered if the excellent results obtained on tramway motors would hold if the motors ran continually nine hours a day. Messrs. C. Belcher, C. S. Clark, W. A. Erlebach, C. R. Garrard, W. E. Rogers, — Smith, and W. L. Wreford also spoke.

Institute of Metals.—The annual and extraordinary general meetings will be held at the Institution of Mechanical Engineers on March 10th-11th, 1926. The annual general meeting will begin at 10 a.m. on the first day, and the extraordinary general meeting at that time on March 11th. The latter is being called for the purpose of passing a resolution to adopt a new set of articles of association, these being the "Regulations contained in the printed document to be submitted to the meeting." On March 10th the annual dinner of the institute will be held at the Trocadero Restaurant at 7.15 p.m. Among the papers which are expected to be submitted are:—"Some Experiments on the Soft-Soldering of Copper," by T. B. Crow; "The Influence of Gases on Copper at High Temperatures, Part 1," by A. Glynne Lobley and Douglas Jepson; and "The Die-Casting of Aluminium Alloys —A Review of Current Methods," by George Mortimer.

Institution of Heating and Ventilating Engineers.—In his presidential address before the above Institution, Mr. Oswald Stoll said some people thought that the science of heating and ventilating was not sufficiently advanced to be honoured as an art; hence arose what he believed was their greatest drawback. The designers and makers of a steam engine, steam turbine, or electric motor knew that they could buy material with which to manufacture those machines which bore a guarantee. Hence they were in a position to predict, from past experience, the results which would be obtained. The materials used in the construction of buildings varied considerably, and this fact made it much more difficult to obtain definite results. Their scientific knowledge and experience to-day had to be of a high order to enable them to overcome those initial difficulties and to produce the degree of accuracy which was expected. In a paper read before the Institution by Mr. H. G. Cathcart some useful figures as to the consumption of gas and electricity in different institutions were given.

Junior Institution of Engineers.—Mr. W. H. Patchell, M.Inst.C.E., took as the subject of the Honorary Member's Lecture which he delivered to the Institution on February 12th, his visit to some of the power stations in the United States in 1925. His remarks had, for the most part, reference to illustrations shown on the screen. He said that large power stations existed in the U.S.A. because conditions of supply were such that it paid all commercial firms and domestic households to use electricity. The demand was met because large plants were put down in the first place to save labour costs, and ever since that time the engineers had realised that in electricity they had something to sell. The result was that now, although 1921 was a bad year, the difference between kilowatts installed and kilowatts generated was doubling annually. Machines of 50,000-kW capacity were none too big when the load on one system varied by 60,000 kW between a dark day and a light day. It was remarkable that in Great Britain everybody waited for the Government to decide upon a standard frequency. What they did in America was to put in frequency changers, such as the 350,000-kVA machine at Brooklyn, and it paid to do so.

Mr. Patchell said that a comparison of British and American electricity prices was very hard to make, for the same reason that it was difficult even to compare the prices of everyday food. American charges might seem greatly different in different towns but that was because the unit charges were based on a standard rate which might be proportionate in one municipality, for example, to house frontage. The Americans certainly knew that a householder soon forgot his standard charge and appreciated the thought, when he saw his lights on, that they were costing only, say, twopence a unit and not eightpence.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

On Monday last Mr. F. A. B. Lord celebrated the completion of fifty years' connection with the hardware trade in the City of London. Mr. Lord began his career with the firm of W. F. Dennis & Co. when he was a boy, in 1876, and the whole of his fifty years' connection with the hardware, electrical and metal trades has been with that firm, of which he is now the head. In 1877 the firm became the agents in this country for Messrs. Felten & Guilleaume, and this arrangement continued down to the outbreak of war in 1914, when it was suspended until about a year after the cessation of hostilities; it was then resumed, and it remains in existence to-day. Mr. Lord's partners in the firm of W. F. Dennis & Co. are Messrs. J. E. Hood and L. H. Hurburgh.

Ing. Francesco Manfredi has resigned his position with the Società Lombarda per Distribuzione di Energia Elettrica in order to take up the appointment as Director General of the Milan municipal electricity undertaking and to supervise the construction of the new Valtellina power station.

Among the recent nominations as Chevaliers of the French Legion of Honour are M. Dardeau, works director of the Paris underground electric railways and M. Lemon, director of the Société Force et Lumière des Pyrenees.

Mr. J. A. T. Barnes, manager of the Kendal Electricity Works, has informed the Corporation that he accepts an increase of salary to £450 per annum without prejudice to a revision of the matter later.

Mr. H. J. Smith, resident engineer of the North Metropolitan Electric Power Supply Co. in the Hertford, Ware and Hoddesdon district, is leaving to take up a position with the Beds., Cambs. & Hunts. Electricity Co., and will be succeeded by Mr. C. R. Marshall, who has acted in a similar capacity at Chingford Mr. Smith was presented with an engraved casket by the staff on his departure.

Mr. E. F. Darker, the London representative of the Benjamin Electric, Ltd., is shortly leaving for South Africa.

Upon leaving Dartmouth, in which district he has spent 24 years, Mr. G. E. Smith, late engineer and manager of the Urban Electric Supply Co., has been presented by the Dartmouth staff with a pair of binoculars. He is taking up a position in London.

The marriage took place on February 11th, at St. Andrew's Church, Ashley Place, Westminster, of Mr. Aubrey Llewellyn Coventry Fell, C.B.E., of Ryestead Common, Chiddingfold, late general manager of the London County Council Tramways Department, and Miss Florence Ruby Wynn, daughter of the late Mr. T. H. Wynn, of Middlesbrough.

Mr. John L. Griffiths, late of the Lancashire Dynamo and Motor Co., Ltd., Manchester, has been appointed assistant electrical engineer to the East Indian Railway, and is now stationed at Lillooah, E.I.R. (Bengal), India

The marriage took place at St. Thomas Cathedral, Bombay, on January 29th, of Mr. Harold Walter Puttick, A.M.I.E.E., A.M.I.Mech.E., resident electrical engineer, Lillooah, East Indian Railway and Leigh-on-Sea, Essex, and Miss Violet Waring, of Aubrey House, Maida Hill, W.2.

Messrs. Wallis-Jones & Dent have removed their offices to 9, Old Queen Street, Westminster, S.W.1. Their telephone number is unaltered: "Victoria 8070."

The *South African Engineer* states that Mr. Andrew Roberts, elder son of Mr. John Roberts, M.I.E.E., borough electrical engineer at Durban, has obtained his degree of Bachelor of Science in Engineering at the Witwatersrand University, and has taken up an appointment with Messrs. Dougall & Munro, Ltd., engineers and contractors.

Obituary.—Mr. J. Stephens.—The death of Mr. John Stephens, of Millwall, a brief reference to which appeared in our issue of February 5th, has removed from amongst us

another of the pioneers of the electrical industry. In the years 1883 to 1888, Mr. Stephens brought a great deal of knowledge and perseverance to bear upon the problem of making satisfactory lead castings for the plates of storage batteries. He was able, after many trials, to make chills in which to cast plates which were both light and strong In association with the late Mr. Anthony Reckenzaun, he worked out details of a Very light, and what was at that time considered a very efficient, electric motor. Such motors were used for propelling battery driven tramcars and launches. An electric tramcar was built by the firm of Stephens, Smith & Co., of which Mr. John Stephens was the founder, and dispatched to Australia. The same firm built and equipped an electric locomotive for use in a mine, also several electrically propelled launches. One of these launches was supplied to the secretary of the Sultan of Turkey. Another electrically propelled boat was the *Volta*, which in September, 1886, successfully made the trip from Dover to Calais, and back to Dover, on one charge of the accumulators. Motor and equipment were all made by Mr. Stephens's firm. It is recalled that on this voyage a Solan goose, asleep on the sea, was seized by an occupant of the *Volta*, and brought alive to the shore, forming an illustration of the noiselessness of the vessel. Much other pioneer work was done by Mr. Stephens, and the industry owes much to his determination to solve difficult problems.

M. J. PERRETT.—The death is reported from Paris at the age of 56 years of M. Joseph Perrett, the chief engineer of the Société des Forges et Ateliers de Constructions Electriques de Jeumont. The deceased who was well known in the French electrical world commenced his career with the old Postel-Vinay concern, which was later absorbed by the French Thomson-Houston Co.

ING. GALLI.—We regret to learn from Milan that Ing. Galli, editor of the Italian electrical journal *Energia Elettrica*, has passed away.

MR. E. R. HILLS.—The death took place, on February 5th, at the age of 64 years, of Mr. Edward Robert Hills, St. Peter's, Broadstairs, who had for about 25 years been on the staff of the Isle of Thanet Electric Supply Co., Ltd.

MR. W. A. CAVE.—The death took place, on January 5th, at the age of 49 years, of Mr. William Alfred Cave, who had for 23 years been with the Marconi Co. at Chelmsford. For 15 years he was foreman of the Mounting Shop.

MR. J. R. CALDECOURT.—The death occurred on February 6th, at the age of 59 years, of Mr. John R. Caldecourt, who was in business as an electrical engineer in Station Road, Upminster, Essex.

MR. D. S. CAPPER.—We regret to learn of the death, which occurred on February 11th, at the age of 61 years, of Mr. D. S. Capper, who was for nearly 20 years Professor of Engineering at King's College.

Will.—The late Mr. ROBERT SUTTIE, a director of the Glenboig Union Fire-Clay Co., left £36,917.

New Companies Registered.

Certax, Ltd. (211,592).—Private company. Registered February 8th. Capital, £800 in £1 shares. Objects: To carry on the business of manufacturers, importers and exporters of and dealers in all kinds of electrical (wireless or otherwise) machinery, plant, apparatus, appliances and accessories, electricians, &c. The subscribers (each with one share) are:—W. A. Bourdon, 35, Mortlake Road, Ilford, clerk; A. E. Evans, 130, Thurleigh Road, Clapham Common, S.W.12, clerk. The first directors are to be appointed by the subscribers. Remuneration as fixed by the company. Solicitors: Timbrell & Deighton, 90, Cannon Street, E.C.4.

Radio Photographic, Ltd. (211,583).—Private company. Registered February 6th. Capital, £500 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in wireless and photographic apparatus, wireless photographers, &c. The directors are:—S. W. Chetwood, 1, Leopold Avenue, Wimbledon, S.W.19, dental surgeon; C. T. Millns, 10, Clyde Road, Croydon, certified accountant. Secretary: C. T. Millns. Solicitors: Guscotte, Wadham, Tickell & Co., 19, Essex Street, Strand, W.C. Registered office: 5, Lambeth Hill, Queen Victoria Street, E.C.4.

City of London Radio Corporation, Ltd. (211,537).—Private company. Registered February 5th. Capital, £1,000 in 700 10 per cent. non-cumulative preference shares of £1 each and 6,000 ordinary shares of 1s. each. The preference shares take priority for return of capital. Objects: To carry on the business of electrical engineers, manufacturers of, and dealers in wireless and electrical apparatus, machines, accessories, and goods, &c. The subscribers (each with one preference share) are:—R. O. G. Maxwell, 20, Pendarves Road, Raynes Park, S.W.20, traveller; W. Sanders, 3, Cranbrook Road, S.W.19, engineer. The first directors are to be appointed by the subscribers, and may (if so provided in their appointment), retain office for life or for a specified period. Remuneration, £25 each per annum. Solicitors: Lord & Co., 154, Bishopsgate, E.C.

Harko, Ltd. (211,630).—Private company. Registered February 9th. Capital, £500 in £1 shares. Object: To carry on the business of electricians, manufacturers of and dealers in radio apparatus, mechanical, electrical and radio engineers, manufacturers of and dealers in electrical appliances and apparatus, advertising contractors and agents, &c. The life directors are:—A. V. Mead, 4, Chandos Avenue, Chingford Road, Walthamstow, engineer; Dorothy Sheehan, 2, Macdonald Road, Walthamstow. Qualification, 10 shares. Solicitor: P. W. Pardy, 172, Bishopsgate, E.C. Registered office: 172, Bishopsgate, E.C.2.

Fraser Mares, Ltd. (211,629).—Private company. Registered February 9th. Capital, £1,500 in £1 shares. Objects: To carry on the business of electrical, radio and mechanical engineers, marine wireless engineers and contractors, manufacturers of and dealers in wireless apparatus, founders, metal workers, motor engineers and repairers, &c. The subscribers (each with one share) are:—H. Holmes, 98, Frederick Street, Cardiff, moulding manufacturer; A. H. Mares, 9, Waterloo Road, Cardiff, wireless engineer. The first directors are not named. Remuneration as fixed by the company. Secretary (*pro. tem.*): T. A. Tyrrell. Solicitors: Phœnix & Levinson, 8, Dumfries Place, Cardiff. Registered office: 27, Bute Street, Cardiff.

James Gray & Son, Ironmongers and Electricians, Ltd. (13,985).—Private company. Registered in Edinburgh on February 4th. Capital, £20,000 in 10,000 preference and 10,000 ordinary shares of £1 each. Objects: To acquire the business of general furnishing ironmongers, kitchen-range and grate makers and electrical engineers carried on by R. E. Douglas at 89 and 89a, George Street, Edinburgh, as "James Gray & Son." The directors are:—R. E. Douglas, 114, Polwarth Terrace, Edinburgh, ironmonger; A. J. Robertson, of "Stormont," 34, Morton Street, Joppa, ironmonger; J. C. Henderson, 97, Marchmont Road, Edinburgh, ironmonger; R. A. Douglas Elliott, 24, Merchiston Park, Edinburgh, ironmonger. Qualification, 250 shares. Registered office: 89, George Street, Edinburgh.

H. C. Brown, Ltd. (23,997).—Private company. Registered in Edinburgh February 11th. Capital, £1,000 in £1 shares. Objects:—To acquire the business of electrical engineers, motor-car and cycle accessories factors and agents carried on at Kirkwall by H. C. Brown and S. Banks as Brown & Banks. The first directors are:—H. C. Brown, 16, Bridge Street, Kirkwall, electrical engineer; J. J. Chedgey, 16, Bridge Street, Kirkwall, electrical engineer. Secretary: J. J. Chedgey. Registered office: 14, West Castle Street, Kirkwall.

Raphoe Electric Lighting Co., Ltd. (7,460).—Private company. Registered in Dublin on February 11th. Capital, £1,500 in £1 shares. Objects: To carry on the business indicated by the title. The directors are:—John Moffatt, Junr., Diamond, Raphoe, Co. Donegal, draper; Richard Hamilton, Diamond, Raphoe, Co. Donegal, provision and general merchant; Robert Thompson Whyte, Diamond, Raphoe, Co. Donegal, boot and shoe merchant; Hugh Carlin, John Craig, Dr. John English Snodgrass, all of Raphoe. Secretary: John Moffatt, Junr. Registered office: Diamond, Raphoe, Co. Donegal.

Official Returns of Electrical Companies.

Lisbon Electric Tramways, Ltd. (62,983).—Capital, £1,250,000 in 750,000 ordinary and 500,000 preference shares of £1 each. Return dated November 11th, 1925. 634,026 ordinary and 425,553 preference shares taken up. £134,026 paid on 134,026 ordinary shares. £925,553 considered as paid on 500,000 ordinary and 425,553 preference shares. Mortgages and charges, £466,300.

V. G. Middleton & Co., Ltd.—Satisfaction to the extent of £700 on December 31st, 1925, of debentures dated April 29th, 1920, securing £4,000.

Merthyr Electric Traction and Lighting Co., Ltd. ((57,908).—Capital, £100,000 in 6,000 preference and 14,000 ordinary shares of £5 each. Return dated June 18th (filed September 15th), 1925. 6,000 preference and 13,000 ordinary shares taken up. £95,000 paid. Mortgages and charges, £48,400.

A. Behm (London), Ltd.—W. Strachan, of 50, Gresham Street, E.C.2, ceased to act as receiver or manager on February 3rd, 1926.

Thermal Electric Works (Hackbridge), Ltd.—D. Watson, of 88, Alexandra Road, East Croydon, engineer, was appointed receiver and manager on February 4th, 1926, under powers contained in debenture dated January 5th, 1925.

Isle of Thanet Electric Supply Co., Ltd.—Satisfaction to the extent of £1,384 on September 30th, 1925, of charges dated January 18th, 1902, and September 15th, 1924, each securing £150,000.

Specialities (Liverpool), Ltd.—Satisfaction in full by the payment of £360 7s. (the amount due) on October 29th, 1925, of charge dated January 26th, 1924, securing all moneys due or to become due not exceeding £1,000.

Sterling Telephone and Electric Co., Ltd.—Transfer dated January 25th, 1926, of mortgages dated May 15th and September 24th, 1924, securing all moneys due or to become due from the company to the Westminster Bank, Ltd., not exceeding £130,000, charged on all the freehold hereditaments to which the documents specified in the schedule to the mortgage of May 15th, 1924, relate, and the company's undertaking and property, present and future, including uncalled capital, if any.

H. G. Cooper, Ltd.—First mortgage debenture dated January 16th, 1926, to secure £5,000, charged on the company's undertaking and property, present and future, including unpaid capital. Holder: H. G. Cooper, Lawnrise, High Road, Laindon Hills, Essex.

Van Raden & Co., Ltd. (78,383).—Capital, £10,000 in £1 shares. Return dated November 30th, 1925. 6,754 shares taken up. £4,654 paid. £2,100 considered as paid. Mortgages and charges, £6,200.

Red Seal Products, Ltd.—Debenture dated February 3rd, 1926, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: L. Cohen, 33, Westgate Road, Newcastle-upon-Tyne.

L. Weekes (Luton), Ltd.—Particulars filed of £3,000 debentures authorised January 29th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

G. H. Turner & Co., Ltd.—P. M. Harper, of 329, High Holborn, W.C.1, incorporated accountant, ceased to act as receiver and manager on February 3rd, 1926.

G. Davenport (Wireless), Ltd.—M. G. Jemmett, of 30 and 32, Ludgate Hill, E.C.4, was appointed receiver and manager on January 29th, 1926, under powers contained in certain debentures dated August 14th, 1924.

Stearn Electric Co., Ltd.—Issue on January 25th, 1926, of £1,100 debentures, part of a series already registered.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Northampton Electric Light and Power Co., Ltd.

The net revenue account for the past year shows a balance on working of £53,564. To this are added £4,025 brought forward (after paying dividends up to December 31st, 1924), and interest amounting to £2,307, making £59,896. The allocations include £22,284 to the depreciation fund, £4,955 to the reserve fund, £1,000 to the battery suspense fund, and £1,000 to the employés' benevolent fund. The dividends on the ordinary shares total 9 per cent. for the year, as in 1924, and £8,327 is carried forward. Continued progress is reported; during the year the company commenced to supply energy to Daventry,

Weedon, Wolverton, Newport Pagnell, Olney and several villages. The maximum load increased by 26 per cent. to 8,498 kW, and the energy sold rose from 11,729,635 kWh to 14,278,101 kWh. Substantial price reductions were made during the year. The meeting was to be held yesterday (Thursday), and the shareholders were subsequently to be asked to sanction an increase of the company's capital to £500,000 by the creation of 150,000 additional "B" shares to be issued either as preference or ordinary shares.

The "Underground" Group.

The final dividends for the year ended December 31st last have been declared by the companies forming this group, as follows:—

London Electric Railway Co.—Ordinary shares: 1¾ per cent., making 3½ per cent. for the year, as compared with 4 per cent. for 1924. £45,000 is placed to reserve and £94,282 (against £74,506) is carried forward.

Metropolitan District Railway Co.—Ordinary stock: 1¾ per cent., making 3½ per cent. for the year, as for 1924. The reserve receives £45,000 and £51,347 is carried forward, as compared with £69,230 brought in.

City and South London Railway Co.—Consolidated ordinary stock: 1½ per cent., making 3 per cent. for the year, as against 4 per cent. for the preceding year. £25,000 is put to reserve and £25,037 is carried forward (as compared with £18,766).

Central London Railway Co.—Undivided and preferred ordinary stocks: 2 per cent., making 4 per cent. for the year, as in 1924. Deferred ordinary stock: 4 per cent. for the year (the same). £40,000 is transferred to reserve, and £81,008 (as against £85,885) is carried forward.

Underground Electric Railways Co. of London, Ltd.—It is proposed to pay the full interest and dividends on the 6 per cent. first cumulative income debenture stock and the 6 per cent. income bonds, as in 1924. The balance carried forward is £145,959, as compared with £126,685 brought in.

Metropolitan Railway Co.

The statement of accounts for the year ended December 31st, 1925, shows gross receipts of £1,998,979 (as compared with £2,264,040 in 1924), and an expenditure of £1,325,263, leaving a balance of £673,816. To this are added miscellaneous receipts of £306,107 and a balance of £51,127 brought forward, making £1,031,050. Preference dividends, interest, rentals, &c., absorb £600,910, and out of the balance (£430,140) dividends amounting to 5 per cent. are received by the ordinary shares, leaving £51,402 to be carried forward. In the preceding year the ordinary dividend was the same, but in addition £25,000 was placed to the general reserve fund. As we have already reported the dividend on the Surplus Lands Stock was raised from £3 7s. 6d. per cent. to £3 10s. per cent. The report states that the extension to Watford, constructed jointly with the London and North-Eastern Railway, was opened for traffic on November 2nd last. The reconstruction of the Aldgate and Edgware Road stations is in hand and is expected to be completed during this year. It is also hoped to complete new car sheds at Wembley Park to house ten trains of electric rolling stock. Following the ordinary meeting, which was to be held yesterday (Thursday), a further meeting was to be held to approve of the Metropolitan Railway Bill now before Parliament. This provides for the construction of a relief line connecting the Harrow extension line with the Circle line.

St. James' and Pall Mall Electric Light Co., Ltd.

The net profit for the year ended December 31st, 1925, was £67,907; to this is added £18,393 brought forward, making £86,300. The interim dividends absorbed £13,500, and it is proposed to deal with the balance (£72,800) as follows:—To employés' superannuation reserve, £25,000; final dividend on the 7 per cent. preference shares, £3,500; and a final dividend of 7s. 6d. per share and a bonus of 5s. per share on the ordinary shares, making a total distribution of 17½ per cent. for the year; leaving £19,300 to be carried forward. The report states that the connections increased from 24,073 kW to 26,631 kW and the amount of energy sold from 21,143,734 kWh to 23,650,969 kWh. Reference is made to the passing of the London Electricity (No. 2) Act which extends the tenure of the company and other companies until 1971 and regulates the dividends to be paid in future. The directors are taking the necessary steps to carry out the arrangements embodied in the Act. The extension of tenure enables the board to recommend the establishment of a superannuation fund for the employés. An extraordinary meeting for this purpose will follow the ordinary meeting which is to be held on March 2nd.

Central Electric Supply Co., Ltd.

After providing for sinking fund and depreciation the net balance for the past year is £5,001; £9 from the last account is added, making £5,010. A dividend of 5 per cent. upon the ordinary shares is recommended and a balance of £10 is carried forward. During the year the company supplied a total of 78,429,805 kWh to the following undertakings:—The Westminster Electric Supply Corporation Ltd the St. James & Pall Mall Electric Light Co., Ltd., the Chelsea Electricity Supply Co., Ltd., the Kensington and Knightsbridge Electric Lighting Co., Ltd., the Notting Hill Electric Lighting Co., Ltd., the Metropolitan Electric Supply Co., Ltd., and the St. Marylebone Borough Council.

Westminster Electric Supply Corporation, Ltd.

The balance of net revenue account for the past year, after providing for general reserve, depreciation fund, and other charges, is £172,801. Interim dividends absorbed £50,156, leaving a balance of £122,645, which it is proposed to allocate as follows:—Final dividend on the 4½ per cent. preference shares, £12,375; final dividend of 2s. per share (making 3s. for the year) upon the ordinary shares, £75,562; leaving £34,708 to be carried forward. The report makes reference to the reorganisation of London's electricity supply, and states that, owing to continued ill-health, Capt. Bax has resigned from the board and the directors have elected Mr. P. J. Hannon, M.P., to the vacancy.

Allgemeine Elektrizitäts Gesellschaft.

The report for the year ended September 30th, 1925, states that the brisk activity which started with the year slackened in the course of subsequent months. The invoiced sales showed an increase of 50 per cent. over the previous year, while the orders on hand represent an advance of 30 per cent. The net profits amounted to 8,363,000 marks as compared with 7,223,000 marks in 1923-24. The works were fully occupied until the middle of the year; but then the scarcity of capital and the uncertainty concerning the collection of payments falling due caused the directors to exercise great caution in the acceptance of orders and in demanding considerable sums on account. In the machinery works the number of types was reduced, and a particularly light type of electric motor was placed on the market. The large machine works delivered for Norwegian account four generators which were the largest hitherto made there. The steam turbine department was hampered through labour troubles at the beginning of 1925, this causing delays in deliveries. Present orders exceed those on hand a year ago, other countries taking a notable part in the orders. The department has under construction three 70,000-kW sets for the Rummelsburg power station, and it is stated that the total orders in the turbine works represent 750,000 kW. After referring to other central station work the report mentions that the company undertook the construction of high-pressure long-distance lines for various undertakings. Concerning the question of traction it is stated that business was brisk with regard to the covering of the requirements of the tramways in electrical equipment, but new orders for electric locomotives and motor cars declined. The future of the electrical industry is considered by the directors to be fairly promising. Whereas formerly 60 per cent. of the total turnover was disposed of in the home market and 40 per cent. abroad, the respective relationship is now 70 to 30. The reduction in the export percentage is attributed partly to protective tariffs abroad, unreasonable commercial policy, &c., although the hope is entertained that the pre-war percentage will be regained.

Swedish Company.—The *Allmanna Svenska Elektriska A.B.* (*A.S.E.A.*), after having made provision for depreciation, reports net profits of 3,010,000 kr. for 1925, as compared with 2,030,000 kr. in the previous year, and the rate of the dividend rises from 2½ per cent. in 1924 to 4 per cent. last year. The favourable result is attributed to the expansion in export trade; Sweden increased her electrical exports from 17,500,000 kr. in 1924 to 21,000,000 kr. last year, and the chief share was obtained by the A.S.E.A.

Mersey Railway Co.—The accounts for the year ended December 31st last show receipts of £225,897, expenditure amounting to £146,914, and a net income of £88,767, to which is added £2,731 brought forward, and an additional sum in respect of mail contract of £4,702, making £96,000. After meeting interest, rentals, depreciation and renewal charges, &c., there remains a balance of £21,797. Out of this the directors propose to pay the full dividend on the 3 per cent. perpetual preference stock, leaving £2,325 to be carried forward. The report makes mention of Mersey Tunnel Bill promoted by the Liverpool and Birkenhead Corporations, and states that as the result of opposition the company secured the introduction of important conditions for its protection. The annual meeting was to be held yesterday (Thursday).

National Gas Engine Co., Ltd.—A net profit of £39,147 was earned during the past year; to this is added £13,247 brought forward, making £52,394. After paying the preference dividend, one of 4 per cent. is to be paid on the ordinary shares, leaving £16,394 to be carried forward. Meeting: February 23rd.

Mather & Platt, Ltd.—Dividend on the ordinary shares of 10 per cent. per annum, together with a bonus of 5 per cent., both free of tax, less interim dividend of 5 per cent. already paid, leaving to be carried forward to next account £178,281.

Torquay Tramways Co., Ltd.—Dividend of 4 per cent. and bonus of 1 per cent., both free of tax, on the ordinary shares.

County of London Electric Supply Co., Ltd.—Final dividend of 10 per cent. less income tax, on the ordinary shares, making 15 per cent. for the year.

South London Electric Supply Corporation, Ltd.—Final dividend of 10 per cent., less income tax, on the ordinary shares, making 15 per cent. for the year.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Enfield Cable Works.—47,944 new ordinary shares of £1 each, issued at £2 5s. per share, partly paid and fully paid, Nos. 202,057 to 250,000.

Oliver Pell Control.—74,411 ordinary shares of £1 each, fully paid, Nos. 1 to 74,411, 25,000 8 per cent. cumulative participating preference shares of £1 each, fully paid, Nos. 1 to 25,000.

Shropshire, Worcestershire, and Staffordshire Electric Power Co.—50,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,160,001 to 1,210,000; 42,137 new "B" ordinary shares of £1 each, fully paid, Nos. 607,864 to 650,000.

Reading Electric Supply Co., Ltd.—£150,000 6 per cent. first mortgage debenture stock, issued at 102½ per partly and fully paid.

Siemens Bros. & Co., Ltd.—500,000 new ordinary shares of £1 each, issued at £1 3s. per share, of which 13s. is payable on application and allotment, Nos. 1,500,001 to 2,000,000.

Application has been made to the Committee to allow the following to be officially quoted :—

Auckland Electric Power Board.—Scrip, fully paid, for £250,000 5 per cent. water power conversion and general extension purposes debentures, 1925.

Johnson & Phillips.—100,000 ordinary shares of £1 each, fully paid, Nos. 500,001 to 600,000.

Electrical and Industrial Investment Co., Ltd.—After meeting debenture interest, taxation and other charges, the net profit for 1925 was £17,300 and the addition of £29,440 brought forward makes £46,740. The following dividends have been declared :—6 per cent. on the cumulative preference shares; 7 per cent. on the preferred ordinary shares; and 6d. per share on the deferred ordinary shares. £31,490 is being carried forward.

Rushden and District Electric Supply Co., Ltd.—The balance on the revenue account for the past year was £4,293 and sundry additions give an available balance of £6,121. From this £500 has been transferred to reserve and £1,990 to the depreciation fund. A final dividend of 4½ per cent. is recommended, making 8 per cent., as in 1924. The energy sold rose by 32 per cent. to 1,131,691 kWh. The meeting was to be held yesterday (Thursday).

Montreal Light, Heat and Power, Consolidated.—The gross earnings for 1925 were $18,348,806, as compared with $17,394,091 in 1924, and the net revenue rose from $7,670,190 to $7,890,026. The working capital rose to $10,647,089, and the total assets from $86,354,148 to $88,914,498. A dividend at the rate of 7 per cent. was paid for the first quarter; for the other three quarters the rate was 8 per cent.

Pennsylvania Water and Power Co.—The total revenue for 1925 was $2,960,436, as compared with $2,686,466 in the preceding year. The surplus increased from $1,264,837 to $1,343,320. A dividend of 8 per cent. has been paid (as in 1924), and $220,850 has been transferred to the depreciation reserve, $100,000 to sinking fund reserve, and $140,000 to contingent fund, leaving $22,774 to be carried forward.

North Metropolitan Electric Power Supply Co.—The directors recommend the payment of dividends due on the preference capital and a dividend on the ordinary shares at the rate of 10 per cent. per annum for the year 1925, the same rate as last year. £150,000 is to be placed to reserve, compared with £132,718 for the previous year, leaving £6,675 to be carried forward, compared with £7,297 brought in.

Mansfield and District Tramways, Ltd.—The balance available in respect of 1925 (including £1,374 brought forward) is £16,408. A dividend of 2 per cent. (making 5 per cent. for the year) is recommended on the ordinary shares, and £1,148 is to be carried forward. Meeting : February 22nd.

Isle of Thanet Electric Supply Co., Ltd. — At an extraordinary general meeting on February 12th a resolution was passed sanctioning the creation of 140,000 shares of £1 each (increasing the capital to £500,000) and the issue of 72,000 of these as preference shares.

Charing Cross Electricity Supply Co., Ltd.—The directors recommend a final dividend on the ordinary shares of the West End Undertakings of the company at the rate of 1s. 6d. per share, making 3s. per share for 1925.

Mexico Tramways Co.—A half-year's interest is to be paid on the general consolidated first mortgage 50-year 5 per cent. gold bonds on and after March 1st.

London and Suburban Traction Co., Ltd.—The directors state that they are again unable to recommend the payment of a dividend on the 5 per cent. cumulative preference shares.

Telegraph Construction and Maintenance Co., Ltd.—A final dividend of 7½ per cent., free of tax, has been declared, making 10 per cent. for the year as in 1924.

Stocks and Shares.

MONDAY EVENING.

THE Stock Exchange settlement which falls due to be dealt with in the present week, while one of the smallest that has been handled for well over a year, is also likely to prove to be one of the most difficult. There was a good deal of undesirable gambling towards the end of 1925, and one result of the rubber share boom was the upbuilding of speculative accounts, both in rubber and in other shares. These take a good deal of money to finance now that the tide has definitely turned downwards, and prices in many markets are heavy. Investment stocks and shares are affected by the unfavourable elements in the speculative divisions, through the necessity which holders discover of selling good stock in order to meet their engagements. Moreover, just now, people are realising Stock Exchange securities in order to meet income tax demands.

There is, on the other hand, a good deal of absorbing power on the part of money, and new issues that come to market are taken without difficulty where they present reasonable attraction to the speculator or the speculative investor. Compared with three months ago, the volume of business being transacted in the Stock Exchange is barely a fifth to-day of what it was then.

Electricity supply companies are declaring their final dividends, and several important announcements have appeared during the past few days. In no case have these caused any change in prices. The Westminster pays 15 per cent. for last year, St. James' 17½, London 10, Charing Cross 15, North Metropolitan 10, Central Electric Supply 5, Smithfield 8 per cent. These are the same, in every case, as the rates paid for 1924. It is taken for granted that, in the light of these dividend announcements, all the companies are likely to maintain their previously-paid rates, and that there will be nothing to enthuse over in the 1925 dividends. Considering, however, the excellence of the latter, shareholders are not likely to feel any particular disappointment at a repetition of the previous rates From the market point of view, however, prices are tame, the only change of the week that is worth mentioning at all being a rise of 1s. 9d. in County of London ordinary to 60s. Yorkshires at 30s. 6d. are 6d. lower. Clyde Valleys lost a similar sum at 30s. Fife Tramways weakened to 22s., a drop of a florin, on the announcement of the dividend making 6 per cent. for the year as against 8 per cent. in the previous year. The falling off is due, the directors explain, not to a decline in profits, but to the situation that has arisen in connection with coal.

The Underground Electric Railways have declared their dividends, and Districts get the expected 3½ per cent. for last year. The figures of the group, however, are not particularly good. Central London deferred receives 4 per cent., as before; London Electrics 3½ per cent., as against 4 per cent. The City and South London 3 per cent. for 1925 compares with 4 per cent. in 1924. Underground Income Bonds have their full 6 per cent. tax free, the same rate as is paid on London General Omnibus stock. The allocations to reserve are about the same as they were, except that of the London General Omnibus Company, which has gone up £50,000 to £300,000. The Central London and the District reduce their carry forward; the other four companies increase their balances. The Metropolitan Railway carried 105 million passengers last year, a decrease of 13 millions : the average fare of 2.693d. is a little over a farthing per passenger less than that taken in 1924. The net receipts came out at £674,000, a reduction of about £120,000, but the dividend of 5 per cent. is maintained, as we have already indicated. On the week, Metropolitans are 10s. lower, and the Underground Electrics are also a little easier, the £10 shares giving way to 2¼ on selling, some of which came from Continental sources.

Siemens at 30s are ex rights to-day, Monday, and the price of the new preferences is quoted at 5s. 3d. premium. Telegraph Constructions are 10s. up at 29, and British Aluminiums at 38s. 9d. are 1s. 3d. to the good. The rest of the group leans to the dull side, with small declines in Brush, 28s., Electric Construction 33s. 9d., Henleys 3⅝, Johnson & Phillips 27s. 6d. People are not taking the interest in this section that they were a few weeks ago, and in some directions shares have had to be sold on behalf of speculative purchasers who had to meet pressing liabilities incurred elsewhere. General Electrics can be sold at 31s. 6d., which is slightly better on balance.

The accounts of the Northampton Electric Light & Power Company show an expansion of £11,700, to £55,871, in the net revenue, and the directors propose to create 150,000 "B" shares of £1 each. This will raise the capital to half a million pounds sterling. The "B" shares last changed hands, some five weeks ago, at 32s. 6d. Victoria Falls ordinary shares are a good market at 49s., on the expectation that the company will benefit from a very comprehensive scheme of electrical development that has been arranged by the Union of South Africa. The Victoria Falls undertaking has four large power stations, and it is thought that these will be linked up with the Union Government's station at Witbank.

Wireless shares make an uninteresting display. There is hardly any active trade in them. Radio common are 9, the preference 9½. Canadian Marconi 4s. 6d., and the parent Marconis 25s.

London Traction issues maintain their recent improvements. Under the tightening hand of Traffic Control, it is assumed that the tramways will be afforded greater scope for profit-earning, if only from the fact that the L.C.C. and other important bodies have sunk too much money in trams for the systems to be treated with complete indifference. Consequently, according to this argument, something will have to be done to raise the business to a profit-producing plane once more. No dividend is to be paid in respect of last year upon London & Suburban Traction preference, which have had nothing since March, 1924. Foreign traction varieties are easier for choice. Mexican Light & Power preferred shares have gained 2 points better at 64½.

Cable stocks and shares exhibit a somewhat easier tendency. Globe ordinary fell back to 18¼. Automatic Telephones reacted to 51s. 3d., speculative interest in the shares having subsided for the time being. The rubber share market remains lumpish and is very disappointing to those who bought at the time when raw rubber soared to 4s. 8d. per lb. Its descent to 2s. 8d. per lb. has brought in a steady and continual stream of small selling, to counter which there is but little support, the result being, of course, that the daily disposition is for prices to sag.

Canadian Hydro-Electric Development.—*Reuter* states that the speech from the Throne at the opening of the Ontario Legislature referred to the development of hydro-electric power on the Ottawa River, which forms the natural boundary between Quebec and Ontario. The hope was expressed that an amicable arrangement would be made with Quebec, for an equal division of power. The speech also indicated that the Government would press for the development of power on the St. Lawrence River.

Electrical Association for Women.—A meeting is being held at the British Industries Fair, Birmingham, on February 23rd, at 2.30 p.m., with a view to inaugurating a Birmingham and District Branch of this Association. Mrs. G. Lawson will act as honorary secretary, and the branch has the support of Mr. Chattock, the city electrical engineer, and his department. At 3.30 p.m. on the same afternoon the party will be conducted around the Electrical Section of the British Industries Fair, and at 4.30 p.m. the Fair authorities will invite the party to tea, over which Lady Brooks (the late Lady Mayoress) will preside. Mr. G. S. Frances, of the B.E.A.M.A., will give a short talk on matters of electrical interest at the tea. The business meeting will be addressed by the London director, Miss C. Haslett. Those interested in the formation of the branch can obtain particulars from Mrs. Lawson at 19, Southam Road, Hall Green, Birmingham, or from the London Director, The Electrical Association for Women, 26, George Street, Hanover Square, London, W.1.

Electrical Progress in New Zealand.

Recent Power-Board Developments.

(From Our New Zealand Correspondent.)

AUTHORITY was recently given to the Auckland Electric Power Board to raise £650,000 for electrical-transmission purposes in its district. A scheme has been approved for the provision of electrical energy from the Arapuni project, and it is anticipated that the supply will be available in three years and will obviate the need for the present supply from the Hora Hora Rapids plant, recently taken over from the Waihi Goldmining Co., and that from the present steam plant at the King's Wharf. It was suggested at the time of the proposal of the scheme, about a year ago, that the requirements from Arapuni would be 15,000 kW, but this figure has been exceeded, and the demand is already over 18,000 kW.

£250,000 has just been raised for the installation of equipment at the various sub-stations. Part of the equipment will include three rotary converters, each of 2,000 kW capacity, to be erected at the King's-Wharf station, where the pressure will be reduced. 22,000-V switchgear will be required at this station, and five 22,000-volt cables will be laid underground between the Government sub-station at Penrose and the King's Wharf—a distance of seven miles. At the Penrose sub-station the existing 6,600-V switchgear, now being used in connection with the Hora Hora supply, will be replaced by apparatus of a heavier type, and a 6,600-kVA transformer bank will be installed to reduce the pressure. At the Beresford-Street station a second 2,000-kW rotary converter will be installed.

The work yet to be carried out in the Auckland Board's district, especially in the southern area, is held up temporarily on account of the non-arrival of supplies of material, due to the recent shipping strike. As soon as the shipments arrive, the Te Papapa, Mt. Albert and Point Chevalier sections of the scheme will be proceeded with, as well as the extensions of the city street-lighting scheme, which are to cost £30,000; and the additional city business and residential connections, estimated to cost another £22,000.

The change-over works outlined above will take about 15 months to complete, and other works under the extensions scheme will be completed as opportunity offers.

Although the work of installing an additional 20,000-kW of plant at the Lake-Coleridge undertaking is proceeding rapidly, the pace is apparently not fast enough for Christchurch's requirements. The normal load of the existing plant is 12,000 kW, and the peak load has reached the 14,000-kW mark. A few setbacks have been experienced. Recently a fall occurred in one of the tunnels and several men lost their lives; it was decided to divert the tunnel, and considerable time was thereby lost. Trouble was also experienced with the placing of the huge steel caisson in the lake bottom to the base of which the intake tunnel had been driven. The floating into position of the caisson and sinking it into the bed of the lake proved to be a work of rather delicate manipulation.

The extensions to the power house are almost completed, and the erection of the new pipe lines is being pushed ahead. New switchgear is in course of erection and additional gear is being assembled at the Addington sub-station. A second transmission line is being erected between Hororata, on the Lake-Christchurch line, and Timaru, and a further extension from Timaru to Oamaru is now under consideration. These lines will be used for the 11,000-V transmission contemplated in connection with the new works. The completion of the scheme will bring hydro-electric service within the reach of practically the whole of the Canterbury Province.

In the North Island the three main generating stations at Mangahao, Waikaremoana, and Arapuni, when completed, will be linked up as a major triangle, to provide in all some 240,000 kW when the full supply is available. From these stations 110,000-V lines convey the energy to the numerous sub-stations, whence it is distributed over 11,000-V lines to the local distributing agencies. Some 33 Power Boards act as middlemen in the supply of Government energy to the local consumers, each Board operating its own sub-station. Almost the same conditions apply in the South Island, the ultimate idea being to link up Lake Coleridge with other plants to be erected in a manner somewhat similar to that of the northern system.

It is interesting to note that the 11,000-V lines are built on double type hard-wood poles.

Work on the hydro-electric undertaking at Arapuni Rapids is proceeding, and is already ahead of the contract time in some portions. The construction of one of the main 110,000-V lines has been completed between Hamilton and Auckland, and over this a temporary supply of energy from the Hora Hora works is being transmitted. The 50,000-V line from Arapuni to Rotorua is now almost completed, and the extension of the Te Awamutu 50,000-V line to Hangatiki for the Waitomo Power Board is well under way.

The Arapuni scheme is the largest yet undertaken by the Government; it consists in diverting the waters of the Arapuni Gorge into its old river bed and thus utilising a fall of 165 ft. where the old bed returns to the present channel. The available flow is calculated as 5,300 cusecs, and the average load, with a 50 per cent. load factor, is 120,000 kW. The site of the power house is some 105 miles from the city of Auckland, where the greater portion of the energy generated will be consumed, but it is also in the heart of the Waikato country, where there are several growing towns and where the farming and dairying inhabitants will take a considerable quantity of energy. The Arapuni project is expected to be completed by the end of 1928.

The rapid growth of hydro-electricity in New Zealand can be gauged from the following facts. From a capital outlay of £9,566,589, a net profit of 1.31 per cent. was last year (financial) returnable to the 87 Power Boards operating on behalf of 930,980 people, or 70 per cent. of the entire population of the country. The number of consumers increased by over 20 per cent., and is now over 155,000. The working charges for the supply during the year were £780,826, capital charges £732,086, and the net profit for all the Boards £125,884. 34 Power Board districts have taken polls for the raising of loans, all of which were successful, and the total amount required is £9,372,074. The net profit, £125,884, is represented by a profit of £162,376 from 59 Boards, and a loss of £36,492 from 28 Boards. Most of the latter were in their first year's working.

The total length of power lines in the Dominion is now 6,200 miles, an increase of 215 per cent. since 1921, while of the 90,000 kW supplied, water and steam account for 94 per cent., gas 4 per cent., and oil 2 per cent. The increase in the supply available has risen by 24 per cent., and the farming community is increasingly utilising hydro-electric energy. A return shows that the number of milking machines in the Dominion has increased by over 5,000 during the year, bringing the total in use up to nearly 20,000. In one Power-Board district alone there are over 1,000 milking machines—a figure which approximates one machine to every three consumers in the district.

Electric cooking is also becoming increasingly popular; the increase in the number of cooking ranges installed last year was 1,526 in the Mangahao district alone, or three to every hundred persons. In some other districts the figure is as high as 5 per hundred. This figure would have been higher in all probability had it not been for the shortage of material on the market caused by the shipping hold-up.

Electrical Exports and Imports of Czecho-Slovakia.

Below is a statement of the quantities of electrical and allied material exported from and imported into Czecho-Slovakia in 1924, based on the recently-issued official statistics for that year. These statistics are now being issued on a new plan, and those for 1924 include goods exported or imported for improvement or repair, and also imported goods having undergone similar treatment. Figures for the previous year do not include such trade. They are, however, given below in order to afford a rough comparison, and notes or increases or decreases are added.

The Institution of Electrical Engineers.

Annual Dinner and Reunion.

The annual dinner of the Institution of Electrical Engineers was held at the Hotel Cecil, London, on February 11th, the President, Mr. R. A. Chattock, city electrical engineer, Birmingham, being in the chair. That it is one of the most popular yearly functions is evident from the fact that the attendance grows larger each year; the diners numbered 586, and a most enjoyable evening was spent.

The King and members of the Royal Family having been toasted, "The Institution of Electrical Engineers" was proposed by the Right Hon. Neville Chamberlain, Minister of Health, who pointed out the fact that the Institution membership was in excess of 12,000, and it was the largest Institution in the country. He knew of no other agent on behalf of which such extravagant claims had been made as electricity by a public whose enthusiasm was only equalled by its ignorance. It must be admitted, however, that electricity had no rival as a producer of light, and it had become the most popular form of power. The first sketch of the Government's scheme had been welcomed by the public with a unanimity which was positively alarming. The only thing which consoled him was that it was praised quite as much for what it did not do as for what it proposed to do. To begin with, there was to be no subsidy; that was quite a change, and no nationalisation—in fact, as little State interference as was compatible with the purposes they had in view. The Government's aim might be expressed under three heads—to provide for concentration of production, for the pooling of power reserves, and for the standardisation of equipment. If they could achieve those three objects, they might hope to see throughout the country, on the average, some considerable cheapening of electricity, and certainly a very much increased availability of supply. Purposes of that kind were worthy of a serious national effort, but, of course, changes of that kind could not be made without interfering with local and personal interests. There would be a certain amount of dislocation and change and the abolition of existing offices, but what they were after were changes in the national interest, and what benefited the community as a whole sooner or later must percolate to every individual part of it. In the carrying out of the proposals, after they had received Parliamentary sanction, the Government would look to that Institution for assistance, and he felt confident it would receive it.

Mr. R. A. Chattock, President I.E.E., in responding, remarked that they were often told that they were still in their infancy, but they should reflect that they were now over 50 years old and held a position in the scientific world second to none. It was satisfactory to note the interest which members took in their Institution, but a question sometimes heard was: "What has the Institution done for me"? His reply to that was: "You are the Institution"; he had no patience for men who expected others to do for them what they could very well do for themselves. The Institution was willing and anxious to do everything it could to assist the Government to further the interests which the Institution represented. What ultimate changes the electrical age which they were now inaugurating would bring, he would be a bold seer who could prophesy. He was confident, however, that they were on the fringe of enormous developments.

Mr. W. B. Woodhouse toasted "Our Guests," saying that the presence of the president of the Royal Society (Sir E. Rutherford) reminded them of the dependance which they placed on the work of other Societies and he hoped they, too, found the work of electrical engineers useful. After reference to many of the distinguished guests, including representatives of a French kindred body (Mr. M. Leblanc, vice-president of the Société Francaise des Electricians) and of the I.C.E., he specially welcomed the representatives of the great Dominions for which manufacturers had a special regard. It was pleasing to mark the growth of exports of electrical machinery; 1924 was a record year and in 1925 some 25 per cent. had been added to the previous year's figure, which placed this country in the place of the biggest exporter of electrical machinery in the world. Perhaps the most striking index of their progress was the ardent desire of all political parties to foster so rosy a youth. He hoped new legislation would not disturb healthy and natural growth.

Sir A. Steel-Maitland, Minister of Labour, in reply, said that the electrical industry at this moment, as he knew from the information which came to him every day, was one of the brightest spots in a picture which would otherwise be dark. He hoped it would continue to be bright and that the rest of the picture would become brighter to match it. There was hardly an institution which made itself felt more than the I.E.E., and that was because electrical engineers made up their minds about what they were going to say and then said it with one voice.

Sir Lynden Macassey, K.C., also responded to the toast.

A message of greeting from the Société Francaise des Electriciens was read by the president, and the British Imperial Orchestra played a selection of music during dinner and at the subsequent reunion in the Victoria Hall.

Illumination and Light.

The Faraday Lecture of the Institution of Electrical Engineers.

The Faraday lecture on the subject of "Illumination and Light" was given by Mr. A. P. Trotter, before the members of the North-Western Centre and others, at the Manchester College of Technology, on January 19th. Mr. A. G. Ellis, chairman of the centre, presided; in opening the proceedings he said it was about 100 years since Michael Faraday took up the position of Director of the Laboratory of the Royal Institution, and about five years later he made his great discovery of electromagnetic induction. In optics, also, Faraday covered an immense field; he was one of the earliest seekers after the connection between electricity and magnetism and light, so the subject of the lecture was a very appropriate one in commemoration of Michael Faraday.

Mr. Trotter said he had been asked to speak about something which had been a hobby of his for some 45 years.

During the last 15 years a branch of engineering had developed which had for its object the study of the application of light, natural or artificial, for the use and convenience of man.

The Illuminating Engineering Society had been formed in recent years for the study and development of this subject; if it had done nothing more than collect statistics of the amount of illumination necessary for different purposes—houses, factories, schools, public buildings—it would have done good work, but in fact it had accomplished much more. The subject of "glare" had also received attention from illuminating engineers. Examples of it were easily found. A motor-car with headlights, on a dark night in a country road, gave an absolutely blinding glare, but the very same lamps, in the same car, would be hardly perceptible in bright sunshine. It was purely a matter of contrast, not of intensity of light. Although far more light was present in the latter case, it was much less dazzling.

The amount of illumination required for different purposes had been studied; the minimum for good street lighting had been ascertained and illuminating engineers had long lists giving the amount of illumination which experience had shown to be necessary for domestic purposes, railway platforms, workshops, schools, &c. The Home Office had made most useful recommendations as to the amount of illumination required in workshops for various kinds of work, ranging from 3 foot-

candles for ordinary work to a much higher figure in special cases, and no compulsion had been necessary to enforce those recommendations. Factory managers were becoming aware that accidents were reduced and the quality and quantum of the output were improved where there was light. The improvement was not only in higher candle-power, but also in the judicious arrangement of lamps and reflectors for different classes of work.

Light was not supposed to have any relation to any other branch of physics until 1846, when it dawned upon Faraday that there was an irresistible suggestion of similarity between the lateral or side to side disturbances of magnetic lines of force and the movement of light.

There was strong reason to believe that light itself was some kind of electro-magnetic disturbance in the form of waves.

So far as was known, all these vibrations and disturbances—from X-rays to the longest waves used in wireless telegraphy—were of the same nature, consisting of electromagnetic vibrations in a medium called "ether." Ether remained a speculative hypothesis; all that was asked of it was that it should vibrate; it was assumed that it had inertia or mass and that it was elastic and had absolutely unbroken continuity. Einstein said he had no objection to ether, his system being independent of it, but some of his followers declared that the hypothesis of ether was useless, unwanted, and unnecessary. Sir Oliver Lodge had replied that ether could not be dismissed as a mere negation; that a negative dogma was as bad as a positive one, but he distinctly said that it was not matter.

It was agreed that matter was composed of minute atoms which were formed of small particles called electrons rotating like planets round a central nucleus. Electrons varied in number in different atoms, and each electron had an orbit which it could change on impulsion; it might fly outwards or towards the centre. It was supposed that in doing so it liberated a certain amount of radiant energy. There was a mysterious limitation of the amount of energy so set free; the amount liberated at a time could be calculated. About 10 per cent. of the hitherto unexplained features of the spectrum, interference, the refraction of light, and other physical facts, might be accounted for in this way. Others could not be so explained, but appeared, as hitherto, to be fully explained by the ordinary undulatory wave theory of light. The discordance must be settled. The fact was that matter might have to be redefined. Our ideas of energy and matter were in the melting pot, and we must wait till they had been tried by the fire of mathematical analysis. Meanwhile it could be taken that there was nothing seriously wrong with the ordinary undulatory wave theory of light, but the complete theory was still unknown to the most eminent philosophers and mathematicians. A constructive theory of the nature of waves had been long overdue. As Sir Oliver Lodge had said, the end was not yet, and we should see common sense coming out of it. A new Faraday was wanted.

The lecture, which was illustrated with experiments, has been delivered also at Liverpool, Dublin and Cardiff, to large audiences.

Totally-Enclosed Switches and Fuses.

Messrs. Switchgear & Cowans New Ironclad Interlocked Unit-Type Gear.

The service demanded from ironclad, unit-type, airbreak switchgear has become more strenuous and one of the advantages of the new design of Messrs. Switchgear & Cowans, Ltd., is the fact that the hinge principle has been discarded. The new switch has been developed similarly to an oil-immersed circuit breaker, and has the advantages of a positive quick-make and quick-break reciprocating motion with two simultaneous breaks per pole.

In addition to accessibility the gear, as will be seen from fig. 1, is of very sturdy build; the two covers of the cast-iron cases of connected switches and fuses are interlocked by means of heavy lugs so that the fuse case can only be opened at the same time as the switch case, the switch then being "off" and the fuses "dead." The switch case cannot be opened when the switch is "on," neither can the switch be closed when the cover is open. Again, the top and bottom flanges of all cases of the same capacity are identical, which allows of the switch case being erected either on the top or bottom of the fuse case; it is therefore easy for the incoming "live" connections from the bus-bars to be made to the switch terminals and the outgoing cables to be so connected to the fuse terminals that the fuses can always be renewed in safety. Between each pole of the switches and fuses are arc barriers, dividing the cases into separate compartments for each pole or phase. The barriers are specially shaped to enable them to be easily removed and replaced. The moving copper contacts are held by a malleable-iron clamp at their centres where a tube of Bakelite surrounds each bar. The bars are mounted on a steel carrier to which the operating mechanism imparts a reciprocating motion. Hinges are thus dispensed with, and the bars can be removed with little trouble, each contact being entirely independent of the others, while the straight backward and forward movement of the contacts removes all torsional strain from the insulation.

The fixed copper contacts are of the bent-over spring type mounted on gun-metal bases. The two sets of upper and lower contacts are clamped by their bases to steel bars which are fastened to the back of the case. Between the ends, the bars are covered with a tube of Bakelite. The Bakelite tubes on these two bars and on each of the moving contact bars, are the only insulation on the switch. Both the upper and lower ends of the moving contacts make connection with corresponding fixed contacts, thus providing two simultaneous brakes per pole, and the terminals are right at the back of the case where they are not liable to be inadvertently touched. The operating gear is a simple lever-and-cam mechanism with spiral springs providing the quick-make and quick-break action, and is duplicated, the two sets being mounted inside the case at each end, with the operating spindle and moving contact carrier bar extending between them, imparting a reciprocating motion to the contact carrier bar, so that the pressure is evenly distributed and the alignment of the contacts is always maintained. The handle is free, except for the short time the catch is moving the cam and spindle round to open or close

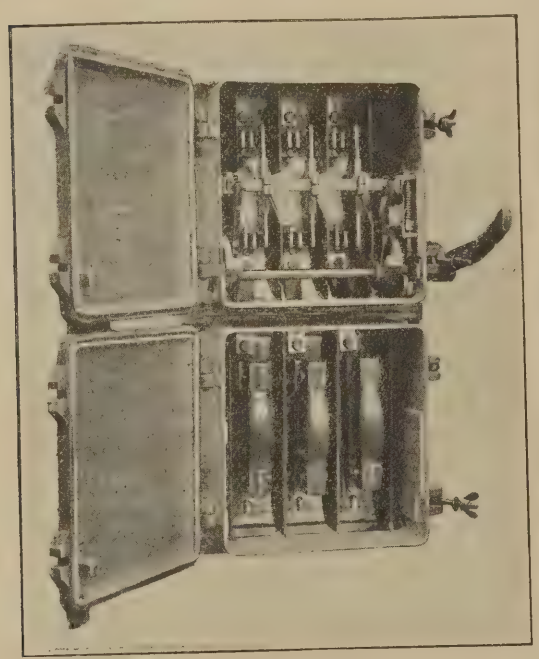

Fig. 1.—Ironclad Triple-pole Switches and Fuses.

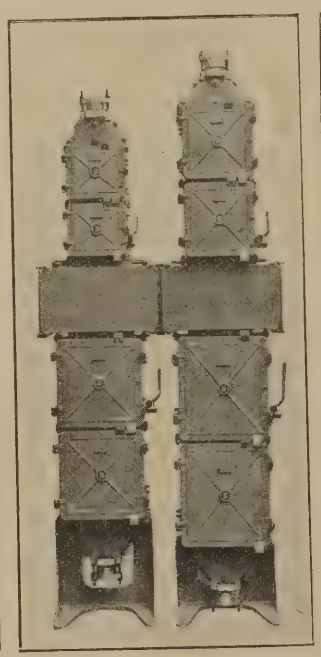

Fig. 2.—Unit-type Airbreak Switchgear.

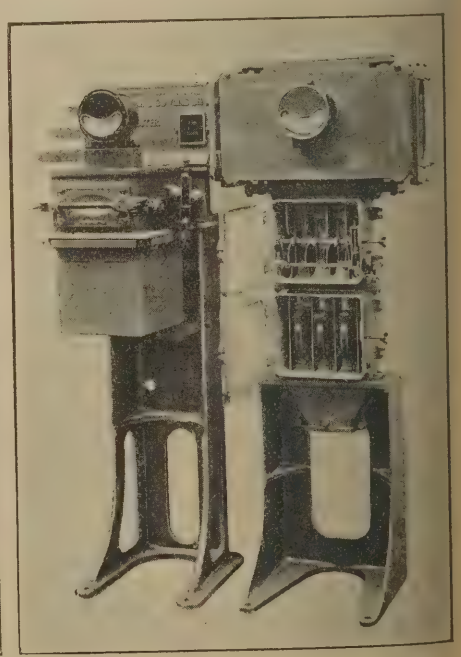

Fig. 3.—Combined Oil-immersed and Airbreak Pedestals.

the switch and the final opening and closing of the switch is done by springs; thus, a high speed is ensured independently of the speed at which the handle is moved by the operator. The switch is prevented from being operated when the cover is open by an interlock, nor can the moving contacts themselves be pushed in by hand. To comply with B.E.S.A. regulations, the interlock is arranged so that a competent and authorised examiner can operate the switch when the cover is open.

The S. & C. fuse carrier is said to be unbreakable; both the handle and fuse baffle are made of moulded insulating material, and, with the exception of the terminal screws, no small screws whatever are used in the construction of the carrier and contacts. The switchgear is made for either wall or floor mounting; cable boxes of any class, also pipe adaptors and instruments, are fitted when required. Various combinations of switches, fuses, and busbar chambers can be built up to form dust-tight ironclad switchboards of robust and pleasing design. When the current in any one circuit is in excess of 400 amps. an oil-immersed circuit breaker is used in place of the switches and fuses, as indicated in fig. 3. The switches and fuses are standardised in five sizes from 60 up to 400 amps., double and triple pole, for either a.c. or d.c. circuits up to 650 volts, and are successfully employed in many situations where conditions prevent the use of ordinary patterns.

Power Factor and Tariffs.

Types of Correction Plant, and a New Three-part Tariff.

(*Abstract of paper read before the* Institution of Electrical Engineers.)

At the February 4th meeting of the Institution, two papers on the above subject were presented. Mr. E. W. Dorey's contribution, which summarised the principal types of apparatus employed for the improvement of power factor, was abstracted last week, together with the subsequent discussion.* A résumé of the other paper was read by Mr. E. L. Hill, in the absence of the author in Australia; it contends that the wattless component of current, despite its having no energy content, involves the electricity supply undertaking in extra running costs, and that therefore a charge should be levied for supplying it as outlined below :—

A Three-part Tariff.

By E. V. Clark, B.Sc., A.M.I.E.E.—*Abstract.*

The great attention now being given to power factor suggests that the tariffs commonly used to-day are unsuitable in the present circumstances, which fact presents a paradox. In what other field of supply and demand are similar conditions possible? One cannot imagine a gas company imploring its satisfied consumers to adopt (for the benefit of the company and the supply generally) a type of engine which uses less gas. The point which lies at the root of the whole matter is the fact that an electricity supply undertaking is essentially a supplier of "electricity" and not merely of "power." A motor absorbs electricity and delivers mechanical power; the law of the conservation of energy tells us that a motor delivering so much brake-horse-power requires a certain minimum energy component in the electricity it consumes, in accordance with its inefficiency as a converter of energy; and in accordance with its inefficiency as a converter of electricity into energy, so it requires a wattless component in addition.

Extending the Hopkinson principle, one might suggest dividing to-day's cost of supplying electricity as follows :—

(*a*) The running costs involved in supplying the energy component of the electricity consumed.

(*b*) The running costs involved in supplying the wattless component of the electricity consumed.

(*c*) The standing charges incurred in being ready to supply the energy component of the maximum demand.

(*d*) The standing charges incurred in being ready to supply the wattless component of the maximum demand.

However, it seems quite impossible to frame a tariff which would differentiate adequately between standing charges on plant to supply energy and wattless component. To combine the two items (*c*) and (*d*) into one charge (based on kVA of peak load), though not strictly rational, is undoubtedly advisable. It would appear at first sight that a customer whose maximum demand is 1,000 kVA at 70 per cent. p.f. entails upon the supply undertaking somewhat less standing charges, *cæteris paribus*, than a customer whose maximum demand is 1,000 kVA at unity; but this is not necessarily the case, since diversity factor has a material influence and the diversity factor of the wattless component is, in general, much lower than that of the energy component. Combining (*c*) and (*d*) we arrive at a three-part tariff for the supply of a.c. power as follows :—

(i) A charge based on the kWh of energy used.

(ii) A charge based on the kVA-hours of wattless component used.

(iii) A charge based on the kVA of maximum demand.

With an appropriate tariff of this nature, the undertaking would gain by increased supply of electricity, no matter what the power factor. The use by consumers of the simplest and most reliable form of motor (the plain induction motor rated appreciably above its normal load) would no longer be a source of annoyance to the supply undertaking, but a direct gain; the onus of improving p.f. would be placed upon the consumer and the manufacturer's salesman. The suggestion that a low power factor should be a source of profit to a supply undertaking may appear revolutionary, but directly the wattless component is charged for at a price, however small, which covers its cost, its supply is no longer a disadvantage.†

An undertaking with an average p.f. of 95 per cent. supplies one kVA-hour of wattless component for every three units of energy supplied, and the economy in running costs secured by supplying at unity power factor would be barely perceptible. Yet where the average power factor is about 70 per cent., so that the kVA-hours of wattless component are equal to the kWh of energy, the total running cost of the wattless component is certainly much more than three times that in the former case.

The chief item in the actual running cost of wattless component is the increase in I^2R loss in generators, cables, and transformers. Upon a system of average p.f. (70 per cent.) whose layout is such that the units spent in these I^2R losses are 10 per cent. of the units generated, a saving of 5 per cent. of the units generated would be effected by abolishing all wattless current. Hence in a system such as this the running cost per kVA-hour of wattless component from this cause alone is about one-twentieth of the running cost per kWh. A second item is the extra generator excitation required to compensate, not only for the extra drop in the system, but also for the actual demagnetising effect of such wattless component. With a station of the above nature the order of this loss would be about 1 per cent. of the units generated. Another is the increased iron, friction, and windage losses in generators, &c., due to their being designed on a kVA basis; a direct increase in running costs may arise from wattless component being sufficient to require an extra turbo set to be operated (with reduced station efficiency) at times when the running turbine has not yet reached its limit of capacity, owing to the overloading of the alternator. Other disabilities lie in the greater complexity necessary to maintain a satisfactory pressure on the distribution system (since wattless component, as a rule, causes a larger drop than an equal current in phase) and in the increased difficulty it causes in effectively tying two distant stations; while the use of reactances to prevent disturbances in one part of a system from affecting other parts would be feasible to a much greater extent if wattless component were absent. In general, these disabilities have to be met by increased capital expenditure, and therefore increase standing charges rather than running costs. It is quite certain, however, that under heads such as these the supply undertakings incur running costs which could be avoided if wattless component were absent.

If, on a three-part tariff, standing charges are levied on the kVA of peak load irrespective of power factor, it is desirable that extra expense due essentially to wattless component should be regarded as running cost rather than as a standing charge, whenever any doubt occurs as to its allocation. The author suggests that for such a system as that cited above the total running cost per kVA-hour of wattless component is in the neighbourhood of 10 per cent. of the amount normally regarded as the running cost per kWh. In other words, an undertaking which at present operates on a two-part tariff of £z per annum of kVA peak load, plus 10y pence per kWh of energy supplied, might appropriately adopt a three-part tariff of £z per kVA of peak load, plus 9y pence per kWh of energy, plus y pence per kVA-hour of wattless component; or, more specifically, a two-part tariff of £5 per kVA demand, plus 0.5d. per kWh, might be replaced by a tariff of £5 per kVA demand, plus 0.45d. per kWh, plus 0.05d. per kVA-hour of

*Elec. Rev., Feb. 12th, 1926; pp. 270-272.

†Analogy : If it were the custom that sulphuric acid, whatever its degree of dilution, should be sold at a rate based solely on its acid content, on the ground that water is of too little value to be worth considering, then it would be to the advantage of sulphuric acid manufacturers to sell acid at that degree of concentration at which it was most cheaply made. It might pay them to keep a staff of men whose main duty was to urge customers to use strong acid, and to show them how strong acid might conveniently be used in their businesses. It would certainly pay manufacturers, while still charging on acid content, to allow a discount based on the degree of concentration of the acid required. But with the realisation that water, though practically valueless compared with acid, still costs something for distilling and for delivery, the manufacturer may frame a tariff based not merely on the acid content, but also on the water content of the dilute acid he is asked to supply. And with an appropriate tariff it will be more profitable to him to sell 100 tons of concentrated acid broken down to a specific gravity of 1.2 than 100 tons in the concentrated form.

wattless component; such a tariff might include any existing discount according to quantity, and sliding scale in accordance with price of coal, &c.

Assuming that this ratio of 9 : 1 is correct in the case of 70 per cent. p.f., the cost per kVA-hour of wattless component will be much less in the case of 95 per cent. and much greater in the case of 55 per cent.; this leads to an important difference between the assessment of the charge per kVA-hour on a three-part tariff and per kWh on a two-part tariff. In the latter case increased sales mean, in general, reduced costs of generation, and, consequently, it pays to assess the running costs per unit on a low basis in order to encourage the use of as great a number of units as possible. With wattless component, however, the opposite is the case; the tariff per kVA-hour of wattless component should be on the high side, tending to discourage, and an undertaking may with advantage assume an average power factor somewhat worse than that acutally existing. It should be profitable to allow for leading wattless component a bonus equal to the rate charged for lagging. Leading component taken by static condensers during the slack hours is on quite a different footing, and to levy no extra charge for out-of-phase current upon those customers whose p.f. is above 90 per cent. appears to be both illogical and impolitic.

Any form of charging for electricity which is confusing to the lay mind is intrinsically bad from the psychological standpoint, but the three-part tariff suffers from no undue trouble on this score, nor in most cases from difficulty in metering.

For measuring a single-phase supply on the three-part tariff one would require a maximum-demand kVA meter, an ordinary watt-hour meter, and a sine meter, *i.e.*, an ordinary watt-hour meter modified by introducing a time-lag of 90 deg. into the current or voltage. For three-phase work, similar meters of a three-phase type might be suggested, but in most cases a simpler form of metering may be used. The kVA-hours of wattless component will never exceed twice the kWh of energy consumed with any normal power user, and will rarely exceed it by 50 per cent.; whilst the rate charged will be of the order of one-tenth. It follows that an error of 5 per cent. in the measurement of kVA-hours is of less importance than an error of 1 per cent. in the measurement of kWh. Consequently, it will be quite sufficient to assume that the three-phase load is balanced, so far as the measurement of wattless component is concerned, and the sine meter need be nothing more than a simple single-phase watt-hour meter, the series coil being connected in one main and the pressure coil between the other two, the reading of such a meter on a balanced load giving $1/\sqrt{3}$ of the total kVA-hours of wattless lagging component taken, with a negative reading if the current is leading. The dial might read $\sqrt{3}$ times the actual consumption, so as to record the wattless kVA-hours of the three phases; or, alternatively, it might read "equivalent units," so that the wattless component recorded might be charged for at the same rate as the units of energy.

The sine meter, if it is allowed to reverse, gives full credit for leading current taken by condensers left in circuit all night; if provided with a pawl to prevent reversing, it fails to give credit for leading current taken at the time of load. However, there are ways of overcoming this defect, in the case of balanced loads, without introducing additional complications or requiring special meters, since two ordinary single-phase meters, their series coils being connected in two of the mains and their pressure coils thence to the third main, measure by the sum of their readings the total energy consumption, irrespective of any want of balance, while the difference between their readings gives the kVA-hours of wattless component, assuming balanced load, from the fact that the lagging wattless kVA-hours equal $\sqrt{3}(w_1 - w_2)$, or leading wattless kVA-hours equal $\sqrt{3}(w_2 - w_1)$, where w_1 and w_2 are the respective readings of the two meters. The use of two such meters involves little difficulty in computing the power bill from the meter readings, if the tariff is suitably quoted. Three methods may be devised, the following being probably the most satisfactory:—The tariff charges f_1 pence per unit for all units recorded, less a rebate of f_4 pence per unit for all units recorded on meter No. 2. (In this case $f_1 = x + \sqrt{3}y$, and $f_4 = 2\sqrt{3}y$.)

With two such meters, consumers get full benefit for leading power factor at the time of load, whilst a non-return pawl on No. 1 meter ensures that the consumer's rebate for leading current extends only down to a power factor of 0.5. However, if the units of energy do not constitute a rational basis for the electricity bill, it seems quite unnecessary to measure them, if one can provide a meter that will directly measure something else which gives a truer basis for computing the charge. By slight modification, a standard type of three-phase watt-hour meter is readily adapted to record, upon a balanced load, the kWh of energy consumed, plus or minus any desired fraction of the kVA-hours of lagging or leading wattless component consumed. That is to say, one may adopt a three-part tariff, using for those consumers whose load is reasonably balanced a maximum-demand kVA meter and an ordinary three-phase watt-hour meter, the latter being biased to read not in Board of Trade units, but in "virtual" units, to be charged for at a flat rate in accordance with the requirements of the proposed three-part tariff. The three-phase meter must comprise two single-phase armatures upon a common spindle, recording upon a common dial in the usual manner. The only modification necessary is to arrange that when one element is tested on single-phase current, the meter shall run a certain percentage fast, and that when the other element is similarly tested the meter shall run an equal percentage slow. If x per cent. fast and slow, we have a meter which, appropriately connected to a three-phase balanced load, measures accurately the kWh of energy consumed, plus $x/(100\sqrt{3})$ times the kVA-hours of lagging wattless component, minus $x/(100\sqrt{3})$ times the kVA-hours of leading wattless component. If the lagging wattless component costs (per kVA-hour) one-ninth as much as each kWh of energy, then $x = 19.2$ (that is, the two elevents of the meter are adjusted to run respectively 19.2 per cent. fast and slow) and by charging 0.45d. for all virtual units recorded, we are actually charging 0.45d. per unit of energy, plus 0.05d. per kVA-hour of lagging wattless component, less 0.05d. per kVA-hour of any leading wattless component.

The requisite bias may be given to a three-phase meter by designing the armatures or fields to have different strengths, by having different ballast resistances in their shunt circuits; or where current or pressure transformers are used, by having a different number of turns in the secondaries. Probably existing meters could be given the appropriate bias by so adjusting the brake as to make the meter run the required degree fast, and inserting an extra ballast resistance in the one shunt circuit. A non-return pawl is desirable to prevent the reversal of the meter under the effect of static condensers. The sanction of the Electricity Commissioners would be required before biased three-phase meters could be used, as they do not record the units of energy consumed, nor is it possible to deduce from their readings what has been the actual energy consumption, and therefore they do not comply with the requirements of the Electric Lighting Acts. Nevertheless, they measure the consumption of electricity on a balanced three-phase load on a perfectly definite basis, and their accuracy can readily be tested by testing each single-phase element separately. The determined charge for wattless component, however small, can be introduced with no expense save the initial one of altering the watt-hour meter installed. The consumer is not troubled by the addition of an extra meter that he does not understand, nor are his bills made up in any different form from that he is accustomed to, save that he is assessed in "virtual" units instead of in "Board of Trade" units. Any misgivings that he may have on that score will be largely alleviated by the fact that, while the number of virtual units recorded is not markedly greater than the Board of Trade units recorded hitherto, the price charged for them is 5 or 10 per cent. less. Indeed, for all power customers, large or small, except where the load is seriously out of balance, the biased meter should be quite satisfactory.

Electric Water Heating on Board Ship.—The internal-combustion engine-driven vessel *Belnor*, which has lately been completed by Sir W. G. Armstrong, Whitworth & Co. for Capt. Christen Smith, of Oslo, is of interest in that the water required for baths, &c., by the officers and crew is heated electrically by means of R-type storage geysers of the Bastian Meter Co., Ltd. (incorporating Bastian & Allen). The ship concerned is specially adapted for the transport of locomotives and has a dead-weight capacity of 4,100 tons. The type of geyser used consists of a tank to which the electric current is always switched on, thus giving 100 per cent. load factor, and at the same time a very small load. When hot water is drawn off, instead of the tank filling up immediately with cold water, it enters the tank at a rate proportional to the heating effect, and thus the remaining water is not lowered in temperature. It is only necessary to provide sufficient storage and a correctly-designed load to obtain a hot-water supply to meet all requirements that may be expected. In the case of the *Belnor*, two Bastian storage geysers are fitted. The one aft for the crew's use is of 100 gallons capacity, loaded at 2.8 kW, which, it is anticipated, will always be left on, and an extra heat of 1.2 kW for emergency. For the captain's requirements a 30-gallon geyser is provided with a continuous load of 450 watts. Thus for a continuous load of no more than 3.2 kW, the entire water heating for the crew and officers is provided. The geysers in question are rectangular, well lagged, and specially designed for ship work. To the best of our knowledge, this is the first sea-going ship which has a complete installation for water heating by electricity, and this has been followed up by an order for three other ships. Another point is the use of "Quartzalite" heating elements, designed to have a very long life, but when they do fail it is only a matter of a few minutes to replace them, and this can be done without in any way interfering with the installation.

Fuel Control in Italy.—In accordance with the replies to questions put by the Ministry of National Economy to the Commission appointed to deal with this matter last year, the Cabinet has approved of two bills of great importance. By the first, which provides for the control of fuel, the present associations of users of steam boilers are fused into a single body called the National Association for Fuel Control (Ente Nazionale per il Controllo della Combustione). The new association will exercise control over all apparatus and engines using fuel for any purpose with the view of enforcing the regulations suggested by the latest developments of technical science in order that the utilisation of fuel may be attended by as little waste as possible. New plant must fulfil all modern technical demands, and old apparatus and engines consuming large quantities of fuel and possessing a low degree of efficiency must be replaced within a reasonable length of time by modern apparatus and engines so as to realise the greatest economy possible. The second bill concerns measures for the better utilisation of home-produced fuels.—*Reuter's Trade Service* (Rome).

The Electrical Research Association.

Annual Meeting and Luncheon, and Report, 1920-1925.

The Luncheon.

ON Friday last the annual general meeting of the British Electrical and Allied Industries Research Association was held in private, at the Savoy Hotel, London. An abstract of the report of the Council for the year 1925 was printed in our last issue (p. 264). Mr. Ll. B. Atkinson, chairman of the Council, occupied the chair, and it was learnt that he had been elected president of the Association.

After the loyal toast, Mr. R. A. CHATTOCK proposed "The E.R.A.," congratulating the Association on its having passed the age of infancy and completed its fifth year. The work which it had done, he said, was very valuable and encouraging, covering all electrical interests and catering for the allied interests also. The inspectors appointed by the Research Department, who had reported so favourably, had pointed out that users derived great benefit from the Association's operations as well as manufacturers, and Mr. Chattock urged that they should share the expenses, seeing that they benefited financially from the work that was done. The Government offered further support if an extended programme was entered upon; the minimum requirements absorbed £16,000 a year, and additional funds should be provided.

So far the Association's work had been mainly electrical; as regarded the allied industries, a beginning had been made with condensers and turbines; and this work should be extended to include the corrosion of steam boilers; also the results obtained at power stations working on different systems should be collated and the most economical methods of operation deduced. The work done on poles for overhead lines would be useful in connection with the proposed national network; but the most valuable results were those obtained from the research on buried cables, by which large sums of money had been saved, which alone justified the support of the supply side of the industry. He wished all success to the Association, and paid a tribute to the ability of the director, Mr. E. B. Wedmore.

Mr. LL. B. ATKINSON, responding, recalled the formation of the Research Association, and said that agreements had been made under which the Association's supporters—mainly manufacturers—had guaranteed subscriptions, and the Department would assist them for the next five years, but on a reduced scale. At the end of that period the industry must provide for itself. Unfortunately, most people in this country were out of touch with science; little was taught in the schools, and the business world was recruited from the classes with a classical training. Business men had no individual knowledge of scientific method based on known facts and not on opinions; during the war science was called in, with astounding results, but afterwards the politicians fell back into their old ways. So the Government of this country, which was foremost in science, stood back from research and failed to realise what research could do for it. Did our countrymen realise that modern industrial and scientific knowledge was almost wholly the production of British effort? English agriculture was unrivalled throughout the world; in engineering our inventors led the world, and the locomotive, the railway, and the iron steamship were all British. The textile industries and the coal-gas industry were due to British inventors; in mathematics Napier, Newton, and Taylor, followed by Hamilton and Heaviside, laid the foundations, and navigation was made possible by Hadley's sextant and Harrison's chronometer. Optics, physiology and medicine, and surgery were revolutionised by Englishmen, and the secret of cancer recently yielded to British research. Chemistry owed the atomic theory, the production of sodium and potassium (and hence aluminium), benzole, and the aniline dyes to English researchers, and in electrical science, after the voltaic battery and the magnetic action of electric currents, almost every great discovery was British, up to the present day. Our fundamental discoveries had been developed by hundreds of brilliant workers in all lands, but the claim that every great step forward in modern science was a British product could not seriously be refuted.

It was unbelievable that any civilised State with such a record should have as its deliberate policy that it would not support research. The problem of employment in this country on the scale necessary to maintain the present population depended wholly on the finding of new products, new methods, new outlets. Within a few months the nation would have to find 20 millions to support the most backward industry in the country—a sum which, if applied to research, would almost certainly in a few years enable the production of coal to be abandoned for ever. Research associations and workers were not asking for charity—they were urging that the present squalid civilisation should be replaced, as it could be, by a far better one, if applied knowledge in every sphere was encouraged and developed. Instead of being a last charge upon the resources of the nation, research should be a first charge.

Mr. A. R. EVEREST proposed the health of the new president, expressing the indebtedness of the Association to him since, seven years ago, he was appointed to represent the I.E.E. on the Council of the Research Committee.

Mr. ATKINSON, responding, said that no presidential office that he had occupied had given him greater pleasure and pride.

Report on the Work of the E.R.A.

In addition to the annual report above-mentioned, a report covering the work of the Association over the whole of its existence was recently issued. The report points out that prior to the formation of the Association, large sums were spent by individual manufacturers and others on research, but there was no provision for co-operative research. After recounting the events which led to the birth of the present Association, the report shows that there are important classes of work which can only be carried out in this way, and that the "E.R.A." has filled a recognised gap in the organisation of the industry. The results already obtained point clearly to the great possibilities of large-scale fundamental research. The research on oil circuit breakers has been marked by the production of revolutionary ideas which point the way to increasing rupturing capacity by hundreds per cent. Experience is showing that fundamental research in science is needed for the resolution of known problems. The standardisation of measurements and practice has produced material improvements in connection with insulating materials, as well as with switchgear, mining apparatus, and overhead line equipment; new and important data have been obtained by tests on a large scale of cables and overhead line equipment, leading to extensive revisions of practice and economy of materials. Revolutionary changes have been effected in some industries.

The Council of the Association is thoroughly representative of the electrical profession and industry, and all available facilities of research are used to the full, with the co-operation of the resources of individual members, the N.P.L., universities, polytechnics, other research associations, paper and silk manufacturers, public institutions, &c.; only in one section (electric control apparatus) is the experimental work done through its own staff, though 150 experts are engaged on committees in framing programmes and supervising researches. There are 13 sectional committees and 41 executive sub-committees. The report proceeds to review the numerous researches which have been and are in progress, indicating the nature of the results obtained, which in many instances are of a striking character. For example, insulating paper made to a specification based on the research work has shown better "ageing" properties than any previous sample; as great progress in the quality of asbestos products has been made in the last two years as in the preceding 20 years; ample supplies of insulating oil can now be obtained with an electric strength much above the tentative standard set up two years ago; the work done on the heating of buried cables is saving the country £250,000 to £300,000 a year; current practice in the design of "A" poles has been shown to be radically wrong; new data of great importance in oil circuit breaker design are constantly coming to light, and the breaking power of existing types will undoubtedly be increased many fold.

The report concludes with a schedule of researches in hand, a list of reports issued, lists of members of committees, members of the Association, &c.

Electric Bell-ringing.—It is hoped that before long "Great George," the 9½-ton bell in the tower of the University of Bristol, will begin sounding the hours. It is interesting to learn that the mechanism which will actuate the bell was made in Bristol, Prof. David Robertson, head of the Electrical Engineering Department in the Engineering Faculty of the University, having designed the apparatus which is now being tested. It consists of an electric motor-driven striking machine to lift and drop the hammer; a time device to cause the former to function; a master pendulum to drive the time machine and electric clocks throughout the building; and the time signal apparatus to regulate the pendulum by means of time signals received from Greenwich over the Post Office lines. In the event of the failure of the public supply of electricity, the first stroke will be sounded only. The time machine and the master pendulum were made by Messrs. Brecknell, Munro and Rogers, Ltd., with some assistance from Messrs. G. Langford & Sons in connection with the fine work of the pendulum mechanism. The latter firm is also making the dial for the master clock, which will be in the same case as the time machine and pendulum, but as an independent mechanism driven electrically by one of Messrs. Gent's standard movements. The striking machine has been made by Messrs. Olver & Fry, and credit is due to all these firms for the way in which they have carried out tasks entirely outside their ordinary experience.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

Guy's Hospital Outfit.

Guy's Hospital has been added to the list of institutions that have been equipped with broadcast radio-receiving apparatus under the *Daily News* fund scheme. In this case arrangements have been made for 500 listening posts initially, the installation having been carried out by the Marconiphone Co., Ltd., and special provision has been made to simplify adjustments and general manipulation.

An indoor aerial is used, which is quite suitable for reception from London and Daventry, in conjunction with a long-range Marconiphone V2; the amplifying unit is of special design to suit the particular case and possesses a six-way output, making each distributing line independent of the others. Three stages of low-frequency coupling are used by means of transformers in conjunction with one Marconi D.E.5 and seven D.E.5A valves. Each of the latter serves about 100 points in parallel through a specially designed step-down "Ideal" trans-

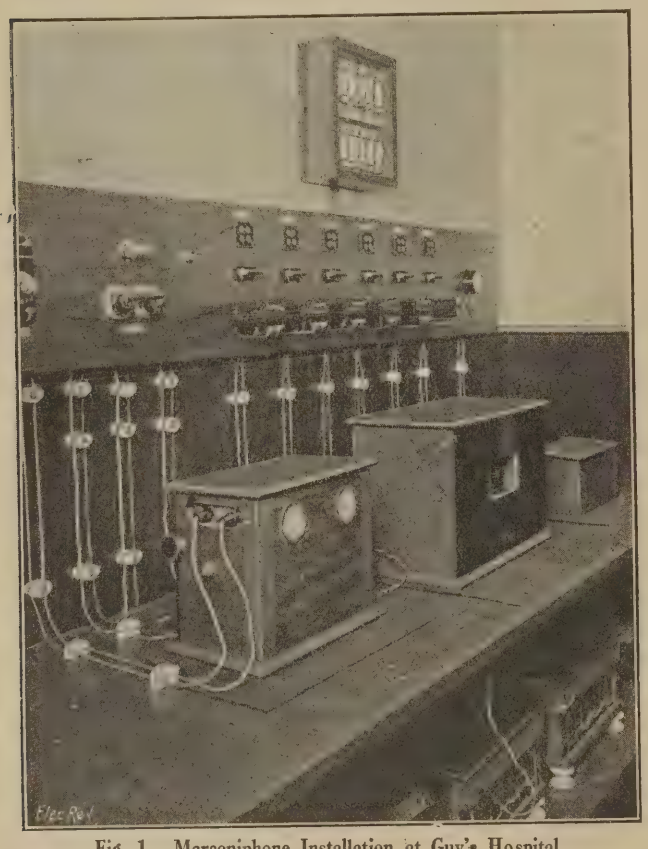

Fig. 1.—Marconiphone Installation at Guy's Hospital.

former with a ratio of 5 to 1 to maintain an even electrical balance; attached thereto are 'phone sockets for testing the output of each line at the amplifier end of the lines, also special damping resistances are arranged in order to balance the output of each line to suit the load, or number of 'phones in circuit. The wiring throughout the system is composed of lead-covered cable, a wise precautionary measure which reduces the possibility of faults developing on the distributing lines. A six-way double-point fuse box, situated between the line transformers and 'phone lines, somewhat facilitates the testing of the lines and also acts as a safety factor.

The high- and low-pressure supplies are obtained from a group of Exide accumulators, the former being composed of four 32-volt, 3-amp. batteries, and the latter of 6-volt, 105-amp. cells. A pilot lamp has been installed as a guide, which glows when the set is in operation, and special battery-charging facilities are being arranged for by the Marconiphone Co.

The "Radiostar" Receiver.

The recently introduced 4-valve receiving set bearing the above name has been designed by the EDISON SWAN ELECTRIC CO., LTD., to supplement rather than supplant its "Radiophone" model. It is capable of dealing with all wave-lengths with the aid of a number of range blocks in the form of single plug-in coils. The lowest coil will give a range of from 60 to 200 metres, and the highest up to about 2,600 metres. Tuning by means of a calibrated dial is unusual in this country; the aerial-tuning condenser control comprises a celluloid dial on which a hair line is engraved, and a second dial of metal on which the names of the principal stations are engraved. The celluloid dial is rotated over the engraved dial, the hair line being set to the station required. The metal dial has three concentric circles: on the inner one figure the low wave-length ranges; the middle circle bears the names of the B.B.C. and other stations between 250 and 550 metres, and the outer circle those of long-wave stations, such as Daventry and Radio Paris. The double condensers provide a simple method of tuning on the short waves; separate filament-rheostats are provided of the dual type, for either dull or bright emitter valves, and a Dewar switch brings in either 2, 3, or 4 valves, while the current supply to the valves is controlled by a "pull and push" switch, which enables one to switch on or off without interfering with the settings of the rheostats. The instrument is enclosed in a polished walnut cabinet with hinged doors. All connections are made to terminals on an ebonite strip at the back of the receiver, batteries being housed inside the cabinet and the valves are also inside. The plug-in inductance coils have 6 pins, similar to valve pins, which fit into a special socket, and for control there are 2 main dials only, while it is necessary to change only one coil to alter the wave band.

The "Seamark Connode."

A novel combination of two-coil holder and variable condenser is manufactured in London for MESSRS. C. E. NEEDHAM AND BROS., LTD. As fig. 2 indicates, a projection on the lower ebonite end plate serves as the fixed coil holder, the moving holder being attached to a spindle that is concentric with, and passes through, the hollow spindle of the movable condenser vanes; a separate knob having a short extension handle operates the coil holder. The condenser is of the usual square-law

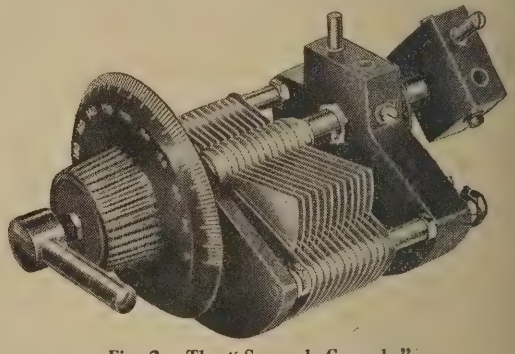

Fig. 2.—The "Seamark Connode."

pattern and a compact component of this type should be found very useful, as it facilitates the adjustment of reaction and capacity. The N.P.L., we understand, found the capacity between the movable plates and the fixed coil in its socket to be 3 micro-micro-farads, while in addition to its suitability for the broadcast and Daventry wave-lengths the device can be used for reception on waves down to 45 metres in length with a suitable circuit.

Some Igranic Components.

Realising the advantages that should accrue from co-operation between British and American manufacturers of high-grade radio components, the Igranic Electric Co., Ltd., has concluded arrangements whereby, in addition to its present range of components, it has become the exclusive manufacturing licensee of the products of the Pacent Electric Co. Consequently, some of the accessories which are

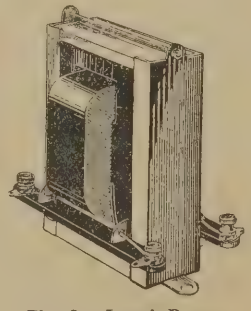

Fig. 3.—Igranic-Pacent "Superaudioformer."

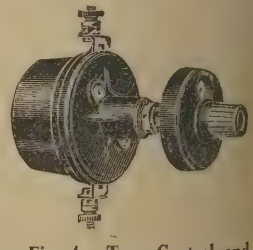

Fig. 4.—Tone Control and Damping Resistance.

offered are worthy of special notice; for instance, the "Superaudioformer," shown in fig. 3, is claimed to amplify uniformly all frequencies from 100 to 8,000, and so to be unique amongst l.f. transformers. It is suitable for use with general purpose valves, particularly for power amplification, and the insulation is made to withstand plate voltages up to 500 V. Soldering tags and slotted hexagonal nuts are provided.

A tone-controlling device and damping resistance is illustrated in fig. 4; its usual position is across the secondary winding of a l.f. transformer, but it may also be used to stabilise the h.f. portion of a receiver. In outward appearance it is exactly similar to the Igranic variable grid leak, 0-5 megohms, the resistance value in this case, however, being 0

to 1 megohm; it is suitable for use to cut down volume when receiving from a nearby station, obviating the necessity of mistuning the receiver, or dimming the amplifier filaments, so that the probability of interference and distortion which may be caused by resorting to these means is eliminated. For use as a damping resistance to increase stability in a valve receiver it may be connected in shunt with a tuned anode coil. It will be found reliable and constant in operation; the conducting parts are well separated from the control knob, thus eliminating hand-capacity effects, and single hole fixing is provided for.

The special feature of "Xllos" extra-low-loss coils (fig. 5) is the method by which adaptability in mounting is obtained. Precision wound, the coil is enclosed in a moulded Bakelite container, which excludes damp and dust. The contact pin

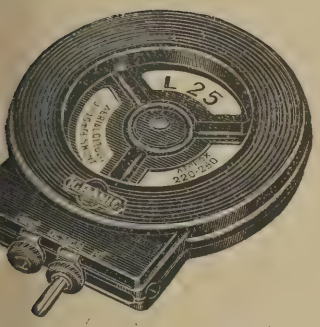

Fig. 5.—"Xllos" Low-loss Coil.

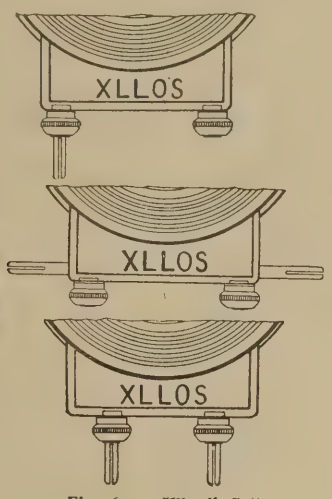

Fig. 6.—"Xllos" Coil; Methods of Mounting.

and socket, as indicated in fig. 6, are arranged to slide in slots formed in the moulded plug which is part of the Bakelite container. Thus the spacing between the plug and socket can be adjusted so that the coil may be used in standard holders, or they may be widely spaced for mounting the coil in a special low-capacity holder. The spacing is altered by loosening the milled ebonite nuts shown, and an extra pin is also supplied, which may be screwed into the socket to provide for double-pin mounting. It is thus evident that "Xllos" coils are valuable for experimental purposes; they are obtainable in six sizes.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The All-Electric House.

Electricity supply engineers should feel obliged to Mr. E. W. Dickinson and the Editors of the ELECTRICAL REVIEW for the article on "Fuel Economy and the All-Electric House."

I believe a coke-fired hot-water radiator system meets the constant requirements for warming that most recent milestone of progress, Electric House, Hackney. For comprehensive warming from a central boiler it is economical, effective, and hygienic—when properly installed.

But, quoting from the figures in the article, electricity with an effective 17 per cent. of the coal's c.v. beats gas with its ½ per cent. on all counts without further argument.

I acknowledge the utility of the coke and all other products from the distillation of coal, but this need not, and, in my opinion, should not, necessitate the distribution of gas in a network of pipes. It is the gas which accompanies the electric cables down the streets—though not, be it noted, into the rural areas where heat, light, and power is badly needed.

The increasing use of electrical energy is automatically reducing the selling price of electricity to its correct level. Meanwhile, the astutely advertised solicitude of the gas industry for national fuel economy forms an appropriate recessional.

Invictus.

Wrexham, *February 9th*, 1926.

The interesting facts contributed by Mr. E. W. Dickinson would have served a wider purpose to electrical readers if the commercial values had been given for gas and coke in relation to B.th.u. from the distillation of coal.

The 1 lb. of coal with an average calorific value of 14,500 B.th.u.; am I right in assuming that 75 per cent. of the B.th.u. is still retained in the coke and gas in the proportion of 50 per cent. and 25 per cent. respectively? Also, what is the relation of the value of the gas, plus the coke, to the value when the same coal is used at the rate of 1.8 lb. per kWh, taking electricity at 1d. per unit, coke at 30s. per ton, and gas at 9d. per therm?

If we knew the weight of the coke per ton of coal used, it would be helpful.

Can we rely on the figure 50 per cent. efficiency for gas heating for domestic use? It would be helpful to many to give relative facts, especially in view of the exaggerated claims made by enthusiasts on both sides.

B. Gill.

Leicester, *February 9th*, 1926.

In an article on "Fuel Economy and the All-Electric House" in your issue of February 5th, the author presses the need for fuel economy in the production of domestic power; but should this aspect take precedence of other considerations?

It would appear that the greatest efforts should be made to secure the maximum possible comfort, convenience, and efficiency for the present and immediately future generations.

The author of the above-mentioned article, in common with others, admits that electricity can afford a standard of comfort in the home higher than that attainable by other means. All that the public requires is the best, and it will have it, provided that it can be obtained at a competitive price.

Turning now to the question of fuel conservation (with especial reference to fuel supplied for domestic purposes), various estimates have been made regarding the period for which our coal supplies will last at our present rate of consumption of coal, electricity, and gas. Consider the approximate figure of 150 years, which is probably on the low side; we find that if all our present output (of coal) were to be entirely absorbed by modern power stations, so that electricity only were used for all purposes, the overall heat efficiency when considering the useful output at the consumers' end of the power chain would be about 17 per cent., a figure that, for the present purpose, may be considered as approximating to that actually obtaining under the present system of supplying coal, electricity, and gas. Therefore, if we were to completely electrify, in the manner suggested above, our coal supply would still last for the 150 years. Now taking Mr. Dickinson's overall efficiency ratio regarding "all-electric" and "all gas and coke," we see that if instead of converting it into electricity, we converted our coal into gas and coke, the country's coal would last for something approaching 300 years.

We see, then, that if we use electricity exclusively, we shall be able to enjoy its benefits for 150 years, after which something drastic will have to be done; whereas, if we use gas exclusively, we have nearly 300 years to go before the discovery or development of other sources of power becomes imperative. Now in 150 years many things may happen, and one can reasonably assume that a radical change in our present-day fundamentally inefficient method of generation will occur, or else a practical source of power other than coal will be discovered. One must remember that "necessity is the mother of invention," and it is hardly to be thought that future generations will lack creative ability.

The point of view that I would suggest is?—Should we consider rather distantly future generations at the expense of the present, where the benefit resulting from such consideration will very probably never be needed by such generations? If we are able, on account of various economic conditions and peculiarities, to generate the best form of energy, *electricity*, at a *selling price* which compares favourably with the costs of other forms of energy—well, why shouldn't me? Why should we attempt to stay the tide of progress?

L. F. Ryland.

Manchester, *February 8th*, 1926.

I quite enjoyed Mr. E. E. Sharp's letter in your issue of the 12th. If it misses the point and leaves me cold, yet I still feel I can write something. There is a vast difference between sane enthusiasm found on fact and the uncontrolled variety fed on fancy and generally ending in trouble.

If my contribution on "The All-Electric House" means anything, it means that the electrical industry should not be blind to the good selling points of the products of its competitors, but should rather wake up and become supreme by manufacturing a cheaper and better means for providing heat in the home.

Curiously enough, on page 352 of the last issue of the ELECTRICAL REVIEW, there appears an article which describes an experiment on four houses of the six-roomed cottage variety, built by the Woolwich Borough Council under its housing scheme. The results show that with electricity at 1d. per unit the average cost of providing light, power, and heat to the four houses was £27 18s. 5d. per house for 13 months, or £25 15s. 5d. per annum, subject to a 20 per cent. rebate. Does Mr. Sharp consider that, out of a wage of £4 to £5 a week, this is a reasonable sum?

If the Borough Council could be persuaded, for experimental purposes, to install four more houses with electricity for lighting and power, and with gas and coke for cooking and heating, I think the results would show a very substantial saving probably amounting to 30 per cent. in cash paid out, with almost equal comfort in the house, and conserving the nation's source of energy.

I have by your courtesy seen the letters of "Invictus" and Mr. B. Gill. "Invictus" is at fault in assuming that the thermal efficiency—c.v. of coal to the c.v. usefully applied in the home—of gas and electricity is 12½ per cent. and 17 per cent. respectively. A little consideration will show him that the gas is obtained from the destruction of one-third of the coal,

while the 17 per cent. is from the whole. The true comparison is 37½ per cent. and 17 per cent. Mr. B. Gill is correct in assuming that 75 per cent. of the B.th.u. contained in the original coal is retained in the gas and coke in approximately the division of 25 per cent. and 50 per cent. His other query may be answered by means of a small table given below :—

Heat in the Home.

Source.	Unit of measure.	Cost in pence.	Cal. value of unit.	Use factor in home.	Resultant cal. value.
Electricity at 1d. per kWh	1 B.O.T. unit.	1·00	3,412	100%	3,412
Coke at 30/- per ton	1 lb.	0·16	11,000	35%	3,850
Gas at 8d. per therm	1 Therm.	8·00	100,000	50%	50,000

That is to say :—

(a) Electricity gives... ... ... 3,412 B.th.u. for...1d.

(b) Coke ... ⅝ lb. = 2,406 } = 3,406 „ { ·10d. } = ·26d.
Gas ... 1/500 therm = 1,000 } { ·16d. }

On these assumptions electricity is much dearer than gas and coke for heating purposes.

Improvements in the generation, distribution and application of electricity will no doubt remove this disadvantage, but there is a vast field for improvement, and my only object is to disclose this field and make our industry absolutely impregnable.

E. W. Dickinson.

London, *February 13th*, 1926.

Sales and Prices.

The article on " Sales and Prices " in the Electrical Review for February 5th represents a considerable amount of labour, but it may be doubted whether any really useful purpose is served by a comparison on this basis.

If a sufficient number of cases were taken to make sure that each group of points for each small range of sales represented about equal proportions of the same kinds of sales, the mean curve would have some significance. Such a mean curve is faintly indicated by the graph for sales between 1 and 20 million units, but the scattering of prices on each sales ordinate indicates that the number of cases taken is insufficient for any general deductions. For the graph between 20 and 200 million units the number of cases is altogether too small for any " law " to be indicated. The reason is that these larger undertakings differ enormously among themselves in the character of their sales.

" Units Sold " are not the same articles in different cases. The average prices are a compound of :—

(*a*) Prices at the factory (as for bulk and traction supplies metered at the station switchboard);

(*b*) Wholesale prices for deliveries to the retailer (as for bulk supplies metered at the end of suppliers' transmission lines);

(*c*) Retail prices for delivery at the consumers' premises in very varying amounts.

(*a*), (*b*), (*c*) are in very various proportions in different cases.

The retailer has often to carry out finishing processes—transformation and conversion—before he can deliver the retailed article.

The retailer has to provide, maintain, and operate the distributing system.

Two examples of London companies will illustrate how meaningless average prices against sales may be. They are all taken from the 1923 figures in the Commissioners' Report.

The Central Company generated 51.102 m. units, and sold 47.188 m. It generated 108 units for every 100 units sold.

Its three customers—the retailers—bought and generated 62.166 m. units and sold 51.365 m. They bought and generated 121 units for every 100 units sold.

The St. James & Pall Mall Company bought 99.9 per cent. of its generated and bought total; 125 units for every 100 units sold; so that the Central Company generated 135 units and sold 125 units for every 100 units sold by this retailer.

The Central Company had expended capital on distribution to the amount of £77,167, or £1,630 per million units sold.

Its three customers had spent £1,529,155 on distribution, or £29,770 per million units sold. Their expenditure on meters alone—£95,606—is greater than the whole distribution expenditure of the Central Company.

The City of London Company generated 51.997 m. units (not far from the 51.102 m. of the Central Company) and sold 42.606 m., or it generated 122 units for every 100 units sold.

Its expenditure for distribution capital was £1,121,825 (£109,959 for meters alone), or £26,330 per million units sold.

It is unnecessary to carry on the comparison to working expenses on distribution and accounting, or to do more than mention load factor.

The figures given demonstrate that any comparison between individual undertakings on the basis of sales against prices is without meaning, unless their sales are of the same character.

Henry M. Sayers.

London, *February 8th*, 1926.

[The necessity of making full allowance for local conditions was indicated in the article and in our leaderette. There was no suggestion that any " law " could be deduced from the data plotted; the diagrams, indeed, suggest a total absence of conformity to any law. One of their striking features is the fact that throughout the output scale both small and large power stations are found supplying electricity at an average price between 1.5d. and 2.0d. per kWh; another is that quite small stations can supply energy for less than 1.5d.

The fact that bulk supplies cost the retailer more than he pays the seller, on account of subsequent transformation and conversion, tells against the bulk seller's average price, which ought to be proportionately increased in order to be comparable with the prices charged by undertakings which supply energy ready for use, to which class the small stations belong.

That the London companies are working under exceptional conditions—and making exceptional profits—must be admitted. A loss of 35 out of 135 kWh generated, between the source and the consumer—more than 25 per cent.—within an area of a few square miles is rather startling.—Eds. Elec. Rev.]

Portable Apparatus in Bath Rooms.

In your leading article headed " Unusual Dangers," of February 12th, you, in common with your contemporary, the *Electrical Times*, express the opinion that " portable apparatus should never be used in a bath room." It puzzles me to think how the use of electrical apparatus in bath rooms will be avoided. In the first place, it is the most natural thing to have an electric radiator in the bath room. It is just the place where gas and coal are unsuitable and electricity is the only reasonable agent, and as it is not required there for long periods, it is, even at the present prices of electricity, a reasonably economical means of obtaining the desired comfort in the bath room.

Apart, however, from the electric radiator, I cannot help wondering how it is possible to prevent other portable electrical apparatus from being taken into a bath room, for example, hair driers, hair curlers, shaving-water heaters, towel rails, &c. Even if it can be understood in the industry that no wall plugs shall be fitted in the bath room, there is still the lamp socket to which small portable apparatus will be fixed. Moreover, there are portable appliances used in the household with long flexible cables, such, for example, as the vacuum cleaner, which will be brought into the bath room from plug connections in the hall, on the landing, or in other rooms.

I am apprehensive of electrical Press statements against the use of portable apparatus in the bath room, but if it must be done, then it should be done thoroughly, and all lay users of electricity should be warned. The usual way in " safety first " propaganda adopted in works is to draw up a scare notice showing realistically the disastrous results of carelessness. If your attitude is correct, the public should be warned in this way. Personally, I doubt very much if it is the correct attitude to take. The plan adopted in a factory for dealing with the same " unusual dangers " is to use a 3-core cable which includes a separate strand for earthing, and there must be visible terminals showing the earth wire connection.

Unfortunately, the risk of shock does not stop in the bath room. It applies in all parts of the house " where water or low-resistance earthing media are present." For example, a breakfast room is heated from a central heating system. It is a very likely occurrence for the electric toaster or electric kettle to be placed on the water radiator. In the scullery also, what is more natural than that the water tap should be held in one hand and the electric kettle in the other?—or even a cigar lighter may be hung up on a disused gas bracket. The rarity of fatal accidents proves the safety of electricity as compared with other domestic service agencies, but there must be innumerable occasions where the residents of a house obtain shocks which, to say the least, do not contribute to comfort in the home, and tend to scare persons off the use of electricity. Owing to the very large amount of exceedingly poor 2-wire flexible cables which are in use everywhere, it must be years before a satisfactory system can become universal. Why not let us try to get it started? A sound system of earthing the framework of all portable electrical apparatus is possible. Earthing terminals and wires can be substantially connected and locked in such a way that they will not work loose. Admittedly the practice is at present rare in domestic application, but is there any reason why it should not be propagated? The protected type of wall plug with a metal casing is now the common property of all manufacturers, it having been specified in all details essential for interchangeability and good earthing by a British Engineering Standards Association Panel, and I understand that the publication of the specification is not far distant. I feel that if our electrical Press would only advocate good workmanship, design, and good quality of material, that would be a better policy than to deprecate the use of electricity in one part of the house, which advice, if taken logically by the public, is likely to be detrimental to the general use of electricity in domestic service.

Is it too difficult a matter to attempt to educate the public into the observance of the principle of earthing all metal work which contains electrical elements? A start, of course, must be made with the average wiring contractor, who, I believe, to-day is very reluctant to attempt an " all-earthed " house wiring system.

I enclose a sketch in case I have not made my meaning clear as to the type of cable and earth contact. As with everything else, there is always some risk, however remote it may be, and this must be faced with an " all-earthed "

system. Good and visible terminal connections are merely a matter of good mechanics, in which men in this country do excel. The remaining risk is that the earth wire in the flex may be broken, and this, again, I believe, is mainly a matter for careful mechanical construction of the cable itself, and the gland and terminal fittings.

The principles involved are very much the same as those relating to the larger switchgear installations. At one time the "all-earthed" metal-clad systems were almost universally deprecated, but advance in the art and experience has proved their sterling merit, and now metal-cladding and earthing have become the recognised measures for safety. I can foresee that objections will be raised to the "all-earthed" electric house on the ground of increased cost. The same arguments were used against metal-clad switchgear. To-day it is known to effect economies in the cost of electrical installations, and so I believe the future will see a time, maybe 10, 20, or must it be 50 years hence, when our present methods of flimsy electrical connections in domestic service will be looked upon askance as relics of the courage and fortitude of the present age.

H. W. Clothier, Director,
For A. Reyrolle & Co., Ltd.

Hebburn-on-Tyne, *February 13th*, 1926.

[We appreciate our correspondent's leaning towards earthed metal casings, with which he has been so successful on the larger scale, and we heartily approve of it in the case of fixed apparatus. We expressly said that in our opinion *portable* apparatus should not be used in bath rooms, and we emphasise the word portable because in the very next line to his quotation Mr. Clothier departs from the question by writing of "the use of electrical apparatus" without that word. Fix the radiator and earth it permanently and our case is satisfied. The same applies to shaving-water heaters and towel rails. Hair driers and curlers are more likely to be used in the bedroom, and, at any rate, not whilst one is in the bath, which is the danger spot (in every fatal case that we remember, the victim was in or on the bath). For the rest, we can only exclude wall-plugs and hope for the best; gas-heated geysers are still used in bath rooms, though people are killed by them every year. We included the scullery and cellar in our remarks. Elsewhere only hand to hand shocks are conceivably possible; a firm grip of opposite poles is most unlikely to occur, and with dry hands the risk of fatal shock from casual contact is too remote to require attention. "The rarity of fatal accidents proves the safety of electricity"; we know of no fatality in a living room or bedroom, hence there is no need to take elaborate precautions in such places.—Eds. Elec. Rev.]

An Electric Vehicle Association.

There appears to be a good deal to be said both for and against the formation of another association of those interested in electric vehicles.

Mr. R. J. Mitchell warns us again of the danger of having too many societies, and suggests that Mr. J. C. Elvy should join one of the existing societies. So far as I am aware, there is none wholly devoted to electric vehicles, nor any at present where members interested in such would not be entirely lost. It might be possible to get the Councils of the Electrical, Automobile, or Transport Institutions, for instance, to accept an electric vehicle paper once a year, or once in two years, but this is insufficient to allow users and makers to ventilate their opinions and get down to details. Most of us are aware that the discussion on an Institution paper extends to perhaps an hour and is usually very disappointing owing to limitations of time.

No doubt any meetings of a new Electric Vehicle Society would be very small, although probably more enthusiastic, and difficulty might arise in carrying on at all, as I know from experience. The Electric Vehicle Committee cannot invite all interested in this subject to join it, and we therefore arrive at suggesting some compromise to start with.

Why should not the Electric Vehicle Committee arrange meetings, with suitable papers and discussions, after its business meetings to cover all interested?

There need be no elaborate organisation, printing of proceedings, &c., to start with and the cost to such associate members, as they might be designated, would be only a nominal sum.

When the movement has grown, form the Institute if desirable and substitute a technical committee for the present Electric Vehicle Committee.

C. G. Conradi, M.I.Mech.E.

Otley, *February 9th*, 1926.

Battery-charging Equipment.

I should be glad if any readers of your pages could help me in a difficulty, as I have been unable to find anything capable of suiting my requirements, except at some extraordinary price, whereas it should be capable of a fairly cheap solution.

I wish to charge accumulators used for experimental purposes as follows:—

4, 6, 8, 10 or 14 volts at any rate from 1 ampere or upwards if possible—if higher so much the better, as, say, 5 amperes.

Then I also wish to charge 30-volt units at from ½ to a total of 1 ampere, this, of course, depending upon the number of units put on to charge in parallel.

The job must require a minimum of attention, be clean, free from objectionable noise, and not have a high upkeep charge. I don't wish to be compelled to purchase transformers, as I prefer to use my own, as I can then alter the tappings to suit, and if alterations are required later they can be made. I don't want any fancy cases—it is for experimental work, and I can house it to suit myself.

I should much appreciate any help offered, and if the a.c. voltages required to suit my requirements were stated for the apparatus recommended, it would further help.

It appears that experimenters are not catered for in this respect.

E. J. Capper.

Sheffield, *February 11th*, 1926.

[Probably a good many readers would be glad to know where such apparatus could be obtained for experimental work, as distinguished from the high-class finished apparatus supplied to the public.—Eds. Elec. Rev.]

High-pressure Cables.

With reference to the letter on this subject, in your issue of the 5th inst., I do not know whether I can agree with Mr. Addenbrooke that the Pirelli cables are at the "commercial" stage, when, according to the *Electrical World* of June 20th, 1925, they cost £14,000 per mile of single cable!

Assuming this figure to be correct, one wonders whether the idea is to have enough margin in the price to enable the whole line to be duplicated, and the pressure lowered, should it be found unworkable to operate at the pressure proposed; or whether the new system is so terribly expensive that it could not be put in for less money.

The work could probably be done with 30,000-volt cables at the price quoted, were it not for limitations in the size and number of conduits available.

A. M. Taylor.

Birmingham, *February, 13th*, 1926.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Bristol Electricity Scheme.—On February 8th, Colonel Woodcock asked the Minister of Transport whether permission had been granted for the city of Bristol to proceed with a new power station at Portishead before the Bill sanctioning the undertaking had been before the House.

Colonel Ashley replied that he was informed by the Electricity Commissioners that no decision on the Corporation's application had yet been reached.

Severn Barrage Scheme.—On February 8th, Colonel W. Ashley informed Colonel Woodcock that no expenditure had been incurred to date by the Ministry of Transport in connection with the Severn barrage scheme, but the estimated total expenditure on the further stage of investigation now about to be carried out was £28,875. The expenditure was being spread over two years, and it was impossible to estimate the cost of any further investigations before those now proposed were completed.

Heavy Oil Engines. — On February 8th, Sir V. Warrender asked the Prime Minister whether his attention had been drawn to the British Standard Specifications which had been prepared by the British Engineering Standards Association, and in particular to that for heavy oil engines in connection with electrical plant or otherwise; and whether Government departments would be directed to use this specification for their inquiries.

Mr. A. M. Samuel, who replied, said he had no doubt that the Government Departments concerned would in appropriate cases, make use of the work of the Association.

The Government's Electricity Scheme.—On February 9th, Col. Ashley, in reply to Mr. Day, who asked if, in framing his electrical power proposals, he would consider what legislative provision would be necessary to ensure that power cheaply generated under the Government electricity scheme would be as cheaply distributed to consumers by supply undertakings enjoying local monopolies; and whether, with that object, the consumer would be directly represented on the central authority to be set up under that scheme, said that the question had not been overlooked.

The Wireless Dispute. — On February 6th, Mr. Betterton, Parliamentary Secretary to the Ministry of Labour, stated that officers of his department had been in constant communication with both parties, with a view to arranging a settlement of the wireless operators' dispute. The employés' Association had informed the Department that the proposals of the employers for the settlement of the dispute were unacceptable, and had submitted an alternative proposal which was being considered by the employers. Both parties included a reference to arbitration among their proposals, but differences existed between them, both as to the basis of arbitration and as to the terms upon which work was to be resumed. A com-

munication had been sent to the employers and it was hoped that it might be possible to arrange a joint meeting when their reply had been received.

On February 9th, Mr. Betterton said that since November 26th last, 1,258 British ships had sailed from United Kingdom ports without wireless operators.

Broadcasting.—On February 9th, in reply to questions, Lord Wolmer, the Assistant Postmaster-General, said that the total number of wireless receiving licences in force on January 31st, 1926, was approximately 1,841,000. Since the passage of the Wireless Telegraphy (Explanation) Act, last Session, there had been 28 prosecutions for installing or working wireless receiving apparatus without a licence. Twenty-seven of these prosecutions were successful and one case was dismissed. Summonses for installing or working wireless receiving apparatus without a licence had been issued against 46 persons. Seventeen of the cases had not yet been heard.

New Telephone Exchanges.—On February 9th, Lord Wolmer informed Mr. Hudson that the number of telephone exchanges opened in rural areas during the year ended January 31st, 1926, was 224. Communication with any exchange within a radius of five miles from a rural exchange was afforded at the minimum fee.

Safeguarding of Industries.—On February 9th, Sir P. Cunliffe-Lister, the President of the Board of Trade, said that the number of definite applications made under the Safeguarding of Industries procedure up to date was 34. Of these, 13 had been rejected, as not disclosing a *prima facie* case, without reference to a Committee of Inquiry. Nine Committees had been appointed to consider 11 applications; and reports had been received and published in respect of nine of these applications. One application had been withdrawn. The others were either still under consideration or in abeyance.

Gas and Electrical Undertakings.—On February 11th, Mr. B. Peto asked the Prime Minister whether he would consider the advisability of arranging for the allocation of an equitable share of profits of statutory companies or municipal undertakings for the generation and transmission of electrical energy, referred to in the Speech from the Throne, to persons employed by those new undertakings on the precedent operated for many years by the South Metropolitan Gas Company and other gas undertakings; and whether he would also consider including provision for employés to invest in the capital of the undertakings and for their representatives to have a share in the management.

Mr. Baldwin said he had watched with interest the operation of profit-sharing schemes where they had been introduced, notably in the case of gas companies. While welcoming an extension of the principle on satisfactory lines, he felt that the matter was primarily one for agreement between employers and employed.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from February 10th :—

Symetro. No. 464,266. Class 6. Electric motors and parts and grinding machinery.—F. L. Smidth & Co., Copenhagen, and Victoria House, Victoria Street, S.W.1.

Thor (lettering and design), No. 464,601, and Thorola (lettering and design), No. 465,602. Class 8. Instruments and apparatus for use in radio-telephony.—The Reichmann Co., Chicago. (British representatives: Haseltine, Lake and Co., 28, Southampton Buildings, Chancery Lane, W.C.2.)

Triggerdyne. No. 465,983. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Princes Electrical Clocks, Ltd., 173, New Bond Street, W.1.

Triumph. No. 465,615. Class 16. Electrical fuse fittings of porcelain or earthenware.—Castle Fuse and Engineering Co., Ltd., 72, Haigh Street, Liverpool.

Redot. No. 456,519. Class 18. Electric fires.—J. & W. B. Smith, Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

London Traffic Control.—The report of the London and Home Counties Traffic Advisory Committee, which has been submitted to the Minister of Transport, contains proposals designed to control the competition of omnibus companies with the tramway undertakings. It is understood that the Committee does not urge the actual restriction of the number of 'buses using the various routes, but that the number of journeys in each direction be limited. The number of journeys will be increased during the rush hours (7 to 10 a.m. and 4 to 7 p.m.). The first Order will probably apply to services running between Uxbridge and Shepherd's Bush, and will take effect at Easter. Later Orders will affect the routes between Aldgate and Ilford, Euston and Enfield, Victoria Embankment and Wimbledon, and Barnet and Acton. The statutory obligations imposed on the tramways appear to have influenced the Committee in its decision, it being of opinion that the profit obtained by the tramways in the year ended March 31st, 1922, was reduced to a loss of £153,557 three years later owing to omnibus competition. The Committee urges that some immediate check must be applied if essential tramway services are not to become bankrupt, with serious results to the travelling public.

The

Electrical Review

VOL. XCVIII. FEBRUARY 26, 1926. No. 2,518

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

The Fair and the Future.

SEVERAL months ago at a London meeting of representative electrical authorities—but not for some reason or other open to the Press—the question of future policy of the industry with reference to exhibitions was under discussion, and as we were able to report at the time, a committee embracing all the various interests concerned was appointed to deliberate and report.

We are unaware whether the committee has yet met. Possibly the urgency of the subject was not considered to be such as to render expeditious action necessary. Certainly it is sometimes the case that policies form themselves under the influence of events more definitely than under the influence of discussion; and it may well be that what has been happening during the past few weeks at the British Industries Fair in Birmingham and in London has carried weight with some representatives and will not be without decisive effect when discussions eventually take place.

We believe that there is a general consensus of opinion amongst those whose judgment matters most that large electrical exhibitions such as took place at Wembley, Olympia, and Manchester, are only necessary at long intervals. We refer to exhibitions involving the erection of large plant, and lasting for prolonged periods. Conjoint action among manufacturers can ensure that any attempts by private parties to exploit the industry by promoting such shows shall be controlled. At the same time option must always rest with individual manufacturers regarding taking part in exhibitions of specialised industries in connection with which their own particular products have special application.

Another class of display—and one which must not be bound about with any jointly imposed restrictions—is that designed to popularise the applications of electricity in everyday life—domestic and small power work particularly. The Ideal Home Exhibition, which opens

on March 2nd, probably comes within this class, though the main electrical interest here, as last year, will be the combined domestic exhibit organised by the British Electrical Development Association and so popular with many thousands of the public. Local electrical exhibitions stand in a category by themselves as being desirable anywhere and at almost any time, though it is possible that these, if held with too great frequency, might involve a unity of policy on the part of some manufacturers. Electricity supply authorities which run permanent showrooms on enterprising lines as a definite part of their operations, have no need of special exhibition efforts apart from showroom activities; but even these showrooms must not be allowed to become too quiescent or somnolent—they must be so run as to maintain or stimulate the public interest; their existence must not be allowed to be forgotten. Co-operation between the electricity supply department, manufacturers, and local contractors should ensure success at such shows. Contractors may supplement these efforts by making their own shop windows more effectively impressive and demonstrative instead of letting them contain a general jumble of everything electrical and dropping the blinds or putting up the shutters at 7 o'clock at night when brightness would attract.

Then there are exhibitions such as we have at convention times—possibly these might be on a more ambitious scale. And some hold that if there is to be a big annual convention in future years with all departments of the electrical profession, industry, and trade taking part, the simultaneous holding of exhibitions, as in America, would be justifiable.

But whatever views may be in process of formation respecting any of the foregoing, there is no doubt that the future of the electrical industry in relation to the British Industries Fair is exercising many minds as the outcome of the successful operations which come to a close at Castle Bromwich, Birmingham, to-day. Various questions are being discussed. It is thought that the industry is now in a position to decide definitely in favour of co-operation at the Birmingham Fair for at any rate a specified number of years; that the response of manufacturers this year in so short a space of time may be regarded as a proof that many more firms will be prepared to take part, each in a small market shop form, next year; that this year's show can be made use of to increase the number of electrical overseas buyers next year because they will have heard of the excellence of this year's collection; that the wireless and other exhibits of a more or less electrical character that appeared in London this year should be transferred to Birmingham in future; in short, that Birmingham, with its vast hardware and metal trade collection, should be the place where every spring, colonial and foreign and home buyers could meet for a few weeks, perhaps a little longer than this year, with the certainty of finding a great market display of electrical manufactures, including apparatus, switchgear, cable, accessories, material, and so forth, and with the reasonable anticipation of meeting those who are competent to discuss their requirements with them.

We hardly think that there is any reason to doubt the majority feeling in regard to this matter, for as we have said already, it is to us unthinkable that the ever-growing electrical trade can be content with anything short of a magnificent business-getting demonstration among the other great trades of Great Britain. It would do us all good to have a regular trade fixture to look forward to and to put zest into. It need not be a costly matter for anybody.

Perhaps we shall have the satisfaction ere long of hearing whether the committee already mentioned holds views such as we have expressed, but from what we can learn from different quarters it is necessary that the announcement of a definite policy on this one point at least should be reached without any delay. We hope that that will be done.

Railway Electrification.

The interesting paper by Mr. H. Parodi, chief engineer of the Orleans Railway Company, which was read before a joint meeting of the Institution of Electrical Engineers and the British Section of the Société des Ingénieurs Civils of France on Thursday last week, comes at an opportune moment. We have on previous occasions drawn attention to the practical views on electrical engineering which characterise our French *confrères*, and the extraordinarily rapid development of electricity supply in the rural areas which they have brought about within the few years which have elapsed since the end of the war. That development is still in steady progress, and Mr. Parodi's paper is intended to show how the important scheme of electrification which is now being carried out by the Orleans Railway Company fits into the general electrification programme of France. The conditions differ from those obtaining in this country in that in France electricity is generated both by steam and by water power; but the conclusions arrived at by the engineers concerned are largely independent of this consideration, in so far as they arise out of the nature of the load.

As the author remarks, it is a question not merely of substituting electric for steam traction on a line having a dense traffic, but also of providing a large distribution system, of which the power plants and transmission lines can be utilised for a supply of electric power in all the districts through which the railway passes. In France the electrification of the railways is considered as a part of a more comprehensive scheme—not as itself the sole end to be attained, as in most other countries.

The author points out that the general direction of the main transmission lines should practically coincide with that of the railway lines on which there is heavy traffic. As the urban industrial load is far greater than the traction load, this procedure relieves the railways of the excessive burden of capital charges that would result if the transmission lines were erected solely for traction. On the other hand, the long-hour load of the railways enables the shorter-hour industrial load to be handled more economically than would be possible if the latter were alone to be dealt with.

It is interesting to learn that the French Government is considering a programme of gradual equipment and of progressive linking-up of the various distribution systems, rather than Government control of electricity generation. This mode of attaining the desirable end of interconnection—which eventually would take place through the bus-bars of the sub-stations—was commended by Mr. Roger T. Smith in his comments on the paper, in preference to the installation of a grid of high-pressure interconnecting lines, which, he said, offered little prospect of a cheap supply of electricity. Incidentally, it is identical with the procedure which we have advocated in these columns on more than one occasion, as the natural and most economical course to follow in the evolution of a national network.

The paper was read also before the Institution at Birmingham, when Dr. C. C. Garrard and Mr. F. J. Moffett, in the discussion, emphasised the importance of including the electrification of railways in the national scheme, in order to improve the load factor. The same view was expressed by Mr. R. A. Chattock and Mr. R. B. Mitchell at the British Industries Fair on February 17th.

In view of the excellent work that the French electrical engineers have accomplished, to which our columns have borne witness, it would appear that British power supply and railway engineers would find it well worth their while to cross the Straits and see for themselves the materials employed in France; and as the whole question of electricity supply in this country is shortly coming before Parliament, it would be a good thing if members of that body also investigated in person not only the legislation which controls (and *hastens*) development there, but also the enlightened methods of administration that have been adopted and the excellent results that have thus been attained. By that means they would learn more in a week than by any other course in six months.

The Electric Propulsion of Ships.

We have recently had occasion to mention that the electric propulsion of ships is not regarded in this country as being such a practicable proposition as it is in the United States, although both on steamers and on motor-ships the necessary auxiliary machinery is to a rapidly increasing extent being electrically driven. It must, however, surprise many shipbuilders and marine engineers to learn that there are no fewer than 49 ships, nearly all of which are of American origin, ranging from the largest and fastest warships of 180,000 horse-power each down to harbour tugs, in which this system of propulsion has been successfully employed. The North-East Coast Institution of Engineers and Shipbuilders is, therefore, to be congratulated upon having persuaded Mr. Eskil Berg, of the General Electric Co., of America, to present to its members a paper setting forth the advantages which, it is claimed, are obtained by utilising electricity as the means of propelling a ship in preference to the more usual systems of propulsion employed on British-built vessels.

From the abstract of Mr. Berg's paper, which will be found elsewhere in this issue, it will be gathered that the electric drive has much to recommend it, both as regards initial cost and the subsequent operating and maintenance charges. The General Electric Co., of America, has been responsible for the electrical equipment of a large number of the vessels built in that country, and in a competitive tender for a 22,000-ton liner having machinery of 17,000 h.p., it was found that the price of the complete electrical propelling equipment was substantially the same as that of an ordinary geared-turbine installation; but on account of the simpler and less costly foundations, piping, oiling system, &c., it was cheaper than any other method of propulsion proposed. It is unnecessary to reiterate the other favourable aspects of electric propulsion as applied to a vessel of the liner class, as they are set forth in detail by Mr. Berg, but it may be noted that on other types of ship, such as the cargo carrier which forms the bulk of the merchant tonnage of the world, equally substantial advantages would accrue. This is demonstrated by the fact that electric propulsion has been applied to almost every type of ship afloat, including not only the various kinds of screw-driven ships, but even paddle-wheel and stern-wheel driven vessels. It is almost unthinkable that any American commercial concern would purchase electrically-propelled vessels unless it was convinced that it was getting value for its money, and certainly it would not be expected to book repeat orders as many of them have actually done.

The question will at once arise: why has not electric propulsion been tried to a greater extent in this country? We have it on the authority of a high official at the British Admiralty that electric propulsion was seriously considered for the propulsion of some of our recent warships, but that for certain reasons—not due to inherent defects in the electrical system itself—it was deemed inadvisable to adopt it. In the case of merchant ships, the true reason is, we think, indicated—albeit accidentally—by Mr. Berg when he mentions that the equipment required on board ship, both as regards the engines and the electric generators, is of the type so successfully developed by designers and builders of land plant. This means that the contract for the machinery of an electrically-propelled vessel laid down in a British shipyard would be best supplied by a firm of engineers building ordinary electric power-station machinery, or, alternatively, the shipbuilder would have to face the initial expenditure on the necessary patterns, new equipment, &c., which is inseparable from the production of an entirely new type of machine. The shipbuilding industry has during recent years been passing through a period of deep depression; indeed, it is still the most depressed of the different branches of our great iron and steel trades, and it is certain that few, if any, of our great shipbuilding firms would be prepared to undertake so great an expenditure without the prospect of its being justified by numerous repeat orders. Moreover, the contract for such ships as are being built are eagerly sought after, and the prospect of sub-letting the contract for the machinery to a firm of electrical engineers is met by quoting the lowest possible price for marine machinery of the more conventional form. We feel, however, that with the return of prosperity to the shipyards of these islands—prosperity which is long overdue and which, we hope, will soon materialise—the prospect of a contract for the propelling machinery of a ship being placed with a firm of electrical engineers would be far greater, and the electrically-propelled ship might then have a chance of proving its merits to the British shipowner.

The London Power Co.

The appearance, at the beginning of the week, of the prospectus of the London Power Company, shows that the West End group of the London Supply Companies are getting under way at last. The £3,000,000 capital they are starting with ought to give them an opportunity to release some of that pent-up energy for reform and reconstruction which, according to abundant evidence given at courts and hearings, has been dammed up for unnumbered years by restrictive legislation. Anyhow, they are free now to proceed with a comprehensive centralisation scheme. We see by the prospectus that the new company embodies a concentrated essence of the directive genius of the ten West End companies, one director from each company constituting the Board. As regards administration, this staff ought certainly to augur success. The engineers are Sir Alexander Kennedy and Mr. G. W. Partridge. Sir Alexander, *inter alia*, has two of the most successful, financially, of the London companies to his name (Westminster and St. James'); and Mr. Partridge brings, also *inter alia*, an obvious aptitude for obtaining contracts for power supply from recalcitrant bodies (as witness his railway supplies) and for successfully carrying them out afterwards. Turning to the general manager, Mr. W. A. Pearman, here also we have a record of success in his work on the financial and administrative side of the Westminster company. It was Mr. Pearman, it will be remembered, who so effectively dealt with the financial side of the West End Companies' scheme before the Commissioners at the London and Home Counties inquiry. Also he played no mean part, we understand, in modelling and finally knocking into shape that all-important sliding scale under which the West End companies will now operate. But he does not often come into the limelight.

We wait with great interest the effect of this unification of control upon the operation of such an important group of companies. The figures as to economies effected will be valuable, as this is the first really comprehensive scheme of the kind. Moreover, this practical example will encourage the others and perhaps dispel the timidity of those still standing on the brink of reform. The company, as we learn whilst going to Press, has lost its Bill, and this may hamper its progress; but there is plenty of scope remaining for its activities. Captained as it is, and cargoed with three millions, this barque ought certainly to sail to success, and we wish it heartily *bon voyage*.

Boiler-Room Practice.

Coal Flow, Air Flow, and Steam Flow.

By JOHN BRUCE.

(*Concluded from page* 285.)

Some time ago the writer made a series of observations on two large modern boiler units, and the relation between coal consumed and steam produced for the two periods is shown graphically in figs. 3 and 4, while the data expressing the conditions of operation are shown in Tables IV and V.

On the assumption that the performance of the unit is expressible by a linear equation, it is seen that the no-load losses are 300 lb. of coal per hour, *i.e.*, 300 lb. of coal per hour would be necessary to maintain the unit at working pressure, but not supplying steam for any commercial load.

TABLE IV.

Total coal consumed	lb.	18,144	26,432	19,484	25,088	20,608	18,144	15,904

Duration of test period ...	... Hours.	2 5	2·5	2·5	2·5	2·5	2·5	2·5	6·0

These are not in the nature of tests, in the true meaning of that word, but are the ordinary observations that were made for station log-sheet purposes while the units were in commercial operation.

The measurements involved were made by instrument equipment provided for ordinary operation, and were as follows:—

Coal: Metered by Avery weighing machines.

Water evaporated: Indicated by steam flow meters, and calculated from readings of such indications.

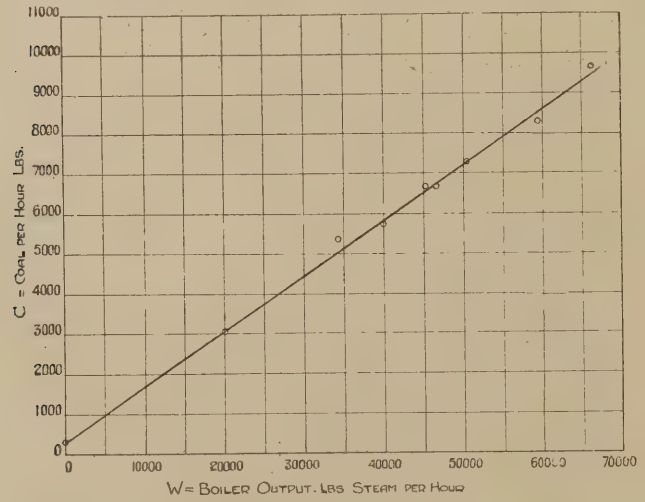

Fig. 3.

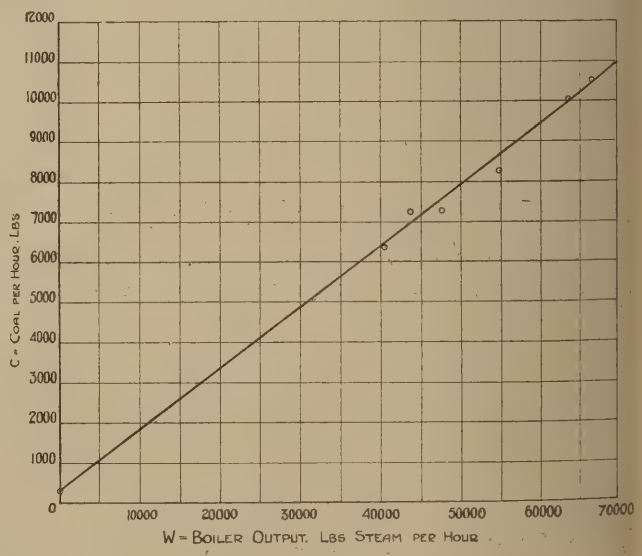

Fig. 4.

Relation between Coal Consumption and Boiler Output.

Temperatures: Measured by thermocouple and resistance pyrometers.

The only addition to the routine of ordinary operation was that the coal was regularly and more frequently sampled for analysis and calorimetric determinations.

From figs. 3 and 4 it will be agreed that the performance of these two boiler units can be reasonably represented by a linear equation, for even at a rating below that of half normal load, the linear relation between coal and water could be maintained (see fig. 3, boiler output 20,060 lb. steam per hour, coal consumption 3,024 lb. per hour).

A considerable number of tests were made to determine this no-load value experimentally, and the figure obtained varied between limits of 280 lb. and 320 lb. per hour. Further, the coals consumed varied over the range usually supplied to the boiler plant, and the effect of any variation is included in the results.

It will be seen from the ash contents of the coals reported in Table IV that there was a considerable variation in the quality of the fuel over the period shown, but the variation did not affect to any great extent the linear relation between coal and water.

From what has now been said, it will be agreed that (1) if the combustion of the fuel is complete; (2) if such combustion can be effected with a constant air/coal ratio, or in other words constant percentage of excess air; (3) if the resistance to the flow of gases through the boiler is constant; (4) if the internal and external heat transmitting surfaces are constantly free from heat retarding coatings; (5) if the combined equipment forming the boiler unit is maintained in a condition of

mechanical perfection; then at all times there exists, within reasonable limits, a definite relation between the factors discussed. These are rate of flow of air for

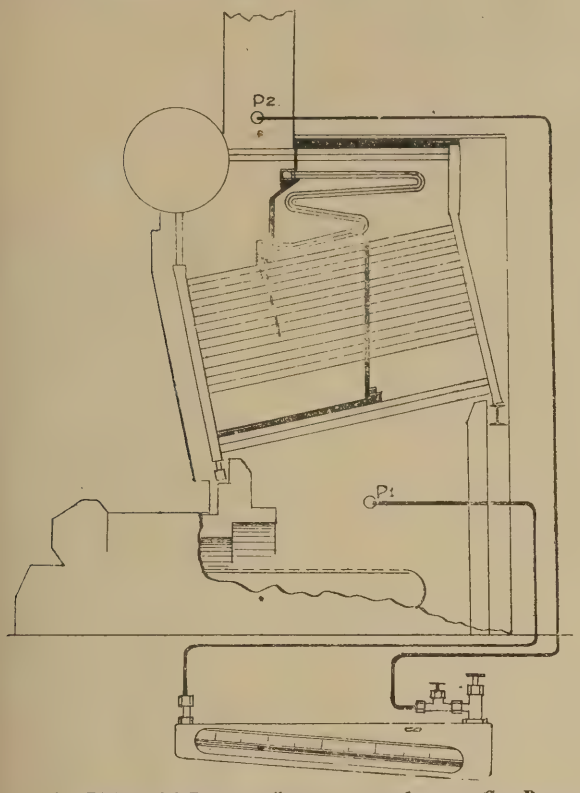

Fig. 5.—Differential Pressure Gauge connected across Gas Passes.

combustion, rate of flow of fuel, rate of flow of gaseous products of complete combustion, pressure drop of gases across gas paths of unit, and rate of flow of steam produced.

Considering the detailed assumptions on which this statement of facts is made,

(1) and (2) are under the control of the operating engineer, and can be attained by correct operation.

(3) Can be attained by the use of soot blowers for the purpose of maintaining the cleanliness of the heat transmitting surfaces in the path of the gaseous products of combustion.

(4) Can be attained by the use of soot blowers and attention to the treatment and production of the water fed to the boiler for the production of steam.

(5) Can be attained by continual attention to maintenance requirements.

It should now be obvious that if an instrument is provided to measure the rate of flow of steam produced and another instrument provided to measure the pressure drop of the gases between two fixed points, a comparison of the two indications considered together will express in certain easily interpreted terms the performance of the boiler unit, and if referred to a predetermined standard, they will further be a measure of the efficiency at any instant at which the boiler plant is being operated.

We will now consider the application of these theories and assumptions to actual operating practice, and for this purpose the case of definite examples will be given.

The writer made a series of tests on different boiler units, the purpose being to determine the relation between boiler output at different loads expressed in terms of steam flow, lb. per hour, and the pressure drop through the gas passes of the boiler.

The units on which the tests were made were of the Babcock & Wilcox C.T.M. type, with Green economisers, B. & W. chain-grate and Underfeed travelling grate stokers. The units were also equipped with Diamond soot blowers.

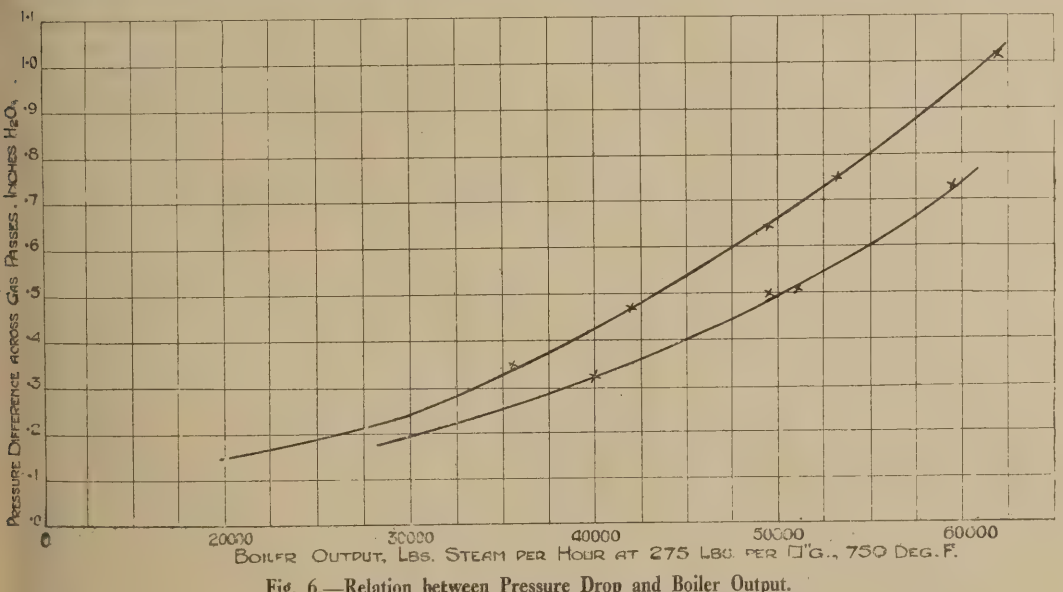

Fig. 6.—Relation between Pressure Drop and Boiler Output.

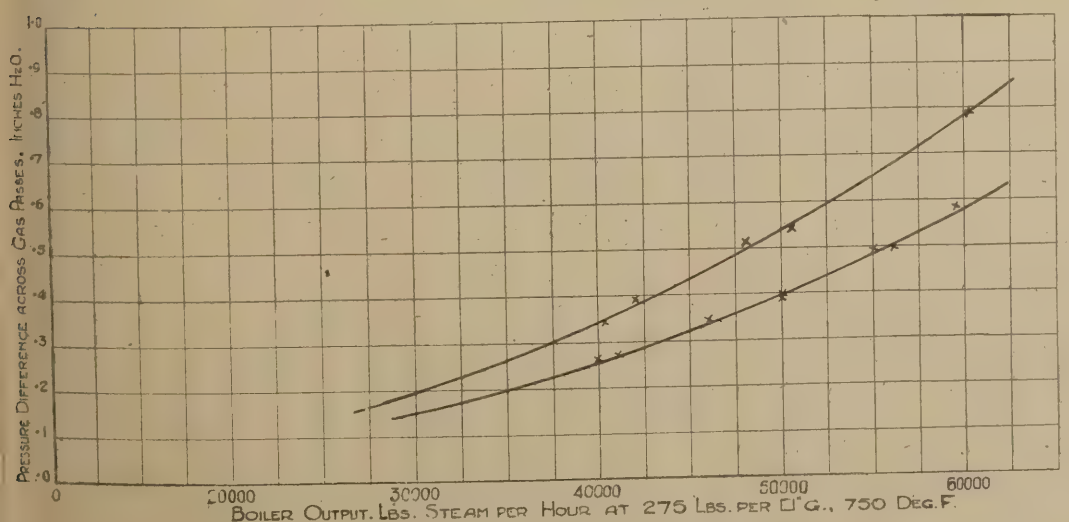

Fig. 7.—Relation between Pressure Drop and Boiler Output.

The instrument equipment of each unit consisted of steam flow meters, Avery automatic coal-weighing machines, a CO_2 indicator, thermocouple and resistance pyrometers, draught gauges, and a Hay inclined leg type differential pressure gauge. The last-named instrument was connected as shown in fig. 5. The foregoing represents the standard instrument equipment of the boilers tested, and in addition to that equipment, an Orsat set was used to check the air conditions and the automatic CO_2 indicator.

The tests were carried out as follows: Conditions were set to maintain a definite output at a constant rate of combustion. The feed temperature and the final condition of the steam being maintained as constant as possible.

The CO_2 content of

the gases, while not having any relation to the *weight* of excess air with which combustion has been effected, nevertheless has a definite relation, for any particular coal, to the *percentage* of excess air with which such coal has been consumed.

The air quantity supplied for combustion was therefore controlled by the CO_2 indications, checked by the Orsat set, and conditions were set to maintain as nearly as possible 12.0 per cent. CO_2.

When conditions throughout the unit were stable, a series of readings, taken at short intervals, was made of CO_2, steam flow, and pressure drop. The test periods were from one to two hours, and at the end of the period the average was taken as being representative of the conditions under which the test was made.

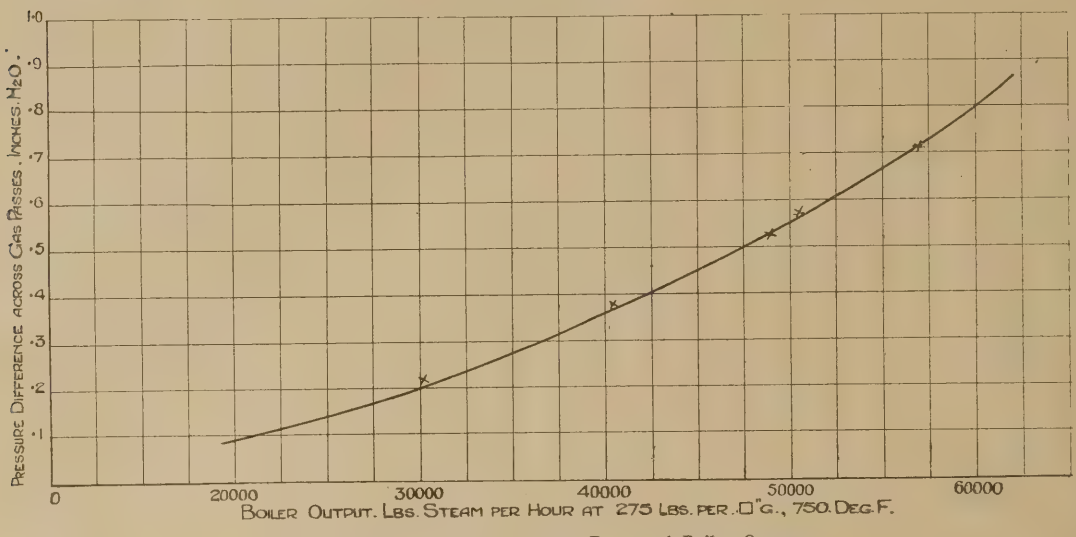

Fig. 8.—Relation between Pressure Drop and Boiler Output.

It was found that with stable combustion conditions the variations in CO_2 and pressure drop were negligible, and though the steam flow meter indications varied, the variations were only of the order of 2,000 to 3,000 lb., and were possibly caused by irregularities in the operation of feed-water regulation.

After the first test run, the pressure drop and the corresponding output of the boiler in lb. of steam per hour were expressed graphically. This point is that on the lower curve of fig. 6, corresponding to 50,000 lb. per hour output and a pressure drop of 0.395 inch of water.

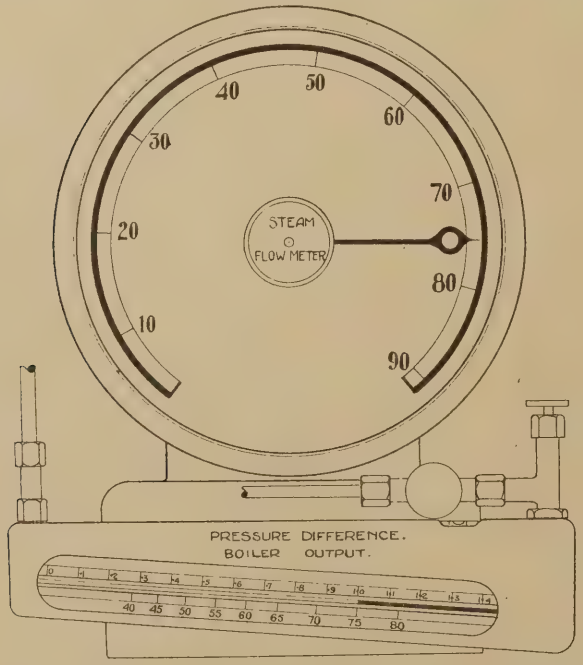

Fig. 9.—Combination of Steam Flow Meter and Differential Pressure Gauge.

From the information thus obtained, the theoretical pressure drops for other outputs were calculated. Plotting these values gave, for this particular boiler and operating conditions, the lower curve of fig. 6.

The output of the boiler was then altered by stabilising another set of combustion conditions, but still maintaining the same coal/air ratio.

It was found that once stable conditions were set, the new actual pressure drop coincided with that particular point of the theoretical curve.

Different outputs covering the commercial range handled by the unit were tried as described, and in every case the pressure drop varied in a definite relation to the output.

The results of the tests are shown in figs. 6, 7 and 8, the actual test results being plotted as crosses against the theoretical curve deduced from the first measured pressure difference.

To further prove the relationship with other air conditions the air quantity was increased to a value corresponding to a reduction to as nearly as possible 11.0 per cent. CO_2.

A series of tests was again made, and the results of these are expressed in the upper curves of figs. 6 and 7.

The application of this operating information necessitates a separate calibration test on each boiler unit. One or more tests are made under the best conditions that can be maintained, the pressure difference corresponding to, say, the commercial range of steam output of the unit are then calculated, and thus a standard of performance is set up which gives the operating staff something definite to "shoot at."

In the case in question, this was done by calibrating an extra scale for the differential gauge in terms of output corresponding to pressure drop, and the gauge and flow meter were then mounted together so that both their indications were observable at once. This assembly is shown in fig. 9.

This arrangement provided what is really one instrument, immediately susceptible to the least change in the operating conditions, the only other items requiring a certain proportion of the operator's attention being the final temperature of the flue gases and the prevention of combustible being carried over by the ash discharged from the grate.

It should, of course, be pointed out that there are reliable instruments on the market which can be installed for the purposes outlined in this article, typical representatives being the Bailey boiler meter, and the combination of steam and air-flow metering instruments produced by Electroflow Meters, Ltd.

Electrical Location of Ore Deposits.—Dealing with some practical points concerning the electrical location of ores, at a meeting of the Swedish Mining Association at Orebro last week, Mr. Sven Lundberg, of Stockholm, is reported to have stated that methods for the electrical discovery of ores have now reached such development that it is possible to localise a conductive ore body, and also ascertain the form of the ore, calculate its depth, and form an idea whether the indications received denote a compact ore or a conductor of a stratified nature. After referring to the discovery of copper ore by electrical means at Bjurfors in Vasterbotten and the Boliden ore in the same district, the author says that the method is very economical. At the same time the work is so complicated that it requires a specially-trained staff. Under these circumstances an organisation has been formed for the development of electrical research under the title of the A. B. Elektrisk Malmletning. The speaker added that it could not be denied that many of the efforts made in Sweden in connection with the electrical surveying of ore had totally failed, the interested parties having materially over-estimated the general applicability and range of the electrical methods.

The "Electrolux" Refrigerator.

An Interesting Development of the Platen-Munters System.

THE above-named refrigerator is unique in that it is a contrivance for continuously producing cold without the aid of any mechanical moving parts. Its simplicity is an indication of its reliability in service, while it is impossible for the user to upset the action.

The appearance of the finished article is shown by fig. 1; as will be evident from fig. 2, the essential

Fig. 1.—The "Electrolux" Refrigerator.

apparatus consists of three cylindrical iron vessels connected by iron pipes, charged with distilled water, ammonia, and an inert gas (such as hydrogen), the whole system of pipes and cylinders being welded together and thus hermetically sealed to prevent the escape of their liquid or gaseous contents.

Means are provided for heating one of the cylinders, electricity being of course the most convenient agent for this purpose, and a small quantity of cold water is allowed to flow over one of the other cylinders and also around one of the connecting pipes, cold being continuously produced in the third cylinder so long as the supplies of heat and cold water are maintained. The liquids and gases are used over and over again and will last indefinitely.

The inventors have ingeniously contrived to entirely overcome the difficulty (due to the pressure difference) which is encountered when an attempt is made to circulate a refrigerant. Taking advantage of Dalton's law, according to which the total pressure in a vessel containing a mixture of gases is the sum of the pressures which would be exerted if each of the gases occupied the same vessel alone, they have introduced an inert gas (hydrogen) into the low-pressure side of the apparatus, the effect of which is to raise the total pressure on the l.p. side so that it equals that on the h.p. side; the pressure is practically uniform in all parts of the apparatus, and consequently circulation is set up by the application of heat to one part of the system.

The evaporator is shown on the left in fig. 2; on the right, outside the cabinet, are the generator and absorber with the rectifier and condenser at the top and the heat exchanger at the bottom. It is advisable to place the evaporator in a tank containing a liquid of low freezing point (salt and water) which will act as a "cold" accumulator and make it unnecessary to maintain the continuous operation of the refrigerator. This cooling tank is so arranged that small trays containing water can be inserted in it for the formation of ice for cooling beverages, &c., for household use.

The process of refrigeration is as follows (see fig. 3): When the mixture of ammonia and water in the generator (1) is heated, the ammonia is driven off into the pipe leading to the evaporator (3); the water vapour is condensed in rectifier (9), which is provided with metal fins, and falls back (due to the inclination of the pipe) into the generator (1). The ammonia gas is further cooled and condensed in the water-jacketed condenser (4) and in falling on to the disks (14) evaporates and mixes with the hydrogen which enters through pipe (12). The mixed gas is now heavier than pure hydrogen, and so falls to the bottom of the evaporator (3), whence it is conducted through pipe (13) into the absorber (2).

The evaporation of the ammonia gas in the evaporator results in a great lowering of its temperature, which, in turn, cools the non-freezing solution around it and the chamber in which it is situated. The lower the pressure of the ammonia gas, the lower will be the temperature. As previously explained, the *total* pressure is the same as in the generator, but by introducing sufficient hydrogen gas to produce the greater part of this total, the ammonia pressure can be only equal to the difference. A reduction of the ammonia pressure with the consequent lowering of temperature is thus obtained.

Returning to the generator, the weak liquid remaining in (1) after the ammonia gas has been driven off flows through pipe (5 and 11) into the water-cooled (10) absorber (2) due to the difference of levels in the two vessels and in falling over the disks (15) it rapidly absorbs the ammonia gas that is with the hydrogen, thus allowing the lighter hydrogen to rise and pass again through pipe (12). The strengthened ammonia liquid flows out at the bottom of (2) and is preheated at (5); it is then boiled in the coil (7) (which surrounds the heating medium (6) and the gas bubbles so formed result in a pumping action sufficient to lift the liquid from the absorber (2) to the higher level (8) of the generator (1). The invention is of Swedish origin, but we understand that Messrs. Electrolux, Ltd., intend to manufacture the refrigerator in this country. A demonstration was given at the Savoy Hotel on Tuesday by Dr. Hele Shaw, F.R.S. Major H. A. Wernher, D.S.O., presided. Further reference to the matter will be made next week.

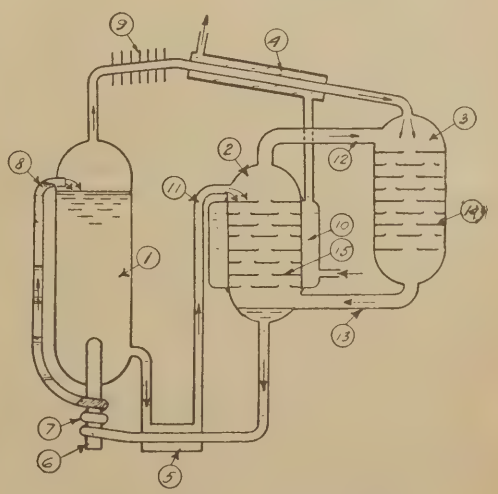

Fig. 3.—Diagram of Circulating System.

Electrical Freedom—The Contractors' Creed.

By L. L. ROBINSON, M.Inst.C.E.

No supply engineer who enjoys a little innocent humour should be content until he gets a copy of the flame yellow pamphlet published by the Electrical Contractors' Association, entitled "Electrical Freedom."

On the first page the contractors' creed is set forth:—

We believe wholeheartedly in the need for ample, cheap, and uniform Public Supplies of Electricity.

We believe that such public supplies of electricity should be under Public Control; that such supplies of power should be under State or semi-State Direction or Regulation.

We do not believe that Public Control or Public Trading should extend beyond the provision of such ample supplies of the Power itself.

The pamphlet does not say why the electricity supply industry should be under public control, but the supply of installations and fittings under the control of the electrical contractors only.

Surely, if the supply of electricity is to be cheap and abundant, the installations must be cheap and abundant also. All the newer uses of electricity must be catered for as energetically as lighting. The contractors are alive to the fact that the municipalities give the cheapest and most efficient supplies of electricity; is there any sound reason to suppose that they or the companies cannot likewise supply the cheapest and most efficient installations and service to consumers?

On the contrary, certain outstanding examples have shown that the consumer gets the best service where the supply authority takes the responsibility for the complete service to the consumer. In the very successful undertakings of the United States, the supply authorities are laying greater and greater stress upon the necessity for the supply authority to look after all the consumers' needs. The contractors need only read the American technical Press to find this out for themselves.

The humorous side emerges from the examples of other services used by the authors of the pamphlet to show why installations should not be provided by the supply authorities, such as the following:—

"We believe, for example, that the provision of adequate water to meet the Public needs should be in the hands of Public Authorities under Public Control.

"We do not believe that plumbing work, the sale and installation of domestic pipe lines, boilers, baths, kettles and other water conveying or using apparatus should be undertaken by Public Authorities.

"We believe that such Retail Trading should be in the hands of existing plumbers and ironmongers, who already handle such water-conveying and water-using goods."

What an unfortunate example to take! Water supply is an absolute necessity and monopoly. Electricity is not an *absolute* necessity. However desirable its use may be, it is by no means a monopoly, since light, heat, power, &c., can be supplied by other means.

Water is usually supplied at a fixed annual charge based on rateable value. Obviously, the less water used the better for the water supply authority. With electricity the reverse is the case.

When the piping is done by "existing plumbers," the water supply authority's desire for economy in use is usually served by the plumbers' anxiety to use the smallest possible pipes and the cheapest possible fittings.

My own London flat is a beautiful example of this. I live on the third floor. All the hot-water cisterns are served by an inadequate common feed pipe from the cold-water tank in the attic. The cold water goes in at the bottom of the tank and the supply to the bath also goes from the bottom of the tank; it should go from the top, but as the supply pipe is so small, the expedient of taking it from the wrong place was resorted to by the "existing plumber." A second bath-full is not available until some considerable time after the first one has emptied the inadequate hot-water cylinder.

If a resident in a lower flat uses water as fast as he can, he gets my hot water (or rather he did, until I put a non-return valve in), because the feed pipe is too small to supply him adequately from the cold tank.

Yet do not contractors for electrical wiring do much the same thing, namely, put in wires so small to lighting points that when the inevitable iron, kettle, vacuum cleaner, or small radiator comes along they are found wanting, and the installation has to be done again?

No!—the case of water will not do to illustrate the ideal method of dealing with electricity.

Why is the gas industry not taken as an analogous example? Is it not because all, or nearly all, gas supply undertakers have realised that they could not for a year withstand the electrical competition if they did not provide complete service of gas and installation work for their consumers?

The contractors, at last, believe in assisted wiring and hiring. A welcome change—but only if it brings grist to their mill without effort on their part. But do they really want it? I have prepared a schedule of prices which show a good profit on my costs and on which I will willingly give out a very considerable amount of work to registered contractors. Several have had orders on this schedule, but only one or two contractors are glad to have them and ask for more—others won't touch the work unless they get a higher price. The electrical contractors state that installation work is not fitted for public bodies, and that public bodies cannot do this work efficiently. How does this fit in with the fact that there is not a rush for my work at prices which show at least 20 per cent. profit on my costs, and in connection with which the contractors would have no business-getting costs or financial risk?

If I, as a public servant, am inefficient, a price which shows 20 per cent. on my cost must produce a far greater profit on their efficient work, so they ought to be scrambling for my orders!

In my area the united efforts of the retailers did not connect four vacuum cleaners per month to my mains. That did not satisfy me, so I started to sell vacuum cleaners on up-to-date lines. I am thereby connecting about 27 per week, and doubtless the contractors are doing better than they did since I have sold the vacuum cleaning idea to the public.

Of course, they are crying out now about the business I am taking from them. Nonsense! I have made a new business that they dreamt not of. If I had told them a month ago that the district could absorb this quantity of vacuum cleaners they would have laughed at me.

What have the contractors done in other lines than lighting and fittings? In my area this is not an unreasonable statement of their record:—

Vacuum cleaners.—Very little.
Washing machines.—Nil.
Power.—A little—after the undertaking had well sold the idea to the manufacturers.
Coking.—None. Water heating.—None.
Heating.—Some. Domestic refrigerators.—None.
Factory uses other than power.—None.

Who is going to sell my product fast enough to make it ever cheaper and ever more abundant if I do not go in and look after the service and selling myself?

The contractors have not done it in the past. Could I trust the future to them? I fear not, and, therefore, I must continue to sell the means of selling my product myself, lest the business be doomed to stagnation. No supply engineer wants the worry of a sales department. If the contractors had energetically pushed the sale of electricity for all purposes the supply authorities would have been well content to leave the work in their hands.

But sales were slow, and largely restricted to the lines which sold most easily, without systematic canvassing, &c., so the electricity supply engineer, like the gas supply engineer, was forced to take a hand in a business which has been more than adequately justified by the results achieved. After all, the proof of the pudding is in the eating.

The British Industries Fair.—III.

Electrical Features and Meetings.

WEDNESDAY, February 17th, was "Electrical Industry Day" at the Birmingham section of the British Industries Fair. Six associations of the industry were represented as well as 20 supply undertakings, both company owned and municipally owned, and all were potential buyers. Representatives were present from the Incorporated Municipal Electrical Association, the Institution of Electrical Engineers, the Association of Mining Electrical Engineers, the Provincial Electric Supply Committee of the United Kingdom, the Association of Electric Power Companies, members of the Birmingham Electric Supply Committee, and a number of exhibitors and others attended and among whom were the following:—Sir Hugo Hirst, Dr. Railing (G.E.C.), Mr. Barnard (Callender's), Mr. Tippetts (British Electrical Federation, Ltd.), Mr. Lumley (N.P.L.), Dr. Kaye (N.P.L., Mr. Legge (Shropshire Power Co.), Mr. Beauchamp (E.D.A.), Coun. J. Hewitt (St. Helens Corporation), Coun. G. Beaumont (Huddersfield Corporation), and Messrs. Cossens and Coulthurst (South Wales Power Co.). Councillor H. E. Parkes, President of the Birmingham Chamber of Commerce, presided at a luncheon. We reproduce a group photograph taken subsequently (fig. 6).

Fig. 6.—Representatives of the Electrical Industry at Castle Bromwich.

Mr. T. R. MARTIN (of Messrs. J. H. Tucker & Co.), vice-chairman of the Fair Management Committee, pointed out that that was the first official electrical visit in connection with the Fair. For the first time, the display of the electrical industry was of a representative character, something like 80 firms being exhibitors. That Section of the Fair was national and not local in its outlook, and the organisers were hopeful that the exhibitors and others identified with the industry, would become annual participants. The one object of the Fair was to promote British trade, and to attract overseas buyers. Such a Fair held annually in unbroken continuity should be a real asset, for business could be done in a proper atmosphere, and under conditions which enabled manufacturers to show their products to the best advantage. He knew of no other industry that was better served by its Press, and the organisers of the Fair owed to them a particular debt of gratitude for their help. He thought they would do a good service to the industry if they went to Leipzig and told manufacturers all about it. They entertained the hope that they would be able to make the Fair at Birmingham a world market, for at least two weeks in the year.

Sir HUGO HIRST, in proposing "The Electrical Industry," observed that that industry was becoming a very powerful factor in our industrial and social life; and the manufacturer could look squarely in the face any manufacturer from any other country. If they were to "deliver the goods" the whole industry must work together as a team. The experience of all engaged in it must be put into the common pool. Manufacturers were doing much and spending large sums of money in the field of research. Every industry would be rejuvenated if electricity was properly introduced into it. He asked those present to welcome the forthcoming Electricity Bill. There might be details in it, with which some would disagree; there might be important points of details which they would like to see altered. Nevertheless, the object of the Government in introducing the Bill was in order that real service might be given to the country, and he believed that the ultimate result would be that electricity would do for this country what steam did for it one hundred years ago.

Mr. R. A. CHATTOCK (President of the Institution of Electrical Engineers), in responding to the toast observed that Sir Hugo Hirst had referred to the value of collaboration between the supply side and the manufacturing side of the electrical industry. That point had not been lost sight of and a joint committee of the two interests was doing useful work in trying to ascertain the views of both sides across the table with regard to the design of electrical machinery, steam generators, &c. He thought that form of collaboration was most valuable to the industry and it was a point for satisfaction that both supply undertakings and manufacturers were represented at the Fair. He put forward an earnest appeal to the supply branch to support the British Electrical and Allied Industries Research Association, because it was out to benefit quite as much as the manufacturing side by the work that was being done. The Institution of Electrical Engineers was anxious to give the Government's electricity measure all the support possible. They wanted a scheme that would not only cheapen the cost of supplies in the country but would extend the use of electricity. He thought they could whole-heartedly support the Government in that ideal. The method that were proposed must be open to criticism but as they had not yet had an opportunity of seeing the Bill they did not know what the financial proposals were. He thought that they ought to be glad that the Government was not going to subsidise the in-

Fig. 7.—A View of the Electrical Section.

dustry, because subsidies meant control of some kind and they in the electrical industry did not want to be unnecessarily controlled. They were carrying on very well now and he thought they could develop in the future on the lines the Government wished, without control. He considered that railway supply should be included in the scheme.

Mr. R. B. Mitchell (President of the Incorporated Municipal Electrical Association) also replied, and endorsed what Mr. Chattock had said with reference to the joint work of the committee representing supply undertakings and manufacturers. Regarding the condition of the industry and the satisfactory export position, he expressed the hope that before long an equally good report would be forthcoming so far as the home trade was concerned. On the supply side he thought it was correct to say that fair progress was being made in nearly

Fig. 8.—The Corporation's Mercury-vapour Rectifier Substation.

Fig. 9.—A View of the Birmingham Electricity Supply Department's Stand.

every undertaking. In Edinburgh they had doubled their output during the past few years and very good headway had also been made in Birmingham and Manchester. In Glasgow the lighting load showed a substantial increase. He agreed that railway electrification was a necessary adjunct to the scheme as a whole and he was hopeful that the railway companies would come into line.

Reverting to the exhibits, we continue below our description of some of the stands and reproduce (on p. 329) a view of a section of the electrical display (fig. 7).

The Birmingham Electric Supply Dept.

As previously reported, one of the principal exhibits of this Department is a mercury arc rectifier sub-station of 184-kW capacity, as used in outlying areas to convert 5,000-V, 25-cycle, three-phase alternating current to direct current at pressures of 220 V and 440 V for distribution to consumers for lighting,

Fig. 10.—The G.E.C. Stand at Birmingham.

power, heating and cooking purposes. This is illustrated in fig. 8. A sub-station as installed by the department on larger consumer's premises is also shown, including high- and low-pressure switchgear, and a 100-kW transformer to reduce the pressure from 5,000-V, 25-cycle, three-phase a.c. to 440 V, 25-cycle, three-phase for power, and 110-V, 25-cycle, single-phase for lighting purposes. Another exhibit is an electrically-driven boiler scaling outfit complete with a small motor, and mounted on a trolley to enable it to be moved from point to point; also a similar machine especially suitable for scaling condenser tubes. A double spindle pedestal-type polishing machine is on view, the polishing mops being carried on the shaft of the 1½-h.p. motor supplying the power. There is also a plating outfit, the power being furnished by a 5-h.p. motor generator set. Among the electric tools shown are a bench drill of ½-in. capacity, with a motor suitable for working on either d.c. or a.c.; and a chipper suitable for breaking concrete, steel chipping, riveting, &c., operated by a 1-h.p., 220-V, d.c. motor. A static condenser is shown controlling the power factor of a squirrel-cage motor, thus demonstrating the apparatus required to improve the power factor on large consumers' installations, thereby entitling them to the special discounts allowed by the Department. The effect of switching on the condenser is shown by the operation of a special power factor meter. Four automatic electric furnaces are shown by Automatic Electric Furnaces, Ltd., suitable for working on 220 V d.c., and fitted with automatic temperature control as follows: (1) Internally-heated resistance furnace for annealing iron, copper, brass, nickel, aluminium, silver, &c., also for enamelling and carburising (load 23 kW); (2) a 3-kW oven suitable for tempering tools, &c.; (3) a 3-kW automatic tool-hardening furnace complete with magnetically-operated device for indicating the exact point when an operation is finished; and (4) a 9-kW furnace for hardening high-speed steel, &c. A 6-kW, 220-V, coffee boiler, capable of dealing with large supplies at café rush hours, is exhibited. A small electric coal-cutting machine is also shown, and in addition, there is a representative supply of lighting fittings, various types of electric fires and heating apparatus, fans, irons, cookers, and modern labour-saving appliances. A view of the stand appears in fig. 9.

General Electric Co., Ltd.

This company's exhibit was dealt with in our last issue. This week we reproduce a photograph of the stand (fig. 10) which was received too late for insertion with the description. The stand occupies practically the whole of one wall of the building "C," in which the bulk of the electrical exhibits are housed.

George Ellison.

A great deal of heavy switchgear is shown on this stand, apart from a working exhibit on an adjacent stand from which a mercury-arc rectifier sub-station provides power for the building. A prominent exhibit is a two-panel unit-type draw-out l.p. switchboard, comprising a 250-A and an 800-A circuit breakers with the usual no-volt and overload releases, adjustable time-limit attachments and tank lowering gear. Mechanical interlocking arrangements ensure that the breaker is open before it can be withdrawn or replaced. The units are mounted on tubular stands and are bolted together to form a continuous switchboard. A h.p. panel is also shown; this is illustrated in fig. 11. It is an oil-immersed free-handle draw-out equipment rated at 200 A and 3,300 V. It consists of a main circuit breaker fitted with no-volt and direct-acting overload time-limit release coils, fully interlocked tank-lowering gear, and instruments all mounted on tubular stands. Another apparatus on view is a three-way l.p. lighting board specially suitable for collieries and other exposed positions. It comprises three 40-A oil-immersed free-handle d.p. circuit breakers, each provided with two overload release coils and various forms of cable boxes. Other exhibits are a 150-A l.p. flameproof oil circuit breaker; a 100-A l.p. air-break, triple-pole, explosion-proof, gate-end breaker with free handle, three overload time-limit release coils, cable box and reversing plug, the whole mounted on skids; a l.p. air-break, air-cooled stator and rotor control panel, consisting of a mill-type free-handle breaker provided with the usual automatic features, mechanically interlocked with a non-automatic air-cooled rotor starter; a l.p. oil-immersed and cooled stator and rotor control panel; a l.p. oil-immersed auto-transformer starting panel with a change-over switch and correct-sequence device; a l.p. 20-A, totally-enclosed, oil-immersed, star-delta starter; a l.p. drum-type reversing controller; a d.c. drum-type reversing controller with

patent magnetic blow-out system and roller contacts; a resistance frame; junction boxes, &c. A patent double-valve time lag device is shown for the first time. This is designed to provide a sufficiently long delay under the overload due to the starting current taken by a squirrel-cage motor while giving the desired delay with normal overloads. There is a hollow piston which houses a valve mounted on the same stem, a spring being provided between the piston and valve to keep them apart normally. With currents up to about twice normal in the overload coil this spring holds the piston and valve apart, leaving the clearance between them in addition to the ordinary clearance between the piston and the cylinder for the

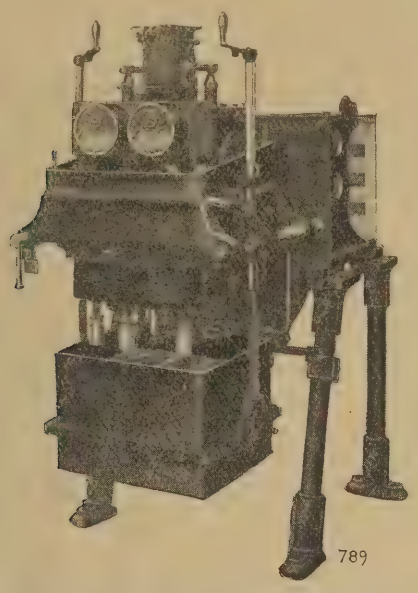

Fig. 11.—An Ellison 3,300-V Draw-out Unit.

passage of the oil, thus reducing the retardation. With currents exceeding about twice normal the pull on the overhead core is sufficient to compress the spring, bringing the valve on to its seating in the piston and leaving only the clearance between the piston and the cylinder for the passage of the oil. This clearance can be adjusted in the ordinary way by screwing the cylinder up or down relatively to the piston, the retardation being so lengthened or shortened.

A section of the stand is devoted to a display of a new synthetic resin impregnated paper insulation. This is used by the firm in its switchgear and is available for other firms who require it. In appearance it is chocolate coloured and has a very fine surface. It is easily machined, although it is too hard to stamp. Excellent dielectric properties are claimed for it.

The Siluminite Insulator Co., Ltd.

Prominent on this firm's stand is the dog safely seated on a live rail, which is a feature of most of its advertisements. A variety of switchboard panels ranging from sizes suitable for power work down to small panels for radio sets, are exhibited. Several of these are in special colours, as white and blue enamel. Samples are shown of the new "Grade 2" insulating material which has recently been placed upon the market. This is able to withstand a certain amount of arcing without carbonising, and on this account is very suitable for switch bases with divided fillets moulded in one piece, and for the insulation of core plates. The company is showing a further new material which is at present under test. This is known as "Arcovite Grade 2." The growing use of overhead power lines in this country gives added interest to a special type of bird guard which the company exhibits. This guard will not cause a short circuit in the event of birds coming in contact with the overhead lines. It is mechanically strong and easily fixed. The remainder of the exhibit is composed of track insulators of various designs as supplied to leading railways, sections of insulating material in different grades for overhead line insulators, arc shields, finger shields, and tubes and rods of the company's various materials.

Siemens & English Electric Lamp Co., Ltd.

The lighting on this stand is carried out with Siemens gas-filled lamps in "Silvaray" fittings, which are suitable for shop window illumination. Apart from this "working" exhibit, the company shows a selection of "Siemens-Xcel" domestic electrical appliances; the cooker (fig. 12) is a new design. It is a standard upright type of cooker with a hob mounted on the top of the oven. Under the hob is ample space for warming plates and grilling. The hob has two special type boiling plates and a 3-heat grill with a removable damper. The oven measures 15 in. x 16 in. x 16 in., and is equipped with elements of 2,100 W; the total loading of the appliance is 6,900 W. The boiling plate consists of a special circular fireclay plate, 7 in. in diameter, in which are deep grooves which house the nickel chrome spirals. The plate is well perforated to allow escaping liquid to pass through it, and is held in place by a novel cast-iron support provided with three plug-in terminals which engage with sockets mounted on the side of the cooker. A white enamel crown plate slides under the hob to collect anything that is spilt. The entire boiling plate can be instantly removed and replaced. There are also shown various types of irons; electric fires, including bowl fires, well fires, and the standard up-

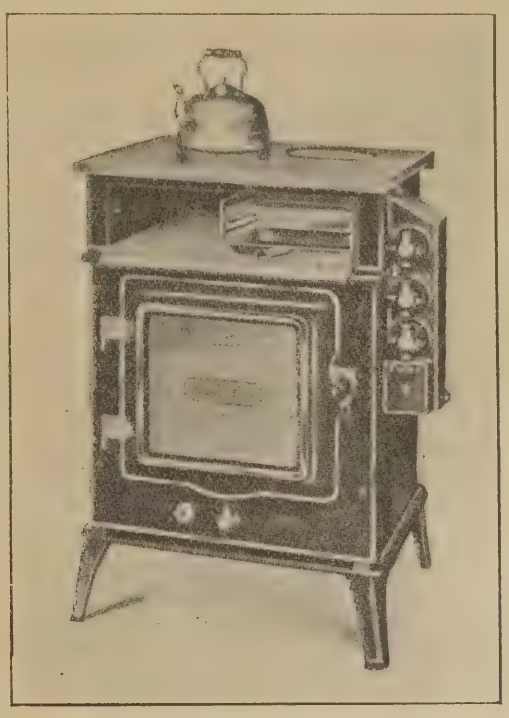

Fig. 12.—The "Siemens-Xcel" Cooker.

right types; electric table cookers; and boiling plates and kettles. The exhibit is rounded off with a display of Siemens "Zed" fuse materials.

Premier Electric Heaters, Ltd.

This company has, as usual, a very attractive display of domestic electrical appliances, all of which are notable for their high degree of finish. Electric fires are one of the chief items, and this year's display includes a range of new designs. These, as will be noted from the example illustrated in fig. 13, have the elements mounted horizontally at the foot of a highly-polished reflector back, which is extended underneath the fire-bars to the front of the appliance. A new form of fire-bar is employed. This consists of a strongly-made fireclay former of double radius, which gives a fairly wide distribution. A large number of kettles are shown, in

Fig 13.—A New "Premier" Fire.

polished and nickel-plated copper; these are fitted with the fusible-plug safety device which we described in connection with last year's Fair. This device is also fitted to some electrically-heated glue pots which are exhibited. For the rest, the exhibit consists of "Smoothwell" irons, hot-plates, urns, saucepans, and many other household appliances.

The National Gas Engine Co., Ltd.

The main feature of this display is a newly designed 66-b.h.p. crude-oil engine, self starting from cold, complete with compressed air starter consisting of an independent engine compressor and receiver. It is suitable for working with the cheapest fuel oil and with minimum compression and low average pressures. A 7-kW generating plant is shown arranged as an automatic engine-driven sub-station for use in connection with d.c. distribution systems where h.p. alternating current is not available. This plant is entirely automatic in its working, and should prove of value to central station engineers. The plant consists of an engine driving a compound-wound generator together with a starting motor and battery. The switchgear is automatic, the controlling feature being a current relay and feeder circuit. When the current in the feeder reaches a pre-determined amount, this relay contacts and the sub-station generating plant is automatically started up, and as soon as its voltage exceeds that of the feeder they are paralleled and the sub-station takes the local load, any excess current being fed back to the main generating station. The plant is shut down again when the local load is reduced to a pre-determined minimum. A 3-kW generating plant with automatic switchgear, is also shown. The electrical portion of the equipment has been made by the Austin Lighting Co., Ltd.

Young, Osmond & Young, Ltd.

This firm's stand is devoted to the display of the "Lightfoot" tubular electric heating system. This is a low-wattage method of heating in which tubes are loaded to 40, 50 or 60 W per foot run, giving temperatures of 160, 180 and 205 degrees F. respectively. The tubing can be fixed round the skirting boards of rooms or corridors, and also made up into appliances. Among the latter are towel rails, garage and car heaters and electric window heaters, examples of which are exhibited on the stand. This is an economical and safe system of heating, and the elements are guaranteed for 5 years.

A. W. Beuttell & Co., Ltd.

Examples of the "Linolite" reflector are shown by this firm, made up for various applications, including shop window lighting, picture lighting, portable showcase lighting, &c. The "A.A." clip is another exhibit. This is an adjustable earthing clip which can be used for pipes varying in diameter from ½ in. to 1¼ in. The same clip can also be used over a rubber band to form a joint between water pipes.

K. F. M. Engineering Co., Ltd.

This exhibit consists of examples of "Internalite" electric signs. These are of distinctive design. Hidden in a small framework are standard type tubular electric lamps, from which light enters the edge of the glass plate affixed to the tube, and is invisibly transmitted between the polished surfaces of the glass by internal refraction. This only becomes apparent when it is reflected by the lettering or design upon the glass which it illuminates, producing a striking result.

Electric Fires, Ltd.

A very representative collection of heating apparatus is shown by this company. One of the principal features is a number of "Electricoal" fires in various designs and finishes. These fires consist of an art-metal grate packed with a realistic imitation of glowing coals. At the back is a polished metal reflector, and heating elements are fitted at the front. The elements are composed of 1-kW plug-in bars, which consist of formers of a dark-red refractory material wound with nickel-chromium wire in a continuous coil. A large number of different patterns of immersion heaters are shown with loadings ranging from 50 W to 12 kW. The latter size is employed for warming Diesel-engine oil to reduce its viscosity. Some of these immersion heaters are made up as self-contained units complete with a snap-switch and plug and socket. Low-temperature heating is represented by examples of finned cast-iron radiators, suitable for installation in garages or other places where radiant heat is not desirable. Other exhibits are bowl fires, treble-purpose cooker-radiators, sample elements, &c.

J. H. Tucker & Co., Ltd.

This company, which is a regular participant in the Fair, has a comprehensive display of its electrical accessories. Among the heavier equipment shown are cast-iron cased combined switches and fuses, knife switches and distribution boards. All types and finishes of tumbler switches are on view, as well as plugs and sockets of distinctive design. The latest products are a new range of tumbler switches of the quick-make-and-break pattern, and grid boxes for sinking switches into a wall. The former include a number which have withstood severe tests at Faraday House and have only broken down when their normal current and voltage ratings have been doubled or trebled. A 5-A switch of this type is shown controlling a fire taking 15 A. The switch box has a grid to which the front plate is secured by four adjustable pins. It is thus possible to make the plate come flush with the wall with little trouble. Other exhibits are examples of multi-way switching, "Kwikwire" plug-in terminals, lampholders, &c.

The London Fair.

Illuminated Signs.

An interesting collection of exhibits of devices for advertising purposes has been brought together in the "General" section, near the Wood Lane Entrance. The one feature common to all of these is motion; in other respects they are "of infinite variety." Amongst those employing electricity are the Attracta Electrical Co., showing various mechanical, thermal, and gravitational devices, flashers, &c., many of which are operated solely by the heat from a small lamp; Messrs. Marathon, Ltd., showing the "Runsyne" machines; the Autochrome Signs, Ltd., showing a large variety of signs; Mr. T. J. Gabb, and the Brilliant Sign Co (1907) Ltd.

Engalithic Mfg. Co. (1925), Ltd.

This company shows "Engalith," a non-inflammable composition of the casein type, which is made in sheets and rods of any colour, and is suitable for electrical insulation as a substitute for ivory, ebonite, &c.

Shades and Fittings.

Several stands are devoted to exhibits of shades for electric lamps, mainly of the silk-on-wire type. Messrs. S. L. Miller and Co. have a very attractive range of shades to meet all tastes, and specialise in hand-painted designs; Messrs C. O. Goring show vellum lamp shades, bound with leather thongs, cemented, or stitched; Messrs. Henry Harvey & Co., Ltd., show mother-of-pearl articles, including shells for use as reflectors; Messrs. Waite & Son have a great variety of silk and linen shades. Messrs. F. Parks, Ltd., besides silk shades, show charming hand-painted flaky vellum shades, laced with leather, as well as colour-washed and perforated vellum shades, and their new "crackle" designs on jap silk.

Metal and glass fittings of handsome design are on the stand of the Pearson Page Co., Ltd.

Ever Ready Co. (Gt. Britain), Ltd.

A large stand is occupied by this company with stacks of its well-known dry cells and batteries of every description. A notable feature is a high-pressure wireless battery in a metal container; this is put up in the most popular sizes, up to 126 volts, and is considered proof against rough usage.

Marconi's Wireless Telegraph Co., Ltd., and the Marconiphone Co., Ltd.

These companies have two stands showing their numerous designs of wireless transmitting and receiving apparatus to advantage, as will be gathered from the accompanying illustration, fig. 14. A prominent feature of the exhibit is the "Straight-8" set, which has been designed to combine the maximum range and selectivity with pure reproduction and

Fig. 14.—The Marconi Stand at the White City.

ease of manipulation. It comprises eight valves—five h.f. and two l.f. amplifiers and a detector. No reaction is used. It is claimed that with this set within one mile of the London station Bournemouth can be received without interference. At night all the Continental stations can be received, and usually the American stations also.

British Electrical Sales Organisation.

We called at this stand just after the King had visited it. His Majesty having used the company's "Rolls" portable wireless set to hear the opening of the Fair by the Prince of Wales. This model, which includes a small loud speaker, weighs 20 lb., and measures 15 by 11 by 7 inches; it has a range of 25 miles, or, with 'phones, 75 miles, and is entirely self-contained. A larger set is made with a mahogany cabinet. Another exhibit is the "Beco" de luxe loud speaker, which is of very neat design, without a horn. Many other patterns are shown on this stand.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

"Do Not Annoy the Editor."—We are indebted to a writer in the current issue of the *Newspaper World* (the column of notes on "Technical, Trade and Class Journals" for the following:—

"This heading was prompted by the remarks of the editor of a certain well-known weekly journal as he slammed the telephone ear-piece on to its hook. 'That confounded contributor,' he said, 'worries me by 'phone, letter, reply-paid telegram, and in person. He sends me a 500-word article by post, follows it up in person to know if it suits, 'phones me as to proofs, and generally makes himself a nuisance. He's a capable man, but I'm dropping him.' Do not be over-anxious to please, ye free-lances!"

The E.C.A. Conference at Brighton.—We are informed that preliminary arrangements for the first annual conference of the E.C.A. and Allied Associations, to be held at the Royal Pavilion, Brighton, on Thursday and Friday, June 24th and 25th, are well in hand, and that there are indications that the event will prove an outstanding success. The present outline arrangements are as follows:—The conference will open on Thursday morning with an address of welcome by the Mayor of Brighton, followed by the E.C.A. presidential address. Later the E.C.A. annual general meeting will be held. On Thursday afternoon there will be papers and discussions on matters of immediate interest to the supply, wiring and sales sections of the industry. During the evening there will be a smoking concert in the music room. On Friday morning papers and discussions will be heard on "Apprentice Training," "Registration," and other matters of vital trade interest. At the close of the business session there will be a short address by the new president for the year 1926-1927. In the afternoon there will be a garden party in the Royal Pavilion grounds, followed, in the evening, by a ball in the Royal Pavilion rooms. A final and detailed programme will be circulated shortly, together with particulars of railway and hotel arrangements.

Unemployment.—On February 8th, the total number of unemployed registered at the Employment Exchanges was 1,164,900, representing a decrease of 10,078 during the week and one of 78,060 during the preceding 12 months.

Municipal Retail Trading.—The Doncaster Corporation is to promote a Bill in which application is to be made for powers to enable that Corporation to sell electrical apparatus. This has aroused keen opposition locally, and the Electrical Contractors' Association has issued a statement in the course of which it is stated: "It is grossly unfair that public funds should be used to set up retail trading competition against existing private traders and that capital raised on the security of the rates should be used in direct competition with rate-paying traders. British electrical engineers and contractors are skilful, competent and enterprising men fully capable of dealing with all the electrical wiring and electrical sales needs of the nation. These men have established businesses all over the United Kingdom, and it is grossly unfair that their pioneer efforts for the past thirty years on behalf of British electrical development should be brought to utter ruin as a consequence of municipal rate-aided trading."

Ship Lighting.—We are informed that the recently-launched R.M.S.P. *Asturias*, which is the largest motor ship yet built, is illuminated throughout with "Siemens" electric lamps.

Orders for British Plant.—Among the orders recently received by members of the British Engineers' Association are the following:—The Royal Mail liner *Asturias*, the largest and most powerful motor liner in the world, has been equipped by the Marconi International Marine Communication Co., Ltd., with one of the most complete wireless installations carried by any ship afloat. This installation will enable the ship to keep in constant communication with land stations and other vessels throughout every voyage. In addition two of the lifeboats carry Marconi apparatus. In connection with the electrification scheme of the Bombay, Baroda and Central Indian Railway, Messrs. Petters, Ltd., have received orders for their direct-coupled electrical generating plants, comprising Petter "S" type oil engines and generators of Laurence Scott & Co.'s manufacture. This firm reports also successful developments in connection with its business in electric lighting plants and oil engines in Venezuela. There has been a considerable expansion in mechanical coal mining in Czecho-Slovakia in recent years. Competition between makers to supply coal-cutting machinery has been keen. British, German and American coal-cutters are in use, yet 40 per cent. of all the machines at work were manufactured by one British firm, Messrs. Mavor & Coulson, Ltd. This firm has also manufactured and supplied 66 per cent. of the coal-cutters at present in use in Belgium, where six other makers are represented. An important contract has been placed with Messrs. Ruston & Hornsby, Ltd., by the Ashford Urban District Council for the supply of three vertical cold-starting oil engines of 600 b.h.p. each. These are required for the new electricity scheme which has been sanctioned by the Electricity Commissioners.

A Manufacturer on National Electricity Supply.—Mr. George S. Francis, of the British Electrical and Allied Manufacturers' Association, addressed a meeting of the Birmingham and District Council of the National Industrial Alliance on February 17th, on "The National Development of our Power Resources." He said that, courageously planned and greatly conceived, electrical energy could provide us with a power more abundant and cheaper than any other. Electrically we were a backward nation, but we possessed the essential resources for leadership if we could evoke the will to employ them. We had lagged in developing electric power for industrial purposes, and supply for domestic purposes was still under-explored and under-developed. The primary condition of realising the vision of the electrical engineer was a broadly-conceived and nationally concerted plan, backed by a well-informed public opinion. The first step towards its realisation was legislative standardisation of frequencies and voltages.

Canton Harbour Improvements.—The *Chinese Economic Bulletin* reports that a scheme for the improvement of the Whampoa harbour, Canton, which has been under consideration for a considerable time, is to be proceeded with. It provides for the erection of quays and warehouses; the building of a light railway 2½ miles long; the purchase of dredging apparatus; and the construction of an electric light and power plant. It is stated that the last item appears in the second part of the scheme, which is to be carried out when funds are available.

The Philadelphia Exhibition.—The Sesquicentennial International Exposition which is to be held at Philadelphia, U.S.A., from June to December this year, is to include a British section with an area of 45,000 sq. ft., and a net exhibiting space of 26,000 sq. ft. A pamphlet which we have received from the secretary of the British Section, 24, Buckingham Street, W.C.2, contains particulars of arrangements and charges, and includes a form of application for space.

Registered Contractors: The Latest Additions.—The following is a list of applications accepted by the Executive Committee of the National Register of Electrical Installation Contractors on February 12th. At the same meeting five applications were declined and two were withdrawn:—

Harrison, Norman & Co., Preston.
Palfree, C. E., Southport.
Westoe Electrical Co., South Shields.
Gordon, Alexander, Houghton-le-Spring.
Schofield, J. L., St. Annes-on-Sea.
Brantingham Bros., Sunderland.
Watson, William, & Co., Sunderland.
Lankester & Son, Ltd., Southampton.
Marler & Co., Ltd., Newport, Mon.
Dixon, S., & Son, Ltd., Leeds.
Hall, John F., Burton-on-Trent.
Wilson, Albert V., Oadby, Leicester.
White, Alfred, Sunderland.
Jones, F. J., & Sons, Ltd., Chester.
Russell, Joseph W., Watford.
Thompson, John, Hetton-le-Hole.
Wilkinson, Bentley & Co., Ltd., Sheffield.
Henderson & Lawson, Paddington, W.2.
Cooke, George, & Co., Wilmslow, near Manchester.
Assersohn, D., London, E.C.4.
Gilkins, A. V., & Co., Ltd., London, S.W.1.
Higgs & Hill, Ltd., London, S.W.8.
Lee, Beesley & Co., Coventry.
Gompertz, G., South Shields.
Bennett, V. H., & Co., Weymouth.
Davies, G., & Co., Llandrindod Wells.
Malcolm & Allan, Ltd., London, W.C.2.
Jacobs & Drane, Ltd., Cheltenham.

Social Events.—The members of Messrs. LUNDBERG'S Social and Athletic Club held a very successful dance at the Islington Public Library on February 11th. All departments were well represented, nearly 200 members and friends being present, including Mr. G. C. Lundberg.

The second annual dinner of the staff of the St. Helens Corporation electricity undertaking was held on February 11th. Mr. F. N. Rendell Baker, borough electrical engineer, presided, and the guests included the Mayor and the chairman of the Electricity Committee. Mr. Rendell Baker referred to the splendid team spirit of the staff, which was an important factor in low production costs. Reference was also made to the development of the undertaking during the past few years. A musical entertainment was provided by Messrs. Lowe, Cockeram, Dingsdale, Garside, and others.

The annual dinner of the telegraph staff of the Great Western Railway was held at the Hotel Cecil on February 13th, and members of the staff attended from all over the system. Mr. E. J. Collier presided and was supported by Mr. E. C. Simpkins, general assistant to the superintendent of the line, Mr. A. D. Aikman, assistant to the chief accountant, and Mr. F. C. Warren, of the chief engineer's department. The loyal toast was proposed by the chairman and that of the Great Western Company by Mr. G. T. Milford, and responded to by Mr. E. C. Simpkins; "The Visitors," by Mr. H. Weaver, and responded to by Mr. Aikman and Mr. Warren. The toast of the chairman was proposed by Mr. Clarke (Birmingham). A musical programme was provided, mainly by members of the telegraph staff.

Revision of Brazilian Duties.—The *Board of Trade Journal* dated February 18th, contains a schedule of revised "consumption duties" embodied in the Brazilian Budget Law for 1926. These duties are to be imposed on many classes of goods formerly exempt, including electrical appliances. The following items are embodied in the list:—Electric lamps, batteries and apparatus; electricity; fans of any kind; and fires and stoves using wood, coke, gas or electricity as fuel.

Trade Announcements.—The Anglo Electric Co., Ltd., announces that "in order to express more accurately the present operations" of the company, it has decided to change its name and will henceforth be known as: Armorduct Cable Co., Ltd. (and reduced).

Mr. W. C. Pincott has resigned his post as chief engineer of the Criterion Restaurant, Piccadilly, and has commenced business in partnership with Mr. A. Taroni, at 23, Denmark Street, Charing Cross Road, W.C.2, as electrical contractors. He wishes to receive catalogues and lists.

Mr. J. H. Stephens, the receiver and manager of H. W. Smith & Co. (1920), Ltd., electrical wire and cable manufacturers, Lydbrook, Glos., states that he has disposed of the undertaking and business to Lydbrook Cables, Ltd. The business will be continued on the same lines at that address.

Mr. Goundry, electrical contractor, of Reigate, has removed his business to larger premises at 34, High Street.

Messrs. John Spencer, Ltd. (Wednesbury), have opened London offices at 176-178, Upper Thames Street, E.C.4, under the management of Mr. P. Spencer. The offices will deal with inquiries and orders for all classes of pipework.

Catalogues and Lists.—Messrs. Stewart Thomson and Patrick, Ltd., 10 and 12, Hart Street, London Road, Liverpool.—A stock list of d.c. and a.c. motors, small lighting sets, starters, &c.

Messrs. Ransomes & Rapier, Ltd., 32, Victoria Street, S.W.1.—An illustrated catalogue describing the company's petrol-electric mobile crane.

Messrs. W. J. Furse & Co., Ltd., Traffic Street, Nottingham.—A series of illustrated pamphlets describing the firm's services to the kinema and theatre industry. They include particulars of lighting dimmers, curtain controls, &c.

Messrs. Young, Osmond & Young, Ltd., Stafford House, Norfolk Street, Strand, W.C.2.—Two illustrated booklets dealing with the "Lightfoot" tubular heating system and its applications

Messrs. Bruce Peebles & Co., Ltd., Edinburgh.—Pamphlet No. 16D, illustrating and describing "Peebles" polyphase induction motors of medium size (0.75 to 470 h.p.).

The G.W.M. Electrical Co., Ltd., 43, Grafton Street, Tottenham Court Road, W.1.—An illustrated pamphlet advertising battery-charging sets for use upon a.c. and d.c. circuits. Priced.

Newalls Insulation Co., Ltd., 4, Mosley Street, Newcastle-on-Tyne.—Pamphlets advertising the company's magnesia insulation for steam pipes, refrigerator installations, &c.

Messrs. Baxter & Caunter, Ltd., 219, Tottenham Court Road, W.1.—A list containing particulars and prices of a.c. motors and starters.

Messrs. Marelli & Co., Ltd., 19 and 20, Garlick Hill, Queen Victoria Street, E.C.4.—List No. L/126, illustrating and describing the company's fractional h.p. motors.

Messrs. J. Hopkinson & Co., Ltd., Britannia Works, Huddersfield.—A folder illustrating a large group of high-pressure steam valves which the company has recently supplied to a leading American power station.

Engineering & Lighting Equipment Co., Ltd., Sphere Works, St. Albans, Herts.—Three illustrated folders dealing respectively with "Lunax" lighting units, "S.L.R." standard industrial reflectors, and "Interzone" shop-window reflectors.

Messrs. S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.C.—A blotter advertising the "Adnil" press button switch; and List L.A. 2/26, an abridged price list of electrical supplies.

The British Resistor Co., Ltd., 32, Clare Road, Halifax.—A booklet dealing with the "Globar" heating element and its applications.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—A leaflet advertising the company's "Elasta" electric lamps.

Messrs. Royles, Ltd., Irlam, near Manchester.—An illustrated brochure dealing with "Milletherm" feed water heaters.

The Igranic Electric Co., Ltd., 149, Queen Victoria Street, E.C.4.—Publication No. 6,213, containing full details, illustrations and prices of "Igranic" and "Igranic-Pacent" radio apparatus.

The Cambridge Instrument Co., Ltd., 45, Grosvenor Place, S.W.1.—A mailing card advertising six booklets which the company has published dealing with its instruments.

M. Paul Dieny, 21, Laurence Pountney Lane, E.C.4.—A price list of brown and black bakelite sheet.

Bankruptcy Proceedings.—F. J. Tizzard and N. Tizzard (Tizzard Bros.), electrical engineers and contractors, 27, Dalkeith Street, Barrow-in-Furness, and 21, Market Street, Dalton-in-Furness.—Last day for proofs for dividend, March 6th. Trustee, Mr. W. G. Pearson, Official Receiver, 16, Cornwallis Street, Barrow-in-Furness.

G. W. Ridley, electrical engineer and contractor, 1, Alfred's Court, Chorley.—Last day for proofs for dividend, March 5th. Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Street, Preston.

R. Wright (R. Wright & Co.), electrical engineer, 34-36, Oxford Street, W.—Trustee, Mr. R. F. W. Fincham, 3, Warwick Court, Grays Inn, W.C., released February 2nd.

W. T. Ellis and C. A. Hornsby (Ellis & Hornsby), electrical engineers, Gwynfryn, Deganwy Avenue, Llandudno. Trustee, Mr. I. D. Hooson, Official Receiver, St. Peter's Churchyard, The Cross, Chester, released February 8th.

A. Smith (Smith & Gill), electrician, 57, Albion Street, Nelson.—Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Square, Preston, released February 5th.

J. A. Bosher, electrical engineer and contractor, 33, High Street, Aberdare.—Last day for proofs for dividend, March 2nd. Trustee, Mr. S. E. Clutterbuck, 31, Queen Street, Cardiff.

G. V. Cooke (Wakefield Welding Co. and the Albion Accumulator Service), oxy-acetylene welder and accumulator charger.—Receiving order made February 13th, on debtor's own petition. First meeting March 1st, at the Official Receiver's Office, 21, King Street, Wakefield. Public examination, March 11th, at the Court House, Wakefield.

H. W. W. Alford, wireless engineer, 13, Goldsmith Street, and 261, High Street, Exeter.—Trustee, Mr. W. R. Cocks, Official Receiver, Exeter Bank Chambers, 67, High Street, Exeter, released February 4th.

J. Burkett, electrical engineer, 185, John Clay Street, and 78, Anderson Street, South Shields.—Trustee, Mr. C. Woollett, Official Receiver, Pearl Buildings, 4, Northumberland Street, Newcastle-on-Tyne, released February 5th, 1926.

E. Downing, lately carrying on business in co-partnership with E. J. Mills, as manufacturers of electrical conduit fittings, late of 143, Butts Road, Walsall.—Trustee, Mr. S. W. Page, Official Receiver, 30, Lichfield Street, Wolverhampton, released February 9th.

W. T. Smith, electrical and mechanical engineer, Victoria Street, and 61, Hampden Street, Bolton.—Last day for proofs for dividend, March 3rd. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

Company Liquidations.—Pressland Electric Supplies, Ltd., wholesale electrical and radio factors, Eden Street, Kingston-on-Thames.—A meeting of creditors was held recently at Kingston-on-Thames. The chair was occupied by Mr. W. Bronson, I.A., of 157, Cricklade Avenue, S.W., who had been appointed to act as the liquidator in the voluntary liquidation of the company. An approximate statement of affairs as at December 31st last disclosed ranking liabilities of £10,729 and assets estimated to realise £13,556. From that amount had to be deducted £8,800 due on debentures, leaving net assets of £4,756, or a deficiency as regarded the creditors of £5,973. The company had made advances to another radio company to the extent of £2,134, but at the moment it was not known what amount would be recovered. Mr. Bronson reported that the company was registered on December 6th, 1922, with a nominal capital of £1,100, all of which had been issued for cash. The directors of the company were Messrs. C. Pressland and H. W. Matton, who were also the only shareholders. The company traded successfully up to June, 1924, when it was in need of further capital. Up to that date Mr. Matton had advanced cash to the extent of £3,500, and he then lent a further £2,500, and as security was given debentures over the assets for £6,000. In January the interest on the debentures was in arrears, and Mr. F. W. Stevens was appointed as receiver. It appeared that the company had made advances to another wireless concern, and had received a debenture for £2,800. Between January 1st, 1923, and December 31st last, the total sales of the company amounted to £75,000, but Mr. Bronson said he was of the opinion that the gross profits earned during the period had been exceeded by the overhead expenses, and that there had been a net loss on the trading. In the course of a discussion it was pointed out that debentures had been issued for more than the amount of the company's capital, and it might be that some portion of the debentures could not be regarded as constituting a first charge over the assets. A resolution was proposed in favour of the voluntary liquidation of the company being continued, with Mr. Bronson as liquidator. Mr. Bronson stated that on the proxies lodged his appointment as liquidator was confirmed. A suggestion was made by one creditor that the meeting should be adjourned with a view to a compulsory petition being presented, but this was not agreed to.

Radio Equipment Co., Ltd.—A petition for the winding up of this company has been presented to the High Court by Marconi's Wireless Telegraph Co., Ltd., of Marconi House, Strand, W.C. Creditors will be heard in London on March 2nd.

Radio Works, Ltd.—Winding up voluntarily. Liquidator, Mr. R. L. Tayler, Coventry House, South Place, E.C.2. A meeting of creditors was called for February 25th at the Liquidator's offices.

Erith Electrical Co., Ltd.—Winding up voluntarily. Liquidator, Mr. H. C. Merrit, 41, Finsbury Square, E.C. Meeting of creditors, March 1st, at the Institute of Chartered Accountants, Moorgate Place, E.C. Particulars of claims to the Liquidator by April 1st.

Dissolutions of Partnership.—A. G. Bullen & Co., electricians, 79, West Walls, Carlisle.—Messrs. A. G. Bullen and R. L. Jenkinson have dissolved partnership. Debts will be attended to by Mr. Bullen, who will continue the business under the same style.

Taylor & Anderson, electricians, Talbot Street, Grangemouth.—Messrs. R. Taylor and R. Anderson have dissolved partnership. Mr. Anderson will continue the business.

Deed of Assignment.—W. W. Symper and D. J. Evershed (Symper & Evershed), electrical engineers, 22-24, Greenhill Parade, Harrow-on-the-Hill. Particulars of claims to the Trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C.2, by March 9th.

Meeting of Creditors.—COLE, MARCHENT & MORLEY, LTD.—A meeting of creditors was held at the offices of the company on February 16th. Mr. A. Greaves, the company's accountant, presented a statement of affairs, which showed liabilities to unsecured creditors of £54,522, along with contingent liabilities of £20,000, and second debentures for £71,000. The assets covered by the first debentures, land, buildings, motive power, &c., were taken at book value, *viz.*, £72,396, leaving a surplus of £57,278. The balance of assets after deducting the second debentures showed a surplus of £55,801, less the amount due to unsecured creditors £54,522, leaving a surplus of £1,279. Mr. Greaves emphasised the fact that the assets taken at book value had recently been valued at a much larger sum on the basis of a going concern, but that the realisable value was problematical, depending entirely upon the mode of realisation. After discussion, the creditors passed a resolution leaving the matter in the hands of the receivers (Messrs. A. Greaves and R. S. Brailsford), and appointed a committee to whom the receivers will report from time to time. The opinion was expressed that it was not advisable in the interest of the creditors for any steps to be taken by any creditor to place the company in liquidation.

Railway Electricians' Dispute Settled.—The threatened strike of electricians employed in the power and sub-stations of the London electric railways has been averted by the concession by the companies of the 6½ per cent. increase which was recently awarded to all electricity supply workers in the London area.

Local Exhibition. — BURNLEY. — The recent exhibition organised by the Electricity Committee produced satisfactory results. It was visited by 21,206 persons, and £108 was received in admission fees. The appliances disposed of were: Cookers, 52; radiators, 56; vacuum cleaners, 21; "Santon" geysers, 12; wash boilers, 10; sewing machines, 8; sundry appliances (irons, kettles, bed-warmers, &c.), 60.

Catalogues Wanted.—MR. T. H. M. SWINBURNE, electrical engineer and merchant, Ellesmere Road, Altrincham, asks for catalogues and price lists of electrical goods of all kinds, with wholesalers' terms.

Wireless Exhibition, Olympia, 1926.—We learn that the Wireless Exhibition to be promoted by the N.A.R.M.A.T. will be held in the new Hall, Olympia, from September 4th to 18th next (both inclusive), and that it will be thrown open to the trade as a whole. It is hoped that such support will be afforded the forthcoming Exhibition as will make it fully representative of the British radio industry.

Contract Conditions.—With reference to the I.E.E. Model Form of General Conditions "A" (Home-With Erection), we learn that Clause 37 (Regulations of Local Authorities) of the edition (revised September, 1921) has been amended by the Council to make it clear that the regulations and by-laws with which the contractor shall conform are those which the local or other authorities are authorised by Statute to make. In Clause 37 of the new edition (revised January, 1926) the words "which they are authorised by Statute to make and" have been inserted after the word "authorities." The new edition in all other respects conforms with the old edition.

A Telephone Directory.—MR. J. C. WHITE (Manchester) has sent his customers a useful desk telephone directory with ample space for memoranda.

Steam Turbines for South America.—The Compania Hispano-Americana de Electricidad has contracted with the International General Electric Company for two 52,500-kW, tandem-compound steam turbine generators as the initial installation for the new generating station to be built at the entrance of the harbour of Buenos Aires. Each generator will be a 50,000-kW, 13,200-V, 1,500-r.p.m. main unit with a 250-V d.c. exciter and a 2,500-kW, 2,300-V service generator with its own d.c. exciter, all mounted on the same shaft. The turbines will operate at an initial steam pressure of 550 lb. gauge and 750 deg. F. total temperature, with full intermediate reheat of the steam between the cylinders.

Swedish Refrigerating Apparatus Development.—According to the papers, the Aktiebolaget Elektrolux has received a communication from America stating that a definite agreement has been concluded with a leading American manufacturer of refrigerating apparatus regarding the exploitation of the remarkable Swedish invention in this branch made by the two young engineers, Messrs. Platen and Munters. Aktiebolaget Elektrolux will receive a sufficient number of shares in the American exploiting company to assure its control over the company, together with a sum in cash and a royalty on production. Companies affiliated to Elektrolux have been founded in Germany and France in order to create markets for the new invention and other products of the company. Factories will be erected or leased in Berlin and Paris for the manufacture of cupboards for refrigerating apparatus, while these will be produced to the largest possible extent in Sweden.—*Reuter's Trade Service* (Stockholm).

The "Electrolux" refrigerator is described elsewhere in this issue. A factory is to be built at Luton for its manufacture.

For Sale.—Newquay Electric Light and Power Co., Ltd., invites offers for two Belliss & Morcom compound non-condensing engines, direct-coupled to two 500-volt d.c. generators, two Stirling boilers with superheaters, and two Weir feed pumps, valves, piping, &c. The Royal Kinema, Tonypandy, has for disposal one 18-h.p. motor generator set. The Palace Pier Co., Brighton, invites offers for two Otis electric passenger lifts. By order of the High Court, Messrs. H. Butcher and Co. invite offers for the nautical and scientific instrument works of Heath & Co., Ltd., Avery Hill Road, New Eltham, comprising freehold land, buildings, plant, machinery, stock-in-trade, &c. (See our advertisement pages to-day.)

Book Notices.—"Weaving and Woven Fabrics." Pp. 710; illustrated. London: Lewenz & Wilkinson, Ltd. Price 41s.—This is Vol. XVI of the Schlomann-Oldenbourg illustrated technical dictionaries, and covers that section of the textile industry which is of chief interest to electrical engineers—namely, the applications of electricity to driving the machinery, and the motors and accessories employed. It is true that the electrical references form but a small part of this volume, which covers a vast number of technical terms and forms a very useful and worthy addition to a series of dictionaries that is without a rival. The book is of a more convenient shape than the earlier volumes, and the six languages covered are provided with separate indexes, instead of being run together alphabetically. We cannot speak too highly of the Schlomann dictionaries, which are indispensable to those who have occasion to translate technical articles and data.

The following pamphlets have been published by the Technical Section of the Association of Engineering and Shipbuilding Draughtsmen, 96, St. George's Square, London, S.W.1, during the present session 1925-26:—"Rolling-Mill Machinery," by R. C. D. Fell; "Foundations," by W. H. Latham; "Perspective Drawing for Draughtsmen," by W. Sellar. Many examples of electrically-driven machines are cited in the publication by Mr. Fell. The price of each publication to the public is 2s.

"Who's Who in Architecture," for 1926. London: The Architectural Press. Price, 25s. net.—The publication of this year's edition has been expressly timed to coincide with the recently concluded amalgamation of the Society of Architects and the Royal Institute of British Architects, and the new volume includes the numerous qualification changes which this most important event has brought in its train. The new issue has been carefully revised, and its biographical notices of the British architects have been compiled with the greatest care under the editorship of Mr. Fredk. Chatterton, F.R.I.B.A.

"Theory and Practice of Alternating Currents," by A. T. Dover. Pp. xv+539; 303 figs. London: Sir Isaac Pitman and Sons, Ltd. Price 18s. net.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIV, February, 1926, No. 350. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

New French Company.—La Société d'Electrification Rurale de Lesuere-Jaoul is the name of a new concern which has lately been formed at Rodez with a capital of 664,700 fr., to establish a hydro-electric station upon Jaoul falls.

A German Merger.—It is reported from Stuttgart that the business of the Eisemann Gesellschaft has been amalgamated with that of the Robert Bosch Gesellschaft of that town. Both concerns are well known as manufacturers of magnetos, sparking plugs and other electrical equipment for motor vehicles.

Swedish Agreements with Russia.—Besides the agreements entered into between the A.E.G. and the Soviet State Electrical Trust (heavy electrical engineering branches), to which reference was recently made, it is now announced that in the matter of light electrical engineering manufactures, a licence and sales agreement has also been concluded for a period of six years between the Swedish Ericsson Company and the Soviet Low Pressure Trust. The latter is said to have been granted the exclusive right of using all the patents of the Swedish company also in Esthonia, Latvia, Lithuania, Persia, Afghanistan and Mongolia. Moreover, the sole right of sales for all the products of the Swedish company is reported to have been granted for the countries in question with the exception of Esthonia, Latvia and Lithuania, and a credit of 3,000,000 kr. with the Swedish company in the case of possible orders given by the Trust. In return, the Swedish company will receive a payment of from 2 to 4 per cent. of the value of all installations carried out by the Trust on the basis of the agreement.

New Italian Companies.—Among the new electricity supply undertakings recently organised in Italy are the Società Idro-Elettrica Sile, of Treviso, capital 100,000 lire, and the Società di Elettricità, of Genoa, capital one million lire.

Irish Free State Electrical Imports.—The imports of electrical goods into the Irish Free State during November last attained a value of £48,166, as compared with £35,434 in the corresponding period of 1924. For the first eleven months of 1925 the returns show a total of £356,181, as against £364,703. It should be noted that the imports of electrical machinery are not included in the above figures.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report February 23rd:—No change in the prices of electrolytic copper.

Messrs. James & Shakespeare report February 23rd:—Copper bars (best selected) sheet and rod, no change; English pig lead, £35 5s., 5s. decrease.

Messrs. Edward Till & Co. report February 23rd:—India-rubber, Para, fine, 2s. 3d., 4d. decrease.

Tramway Extensions in Argentina.—It is reported that the Rosario Municipality is contemplating the extension of its tramway system into outlying districts. The cost is estimated at 2,500,000 pesos (approximately £59,000).

Large Machinery Production in Czecho-Slovakia. — The Skoda Works Co., of Pilsen, has recently completed a 20,000-h.p. steam turbine and dynamo, designed to run at 3,000 r.p.m., for the municipal power station in Prague.

Lighting Propaganda in France.—With the object of encouraging the improvement of lighting throughout France, a number of electricity supply undertakings and makers of electric lamps and other fittings in that country have recently organised the Société pour le Perfectionnement de l'Eclairage, with headquarters at 12, Rue Pelleport, Paris. The new organisation has for its object the collection, co-ordination and broadcasting of information relative to lighting, to train-lighting specialists; to inaugurate a campaign in favour of better lighting; to explain and demonstrate by conferences, leaflets and tests the principles on which modern lighting installations should be based, &c. It is proposed to establish a showroom for modern electric lighting equipment and to establish a journal with the title *Eclairagisme* to deal specially with lighting matters.

Lighting and Power Notes.

Aire and Calder Electricity District.—The conference of local authorities of the West Riding of Yorkshire (Aire and Calder) Electricity District held a meeting on February 17th, at the Bradford town hall, when there were present representatives from Bradford, Halifax, Dewsbury, Huddersfield, Barnsley, Wakefield, Keighley, Batley, Shipley, Ilkley and Hebden Bridge. The present position in relation to the long-deferred proposed Aire and Calder scheme, and the position in regard to supply demands, or proposals in various West Yorkshire districts, were discussed. The conference was again adjourned, to a date to be fixed by the executive committee, and no statement of the proceedings was issued for publication.

Australia.—Sydney (N.S.W.).—According to the *Australasian Electrical Times*, in order to provide for the increase in the demand for electricity for about ten years, approval has been given by the City Council to the laying of underground h.p. cables at a cost of £1,542,000 to replace the existing h.p. overhead mains. The amount is to be expended during the next four years, in the following proportions:—1926, £376,000; 1927, £293,000; 1928, £479,000; 1929, £394,000.

New South Wales.—*Tenders* states that included in the State treasurer's estimates for the forthcoming year are the following items:—Hydro-electric schemes, £85,500; Burrinjuck dam development works, £208,700.

Barnsley.—Loan.—The Town Council is applying for sanction to a loan of £42,000 for the laying of mains and other purposes.

Blackpool.—Electricity Agreement.—The draft agreement with the Corporation for the supply of electricity to Poulton, Carleton and Marton has been revised and the amended document has been forwarded to the Corporation for ratification.

Blyth.—New Power Station.—The Northern Counties Electricity Supply Co., Ltd., is to erect a power station at Newsham, Blyth.

Canada.—Hydro-Electric Development.—Development of the Alexander Falls on the Nipigon River, at an estimated cost of nearly $7,000,000, is to be carried out by the Ontario Hydro-Electric Power Commission, authority for the development having been granted. This development, which has been made necessary through increased demands for power from the industrial interests in the Thunder Bay district, will add 50,000 h.p. to the present supply of 65,000 h.p. available at Cameron Falls, one and a-half miles north of Alexander, and will enable the Government to take ample care of the situation at the head of the lakes until 1930 or 1931. Operation at the new power site will begin in 1928. Its complete power capacity, according to the Premier, has been applied for already. Ontario's investment on the Nipigon represents $12,000,000, which is approximately $1,000,000 less than the amount which was estimated by the Hydro-Electric Commission as required.

Continental.—France.—The French Ministry of Public Works has recently granted a concession to the Société d'Energie Electrique de l'Emblavez of Lavoute-sur-Loire, to establish a hydro-electric station to utilise the water power of the River Loire in the Department of Haute Loire.

The report of the Société Electrique du Nord-Ouest for the past year shows a steady increase in the use of electricity for lighting and power purposes in North-West France, the sales of the company having increased from 80,629,347 kWh in 1924 to 88,283,010 kWh last year. During the year a 90,000-V transmission line was erected between Bully and Gosnay and between Bully and Dainville for the supply of electricity to the Arras district.

Luxembourg.—Plans have been prepared for the construction of two large hydro-electric stations to utilise the water power of the River Our, one at Holzentry and the other near Vinden.

Spain.—The Sociedad de Canalazacion y Fuerzas de Guadalquivir has recently commenced the construction of another dam below the Jandula falls which will supply water to a new hydro-electric station with a capacity of 26,000 h.p.

Cottingham.—Electricity in Bulk.—The Urban District Council has received an offer of a bulk supply of electricity from Hull Corporation, and has appointed a deputation to meet the Corporation with a view to obtaining further information as to the estimated cost.

Cumnock.—Electricity Supply.—The Town Council has accepted the offer of the Ayrshire Electricity Board for an electricity supply and is to allow overhead cables to be installed.

Dartford.—Loan.—The Electricity Committee has recommended to the Urban District Council that application be made for sanction to a loan of £33,480 for electricity extensions.

Edinburgh.—Street Lighting.—The Corporation Lighting Committee has recommended that provision be made for improved street lighting. The scheme includes the provision of 800 new electric lamps, while a number of the old lamps are to be fitted with Holophane glassware. The wattage of lamps in side streets in various districts is to be increased.

Epping.—Electricity Supply.—The Urban District Council has consented to the application of the North Metropolitan Electric Power Supply Co. for a Special Order to supply electricity in the district. No overhead wires are to be erected in the town, and the maximum charges are to be 10d. per kWh for lighting and 1½d. per kWh for heating.

Glasgow.—Progress during January.—The manager of the Corporation electricity undertaking reports that 104 houses were wired in January, making the total to date 1813, and that the number of applications for the hire of domestic appliances was 216, making the total to date 9,819.

Heywood.—New Plant.—The Town Council is to install a 750-kW rotary converter at the power station, and application is being made for sanction to a loan of £4,600 to cover the cost of the plant.

Holmfirth.—Extension of Supply.—The Urban District Council has approved a scheme for electricity extensions, and application is being made for sanction to borrow £5,000.

Hornsey.—Loans.—The Electricity Committee has recommended that application be made for sanction to loans of £1,000 for extensions and £9,000 for services.

Ipswich.—Electricity Extensions.—The Town Council has adopted a report submitted by the Electric Supply and Transport Committee on electricity extensions. Two 2,000-kW rotary converters are to be installed at an estimated cost of £16,000, and additional d.c. feeders are to be laid from the power station to Stoke Bridge, Major's Corner, and Barrack Corner at a cost of £15,700.

Irish Free State.—Ballina (Co. Mayo).—A scheme for supplying electricity for public and private lighting in the town is about to be undertaken by Mr. T. J. Reid, of the Gas Works, Ballina, who has applied to the Ministry of Industry and Commerce for a Special Order to enable him to carry the proposed scheme into effect.

Howth (Co. Dublin).—The Urban District Council proposes to have the electric lighting system extended and to introduce facilities for domestic lighting.

Kent.—Electricity Scheme.—The *Evening News* states that Messrs. Pearson & Dorman Long, Ltd., are to spend £2,000,000 on the development of the Kentish coalfield, and it is reported that plans have been prepared for the generation of electricity and for its transmission to London.

Leominster.—Electricity in Bulk.—The Electricity Commissioners have approved the supplementary agreement of the Hereford Corporation for a supply of electricity in bulk to the Leominster Electric Supply Co., Ltd.

Lichfield.—Loan Sanctioned.—The Town Council has received sanction to a loan of £28,700 in connection with the electricity scheme.

London.—Bermondsey.—The Electricity Committee has received sanction to the borrowing of £21,500 for mains, meters, and domestic apparatus.

Maidstone.—Extension of Supply.—The Corporation is to extend its cables from the Snodland Paper Mills to a new cement factory at Holborough. It is stated that this will mean an additional supply of electricity from Maidstone of about 6,000,000 kWh per annum.

Mansfield.—New Sub-Station.—The Town Council has received an application for a supply of electricity to a factory in course of erection in Sutton Road, and is to provide a sub-station at a cost of £1,000 for the supply of electricity in that district.

Nottingham.—Electricity Charges.—The Electricity Committee has agreed to place arc projectors and generators in kinemas on the power rate of 2¼d. per kWh, instead of the present rate of 5½d. per kWh.

Padiham.—Electricity Supply.—The Lancashire Electric Power Co. has erected overhead cables from Accrington electricity works to the new power station at Padiham, and is now taking electricity from Accrington to supply certain areas in Padiham district, pending the completion of the new Padiham station. Electricity is transmitted at 10,000 V.

Preesal.—Loan.—Application is being made by the Urban District Council for sanction to a loan of £1,000 for the purchase of domestic apparatus to be let out on hire.

Preston.—LOAN.—The Electricity Committee has recommended that application be made for sanction to the borrowing of £10,000 for the purchase of cookers, &c., to be let out on hire.

Portsmouth.—ELECTRICITY CHARGES.—The Electric Lighting Committee has revised the scale of charges for lighting as follows:—Within the borough: First 5,000 kWh per annum, 5½d. per kWh; from 5,000 to 10,000 kWh, 5d.; 10,000 to 20,000 kWh, 4d.; 20,000 to 30,000 kWh, 3½d.; 30,000 to 40,000 kWh, 3d.; 40,000 to 50,000 kWh, 2d.; any quantity above 50,000 kWh per annum, 1½d. per kWh. Outside the borough, 2d. per kWh extra in each case.

Rothesay.—NEW POWER STATION.—The Town Council proposes to erect its own power station for the supply of electricity in the town. Electricity is at present obtained from the Rothesay Tramway Co., Ltd.

Rugeley.—ELECTRICITY SUPPLY.—It has been reported to the Urban District Council that Major Prescott-Westcar has decided not to proceed further with his application for a Special Order, but that the Power Development Co., of London, is considering the question of making an application in association with Messrs. Rooper & Chalmers. The Council has decided to ask the Power Development Co. for particulars of its scheme.

Sittingbourne.—ELECTRICITY SUPPLY.—The Urban District Council has been informed by the Kent Electric Power Co. of its inability to supply electricity to the town at present. Messrs. E. Lloyd, Ltd., who had also been approached on the matter, have replied that they cannot give a supply, and the Sheerness Electric Power Co. has now been approached with a view to obtaining a supply from its works.

South-East Lancashire.—ELECTRICITY ADVISORY BOARD.—The Board has intimated to Alderley Edge Urban District Council that it is considering supplying electricity in bulk through the Alderley and Wilmslow Electricity Supply Co., and also the attitude to adopt in any action initiated by local authorities with the object of securing a reduction in the charge of 10d. per kWh at present made by the company.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Richmond (Yorks.) Town Council to supply electricity in the borough and rural district of Richmond.

Application has been made by Mr. R. F. Winder for a Special Order to supply electricity in Boroughbridge (Yorks.) and district.

The Minister of Transport has confirmed Special Orders made by the Electricity Commissioners authorising the Birmingham Corporation to supply electricity in the rural district of Solihull and part of the rural district of Meriden, and the St. Helens Corporation to supply in part of the rural district of Whiston.

Stanhope (Co. Durham).—ELECTRICITY SCHEME.—In connection with the Urban District Council's scheme for the electrification of the whole of Weardale, the engineer has submitted a report based on obtaining a bulk supply from the Cleveland and Durham County Electric Power Co. at Peases West, Crook, and transmitting it at a pressure of 19,000 V to Wolsingham, from which centre it would be distributed to all parts of Weardale, a total distance of 21 miles. The preliminary estimates show the cost to be about £33,000.

Thornaby-on-Tees.—STREET LIGHTING.—The Corporation is of opinion that it might encourage private consumers to take a supply of electricity if the service were adopted for street lighting, and it was agreed to obtain from the Cleveland and Durham County Electric Power Co. an estimate of the cost of laying mains for lighting certain streets by electricity.

United States.—ELECTRICAL DEVELOPMENTS.—According to *Power*, the improvement and extension programme of the Columbus Railway Power & Light Co., Columbus, Ohio, involving an expenditure of $11,000,000, will be completed by the company this year. Some of this work has been in hand for two years. Other work expected to cost $3,000,000 will be started this year. The new Pickaway power plant, erected about 11 miles south of Columbus in Pickaway County, at a cost of $7,000,000, with provision for more than doubling its capacity at a total cost of over $16,000,000, is being erected. This plant will have a capacity of 60,000 kW when it is placed in service this year. Additional units will be installed as needed to bring its total capacity to 150,000 kW.

An application for a preliminary permit covering the Cove Creek site on Clinch and Powell rivers in the Tennessee Valley, has been filed with the Federal Power Commission by the Union Carbide Co., of Richmond, Va., a subsidiary of the Union Carbide & Carbon Co., of New York. The Company's plans call for a maximum development of this important site. It is proposed to build four dams and power houses. The installation proposed at the power houses is 30,000 h.p., 50,000 h.p., 13,000 h.p., and 200,000 h.p.

Whaley Bridge.—ELECTRICITY SCHEME.—The Urban Council has referred to the South-East Lancashire Electricity Advisory Board a letter from the Power Development Company, London, asking for the Council's support to an application for an Order to supply electricity in the rural district of Chapel-en-le-Frith and the urban district of Whaley Bridge.

Worsborough.—WIRING OF SMALL HOUSES.—The Urban District Council has received a report from the Electrical Distribution of Yorkshire, Ltd., on the wiring of 40 houses on the Back End site. The company states that the cost of connecting these houses with the sub-station would be £1,350, and it suggests levying a charge of £2 per house for the service connection. The charge through quarterly meters would be 6½d. per kWh and through slot meters, 7½d. per kWh.

Tramway and Railway Notes.

Bradford.—NEW TRAMCAR DESIGN.—The Tramways Committee has authorised Mr. R. H. Wilkinson (general manager) to proceed with the construction of a single-deck saloon tramcar, divided into smoking and non-smoking compartments, which will be entirely new to Bradford. The cost will be about £2,000, the seating capacity 40, and the speed capacity appreciably greater than that of the existing double-deck cars. The car, which is to Mr. Wilkinson's own design, will run on two four-wheel bogeys. The conductor will be in the middle of the saloon, at a central entrance, and there will be no screen between driver and passengers.

Continental.—SPAIN.—The Spanish Department of Communications has recently placed the contract for the supply of the electrical energy for the electrified railway between Ripoll and Aix-les-Thermes in the Pyrennees, with the Sociedad Energia Electrica de Catalune, of Barcelona.

FRANCE.—Contracts have been placed for the construction of two new sections of the Paris underground electric railways.

Good progress is being made with the electrification of the Culoz-Modane Section of the Paris, Lyons and Mediterranean railway. The transformer stations at Aix-les-Bains, Chambery, Saint Pierre-d'Albigny and Saint Jean de Maurienne have already been completed, and the erection of the 45,000-V line between Venihon and Chambery to feed these stations is well in hand. The third rail has been laid between Chambery and St. Pierre-d'Albigny, and electric locomotives are now running on the Chambery-Montmelian section, current being drawn from the Chambery transformer station which is being temporarily supplied from the Departmental electricity transmission system.

Greenock.—ELECTRICITY ACCOUNTS DISPUTE.—The *Greenock Telegraph* states that a difference of opinion has arisen between the Corporation and the Greenock and Port Glasgow Tramway Co. regarding the payment of electricity accounts. Under the arbiters' award the Corporation is satisfied that a minimum payment of £5,000 per annum was fixed, but this is disputed by the Company. The Electricity Committee has recommended that the Corporation should insist upon full payment of the amount specified in the award and for recovery of arrears.

London.—L.C.C. TRAMWAY IMPROVEMENTS.—Double-deck L.C.C. tramcars are to replace single-deck cars on the Chelsea Bridge to Lavender Hill route in a few weeks' time. The road is being lowered by 18 inches underneath the Southern Railway arches near Queen's Road station to allow the larger cars to pass.

TRAMCAR IMPROVEMENTS.—A tramway-car reconstructed with special consideration for the comfort of passengers has been put into service on the Enfield to Euston route of the Metropolitan Electric Tramways, Ltd. It has been fitted with the latest type of cross seating, well-sprung seats being arranged with reversible backs, so that passengers may always face the direction in which the car is proceeding. In place of the usual slatted floor, the lower saloon floor has been covered with rubber. Six cars are being reconstructed in a similar manner for service on various routes.

Madagascar.—RAILWAY ELECTRIFICATION.—A *Reuter* message from Paris states that the Governor-General of Madagascar intends to submit to the French Government an important programme for the further development of Madagascar, which includes the electrification of the Antananarivo-Tamatave railway and the construction of an electric railway linking up the densely-populated Betsileo district with the east coast.

Preston.—TRAMWAY IMPROVEMENTS.—The Tramways Committee has recommended permanent-way renewals at a cost of £4,900, and car renewals at a cost of £3,920.

Salford.—THROUGH-RUNNING.—The *Electric Railway and Tramway Journal* states that, following upon the establishment of the tramway service between Victoria Bridge and Bury, the Tramways Committee has had under consideration means of making further extensions to its services. The latest suggestion is that a service shall be run from Salford to Walkden. The present traffic in Walkden is under the control of the Lancashire United Tramway Co., and the Tramways Committee has decided to open negotiations with that company, the object in view being an interchange of services similar to that which now exists between Salford and Bury. At a later date the Committee hopes to proceed with the establishment of a similar service between Salford and Bolton.

Telegraph and Telephone Notes.

China.—Cable Rates Increased.—The Chinese Telegraph Administration at Harbin recently increased by 20 per cent. the cable charges on telegrams to foreign countries. Charges are payable in local paper dollars.

Czecho-Slovakia.—Long-distance Telephony.—The Ministry of Posts and Telegraphs has arrived at an agreement with the French and German telegraph authorities for the installation of a direct telephone service between Prague and Paris. The project is to be carried into effect this summer. The *Financial Times* thinks it probable that as soon as the service is inaugurated the charge for a three minutes' conversation will be reduced from 10 to 8.60 fr., as the expenses now involved by the use of the relaying station at Frankfurt will no longer be incurred.

Dominica.—Telephone System.—The Municipal Council of Santiago, Dominican Republic, has sanctioned a proposal for the establishment in Santiago of a modern telephone system for a minimum of 500 subscribers.—*Reuter's Trade Service* (Port-au-Prince).

France.—International Telegraph and Telephone Rates.—As from February 16th the standard international telegraph and telephone rates will be multiplied by 5.2, as compared with 5.1, the figure fixed on January 16th. The rate is still lower than that which came into force on January 6th, when a figure of 5.3 was established, as compared with 5 in December, 1925.—*Reuter* (Paris).

Honduras.—Telephone System.—The Government of Honduras has entered into a contract for the construction of a telephone line, 175 miles in length from the capital (Tegucigalpa) to San Pedro Sula, running along the eastern shore of Lake Yojoa, the contractors undertaking to have the service in working order before the middle of September. The same firm has been granted a concession to construct a line from Tegucigalpa to Yorro, with branches at Trujillo, Olanchito, La Ceiba, &c.—*Reuter's Trade Service* (Tegucigalpa).

Hull Telephone Service.—Relief of Rates.—Hull Corporation Telephone Committee has decided to give a sum of about £1,700, representing one-half per cent. of the undertaking's liquid loans, in the relief of the city rates. The chairman said it would be advisable, in view of the difficulty of estimating the year's developments in expenditure, for the undertaking to be abundantly safe. It might be, too, that at the end of the year the Government would take over the undertaking.

Iraq.—Telephone Service.—The telephone service in Iraq is still in its infancy. There are no long-distance lines, and the only cities having telephone systems are Baghdad, Mosul, and Basra. Baghdad, a city of 250,000 population, has about 400 subscribers, and the annual rate is 440 rupees (nearly £35). In Mosul, a city of about 60,000 people, the use of the telephone is limited almost entirely to the British military and Iraq Government Services. The Basra automatic system was installed by the British army of occupation, and gives ample facilities. The rates (now about 400 rupees) will probably be decreased shortly in order to attract subscribers.

Marine Radio Operators.—Strike Settled.—The marine wireless operators' strike was settled at the Ministry of Labour on February 18th, and work was to be resumed immediately. The strike began on November 26th last, when the men declared that the employers failed to consider certain questions raised by the men's association on which satisfaction was desired before negotiating with regard to a proposal by the shipowners to reduce wages by 22s. 6d. a month. The resumption of work was to take place on the new rates of pay, at the reduction of 22s. 6d. a month demanded by the employers. The whole of the matters in dispute, including wages, are to be the subject of negotiation after the resumption of work, and if no settlement is reached the questions in dispute are to be referred to arbitration.

Radio-Telegraph Convention.—New Members.—It is announced that the Côte Français des Somalis and the Republic of Honduras have become members of the Radio-Telegraph Convention.

Radio Notes.

Broadcasting Committee.—Report.—The Broadcasting Committee, appointed by the Government under the chairmanship of the Earl of Crawford, was to meet at the House of Commons this week to frame its recommendations. Its report is expected to be in the hands of the Postmaster-General early next month.

Czecho-Slovakia.—Growth of Broadcasting.—The *Gazette de Prague* says that the first radio missions in Czecho-Slovakia were made in 1923, when trials were carried out in the spring at Kbely with 1-kW transmitting plant. On June 7th of that year the Radiojournal Company was created, with a capital of 500,000 crowns, of which the Radioslavia concern subscribed 255,000 crowns. At first operations were difficult as the only broadcasting station available (at Kbely) was constructed for telegraphy, and certain alterations had to be made. The first six concessions for receiving stations were granted on October 10th, 1923; on December 31st of that year 47 licences had been issued, at the end of 1924 the number was 1,564, and at present there are 32,000 listeners in Czecho-Slovakia. Since the inauguration of the Strasnice broadcasting station the number of listeners has increased considerably, and it is thought that the figure of 50,000 will be exceeded at the beginning of March.—*Reuter's Trade Service* (Prague).

Paraguay.—New Station.—A radio-broadcasting station, erected under the auspices of the Military School at Asuncion, has been completed and a trial programme instituted.—*Reuter's Trade Service* (Asuncion).

United States.—G.E.C. Research.—There are now nine transmitters working on nine different wave-lengths from Schenectady, and during some periods seven may be "on the air" at the same time, not all broadcasting, however. Within three miles of the city the General Electric Co., of America, has constructed a transmitter development station; eight transmitters have been erected, each having its independent antenna system, which are constantly undergoing changes, and all transmitters are constructed on wooden frames so that they may be quickly dismantled as new methods are devised. The company is indebted to listeners who have reported on the various tests, notably the 50-kW broadcast tests and the programmes broadcast alternately from vertical and horizontal antennæ on superpower. Reports from volunteer listeners are supplemented by observations made by a corps of field engineers who are detailed to various parts of the country. Investigations at the South Schenectady station include short and long wave-lengths, code and broadcast signals, with various degrees of power input and a variety of antenna structures. Experimental broadcasting on special wave-lengths is finding increasing favour; Captain Calvin H. Burkhead, post signal officer, at Fort Leavenworth, Kansas, U.S.A., states that the 41.88-metre signals of WGY are received on a master receiver, and after amplification the signals are sent over 15 miles of wire to loud speakers in 162 homes. Development work on the 1,560-metre wave-length has shown that it is the "ideal" wave-length for reliable and consistent relay service over distances up to 300 miles.

Popularity of Radio.—A nation-wide survey of the radio industry made by Mr. Arthur Williams, vice-president of the New York Edison Co., shows that one of every three families in New York City and one of every five families in the rest of the United States owns a radio set. Radio sales have increased from 5,000,000 dollars to over 300,000,000 dollars in the last five years, and nearly 15,000,000 dollars were spent on broadcasting programmes last year. There are 22 broadcasting stations in the metropolitan area, and a total of 563 broadcasting stations throughout the United States.—*Reuter's Trade Service* (New York).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Sydney.—March 31st. New South Wales Government Railways. One air compressor for Zarra Street power house.

April 21st. Four motor-generator sets and four switch-operating batteries for Hornsby and St. Leonards sub-station. Specifications from Chief Electrical Engineer, 61, Hunter Street, Sydney.

Melbourne.—April 7th. City Electrical Department. One 2,000-kW rotary converter, with transformer and accessories,* d.c. switchgear and accessories, and one a.c. control panel.*

April 7th. Victorian Government Railways. One hydraulic plate-bending press.* April 21st. Eight electric overhead travelling cranes.*

Bedford.—March 3rd. Electricity Department. E.h.p., h.p., and l.p. underground cables for 12 months. (February 19th.)

Belgium.—March 9th. Municipal authorities of Ixelles, Brussels. 6,000-kW steam turbo-generator set. Particulars for 3 fr. from Hotel Communal.

March 2nd. L.p. armoured cables and d.c. electricity meters. Particulars for 3 fr. from Hotel Communal.

March 4th. Municipal authorities of Schaerbeek, Brussels. 250-kVA transformer. Particulars for 5 fr. from Bureau du Service de l'Electricité, Hotel Communal, Schaerbeek.

Birmingham.—March 6th. Tramways Committee. Traction motors, power wiring, &c., for 30 tramcars. Form of tender from Mr. A. Baker, general manager, Tramway Offices, Council House, Congreve Street.

Bridlington. — March 10th. Electricity Department. Stores for 12 months, including electrical sundries, lamps, cables, &c. (See this issue.)

Cardiff.—March 8th. Electricity Department. One 10,000-kW turbo-alternator and condensing plant. (February 5th.)

Dundee.—Town Council. Tramway rails, tie-bars, fish-plate bolts and nuts. Specifications, &c., from Mr. Geo. Baxter, city engineer.

East Ham.—March 15th. Electric Lighting and Tramways Department. Cable, bifurcating boxes, and joint boxes. (See this issue.)

Eccles.—March 6th. Health Committee. Installation of electric lighting, including wiring and fittings, for houses being erected in Anson Street, Monton. Form of tender from Borough Electrical Engineer, Electricity Works, Cawdor Street.

Edinburgh.—March 8th. Electricity Supply Department. One 25,000-kW turbo-alternator with condensing plant, or alternatively, one 20,000-kW turbo-alternator with condensing plant. (February 5th.)

March 9th. Tramways Department. 1,200 tons of steel tramway rails. Specifications, &c., from Tramway Manager, 2, St. James' Square.

Hull.—Corporation Electricity Committee. Automatic table telephones and bell sets. (February 19th.)

India.—March 30th. India Store Department. Complete equipment for one rotary-converter sub-station, three separate rotary-converter sets and track sectioning switchgear for the G.I.P. Railway electrification. (See this issue.)

April 13th. 23 electric passenger locomotives. (See this issue.)

Kettering.—March 9th. Electricity Department. E.h.p. and l.p. cables. (See this issue.)

March 23rd. Transformers, e.h.p. and l.p. switchgear, one 1,500-kW rotary converter equipment, and one steam turbo-boiler feed pump. (See this issue.)

Leeds.—March 2nd. Tramways and Transport Department. Stores for year ending March 31st, 1927, including electrical sundries. Particulars from Mr. W. Chamberlain, general manager, 1, Swinegate.

Leicester.—Electricity Department. One 18,750-kW, 3-phase turbo-alternator, with condensing plant. (February 12th.)

Leytonstone.—West Ham Union. Alterations to the electric lighting station and the installation of a steam-driven generating set, &c., at the Central Home, Leytonstone. (February 19th.)

London.—ST. PANCRAS.—March 2nd. Electricity Department. E.h.p. switchgear at the Grafton Road sub-station. (February 5th.)

HOLBORN.—March 10th. Board of Guardians. Electrical fittings for six months. Forms of tender from Mr. C. J. Cross, Clerk to the Guardians, 53, Clerkenwell Road, E.C.1.

STEPNEY.—March 4th. Board of Guardians. Electrical fittings for six months. Mr. S. McClelland, clerk to the Guardians, Raine Street, Old Gravel Lane, E.1.

Manchester.—March 22nd. Electricity Department. 3-phase, 420-V sub-station switchgear, 3-phase, 6,600-V and 11,000-V ditto, three 500-kVA static transformers, and one 7,500-kVA forced-air-cooled transformer. (February 19th.)

March 22nd. One 5-ton electric tipping wagon and one 10-ton electric tractor with trailer. (See this issue.)

Newark-upon-Trent.—March 16th. Electricity Department. Medium and l.p. switchgear and accessories. (See this issue.)

New Zealand.—WELLINGTON.—April 23rd. Public Works Department. 11,000-V metering equipment and switchgear for the Arupuni electric power scheme.*

Oldham.—March 2nd. Electric lighting fittings at Bardsley Conservative Club. Particulars from Mr. E. W. Robins, secretary.

March 8th. Board of Guardians. Electric lamps and fittings. Form of tender from Mr. F. W. Fletcher, clerk to Board of Guardians, Union Offices.

Portsmouth.—Electricity Supply Department. Erection of a steel-frame turbine house. (February 19th.)

Preston.—March 12th. Electricity Department. 4,200 yd. (approx.) e.h.p. cable and four sets of e.h.p., 3-phase transformers. (See this issue.)

Rochdale.—March 16th. Gas and Electricity Committee. One 1,250-kW (or alternatively 1,500-kW) rotary-converter equipment, including transformer and switchgear. (See this issue.)

Town Council. Electric lighting and power installation, 34 houses, Clarke's Lane housing estate. Particulars from borough surveyor.

South Africa.—JOHANNESBURG.—April 12th. S.A. Railways and Harbours. Electrification of Cape Town Suburban Railway. Supply and erection of the overhead equipment of the permanent way and overhead transmission and distribution lines. (February 12th.)

CAPE TOWN.—March 17th. Electricity Department. Electric cables, electric light poles, cross arms, insulators, &c.

MOOREESBURG.—March 20th. Municipal Council. Engine-room equipment, including oil engines and tanks, main generators, motor booster, pumps and air compressor, travelling crane, switchboard, battery and connections, distribution system, instruments, meters, &c.; and house service connections.*

Tynemouth.—March 15th. Electricity Department. One 250-kVA transformer. (See this issue.)

Warrington.—March 15th. Electricity and Tramways Committee. Motors and transformers. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Billericay.—Board of Guardians. Accepted:—
Installing electric lighting at the new infirmary buildings (£682).—Ellis and Ward.

Calne.—Town Council. Accepted:—
Switchboard (£176).—Crompton & Co., Ltd.

Deal.—War Memorial Hospital Committee. Accepted:—
Installation of a wireless set (£131), including a steel mast and spare h.p. batteries.—C. O. Clark.

Egypt.—Egyptian Ministry of the Interior. Accepted:—
H.p. underground and l.p. overhead distribution system (£9,886), for the municipality of Zifta; one 240-kVA and two 120 kVA alternators, with h.p. and l.p. switchgear, &c. (£5,307), for the municipality of Minieh; and one 25-kVA alternator, with Willans Diesel engine; one 160-kVA rotary-converter, with h.p. and l.p. switchgear, &c. (£7,101).—British Thomson-Houston & Co., Ltd.

Edmonton.—
Electrical work at the Education Offices.—Ridout & Ratcliff, Ltd.

Glasgow.—Tramways Committee. Accepted:—
Trolley feeder cable.—Siemens Bros. & Co., Ltd.
Lead-covered cable.—Standard Telephones & Cables, Ltd.
Dust exhaust plant.—James Keith & Blackman & Co., Ltd.

Water Committee. Accepted:—
Electric lighting fittings, &c., at Glengyll House (£353).—Allan Arthur and Ure.

Health Committee. Recommended:—
Electric lighting work at Bellefield Sanatorium (£1,215).—Haddow & Co.

Electricity Committee. Recommended:—
1,500-kW rotary-converter (£5,622).—British Thomson-Houston Co., Ltd.

Government Contracts.—The undermentioned Government contracts were placed during January, 1926:—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.

Accumulators.—Chloride Electrical Storage Co., Ltd.
Turbo-alternators.—C. A. Parsons & Co., Ltd.
Batteries.—Premier Accumulator Co., Ltd.
Cells and accumulators.—London Battery & Cable Co., Ltd.
Cells.—Fuller's United Electric Works, Ltd.; Edison Swan Electric Co., Ltd.
Air compressors.—P. Brotherhood, Ltd.
Electrically-driven compressors.—Belliss & Morcom, Ltd.
Electrodes.—Alloy Welding Processes, Ltd.
Electric lamps.—British Thomson-Houston Co., Ltd.; Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.; Metro-Vick Supplies, Ltd.; Siemens & English Electric Lamp Co., Ltd.
Overhead electric traveller.—T. Smith & Sons (Rodley), Ltd.

WAR OFFICE.

Aluminium ingot.—British Aluminium Co., Ltd.
Generating sets.—W. H. Dorman & Co., Ltd.
Switchgear and switchboard.—Johnson & Phillips, Ltd.
Transformers.—Newton Bros., Ltd.
W./t. valves.—Edison Swan Electric Co., Ltd.

AIR MINISTRY.

Alternators and switch panels (Kidbrooke).—Electric Construction Co., Ltd.
Conversion of single-phase supply (Cardington).—G. E. Taylor & Co.
Engines and generators (North Weald and Upper Heyford.)—Blackstone and Co.
Generating sets (Waddington).—W. H. Allen, Sons & Co.
Internal wiring (Heyford).—Lea, Son & Co., Ltd.
Oil-engine generating sets (Karachi).—Babcock & Wilcox, Ltd.
Control resistance and voltmeter.—Pyne Mfg. Co., Ltd.
Electric cable.—W. T. Henley's Telegraph Works Co., Ltd.
Generators and spares.—Mortley, Sprague & Co., Ltd.; Small Electric Motors, Ltd.
Repair of transmitters.—Gambrell Bros., Ltd.
W./t. valves.—Edison Swan Electric Co., Ltd.

POST OFFICE.

Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; British L. M. Ericsson Mfg. Co., Ltd.; General Electric Co., Ltd.; Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Telegraph Condenser Co., Ltd.
Testing protective apparatus.—British L. M. Ericsson Mfg. Co., Ltd.; Phœnix Telephone & Electric Works, Ltd.; Reliable Engineering Co., Ltd.
Battery stores.—Alton Battery Co., Ltd.; D. P. Battery Co., Ltd.
Cable (various).—British Insulated Cables, Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; W. T. Glover & Co., Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Union Cable Co., Ltd.
Telephone cords.—British Insulated Cables, Ltd.; London Electric Wire Co. & Smiths, Ltd.; Standard Telephones & Cables, Ltd.
Lamps.—A. C. Cossor, Ltd.
Tumbler switches.—J. A. Crabtree & Co., Ltd.
Earth plates, rod stays, stay swivels.—Bullers, Ltd.
Enamelled wire.—London Electric Wire Co., Ltd.
Batteries (Manchester telephone trunk exchange).—Alton Wire Co., Ltd.
Manufacture, supply, drawing-in and jointing cable.—Sheffield-Rotherham: British Insulated Cables, Ltd. Leicester (Rothley)-Loughborough: Siemens Bros. & Co., Ltd.
Manufacture, supply, drawing-in, &c., cable and installing loading coil cases.—London-Canterbury: Standard Telephones & Cables, Ltd.
Electric lift (Manchester, superintending engineer's office).—J. Bennie, Ltd.
Telephone exchange equipment.—Marton, Wimbledon, Southall, Waterloo: Automatic Telephone Mfg. Co., Ltd. Douglas (Glasgow), Birmingham (Midland), Jesmond (Newcastle-on-Tyne), Paddington: Standard Telephones & Cables, Ltd. Western (London): Siemens Bros. & Co., Ltd. Sub-contractors: Hart Accumulator Co., Ltd., for batteries; Newton Bros. (Derby), Ltd., for machines. Wakefield: Siemens Bros. & Co., Ltd. Sub-contractors: Chloride Electrical Storage Co., Ltd., for batteries; English Electric Co., Ltd., for charging machines; Crompton & Co., Ltd., for ringing machines. Sandal (Wakefield), Grimsby, Letchworth: Siemens Bros. & Co., Ltd. Keighley: General Electric Co., Ltd. Sub-contractors: Chloride Electrical Storage Co., Ltd., for batteries; Crompton & Co., Ltd., for machines. Mansfield: General Electric Co., Ltd. Newcastle-on-Tyne (Central): British L. M. Ericsson Mfg. Co., Ltd. Sub-contractors for batteries: Tudor Accumulator Co., Ltd.; for ringing machines: Crompton and Co., Ltd.
Private branch exchange telephone equipment.—Birmingham Chamber of Commerce; A. W. Bain & Sons (Leeds); Kendal, Milne & Co. (Harrods), Ltd., Manchester. Bristol Docks Committee: Stewart, Thompson & Co., Ltd. (Manchester); Blake & Co., Ltd. (Liverpool). Lambeth Borough Council; Bradford (Yorks.) Royal Infirmary; Eastbourne Corporation: Relay Automatic Telephone Co., Ltd.
Telephone repeater station (voltage control board).—Fenny Stratford: Newton Bros. (Derby), Ltd.

H.M. OFFICE OF WORKS.

Wiring Ministry of Pensions Hospital, Leeds.—A. Innes.
Wiring Montague House, S.W.—R. Langston-Jones & Co.

CROWN AGENTS FOR THE COLONIES.

Electric cable, &c.—W. T. Henley's Telegraph Works Co., Ltd.
Diesel engine and generator.—English Electric Co., Ltd.
Electric equipment.—J. Stone & Co., Ltd.
Flood alarm cabinets, &c.—General Electric Co., Ltd.
Insulated cables.—St. Helens Cable & Rubber Co., Ltd.
Train-lighting cells.—D. P. Battery Co., Ltd.
Telegraph instruments, &c.—Walter's Electrical Mfg. Co., Ltd.
Telegraph ironwork, &c.—Bullers, Ltd.
Telephone exchanges.—Peel-Conner Telephone Works.
Telephones and switchboards.—Standard Telephones & Cables, Ltd.
Copper wire, &c.—F. Smith & Co.; Shropshire Iron Co., Ltd.
Stannos wire, &c.—Siemens Bros. & Co., Ltd.

Irish Free State.—DUBLIN.—The following contracts were placed by the Commissioners of Public Works during the month of January :—

Installation of electric lighting at Irish Land Commission offices, Upper Merrion Street, Dublin.—Handley & Robinson, Ltd.
Installation of electric lighting at Munster Institute, Cork.—Brooks, Thomás & Co., Ltd.—*Irish Builder and Engineer.*

Lamp Contracts.—The Southern Railway has placed contracts for six months for the supply of electric lamps with the British Thomson-Houston Co., Ltd., the Siemens and English Electric Lamp Co., Ltd., and the Edison Swan Electric Co., Ltd.

Letchworth.—

Electrical work for the new abattoir.—Ridout & Ratcliff, Ltd.

London. — ISLINGTON. — Electricity Committee. Recommended :—

Commutator and motor (£75).—John Phillips & Co.

South Africa.—According to the *Evening News*, a contract for a 10,000-h.p. motor-driven winder for a gold mine in South Africa has been placed with Messrs. Fullerton, Hodgart and Barclay, Ltd.

Sowerby Bridge.—Urban District Council. Accepted:—

Electrician's work in connection with the erection of a further 25 houses, Willow Street site.—Oakley, Green & Wilson, Halifax.

Walthamstow.—Urban Council. Accepted:—

Boiler-house plant for the electricity works (between £17,000 and £18,000). —Babcock & Wilcox, Ltd.
Economiser (£3,800).—E. Green & Son.

Willesden.—Electricity Committee. Recommended:—

H.p. cable for 12 months.—British Insulated Cables, Ltd.
L.p. cables for 12 months.—Pirelli-General Cables, Ltd.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

DUOLITE lamps.
EXPRESS electric urns.
DAINTY vacuum cleaners.

Forthcoming Events.

Physical Society of London.—Friday, February 26th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary Scientific Meeting.

Institution of Production Engineers.—Friday, February 26th. At 83, Pall Mall, S.W. Debate on "Payment by Results," to be opened by Mr. R. H. Hutchinson.

Birmingham Electric Club.—Friday, February 26th. At the Grand Hotel, Colmore Row, Birmingham. At 7 p.m. Discussion on "Power Factor," to be opened by Messrs. F. R. Unwin and F. C. Hall.

Institute of Transport.—Monday, March 1st. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 5.30 p.m. Paper on "State-ownership of Waterways," by Mr. H. D. Dickinson.

Glasgow Corporation Electricity Department Engineering Society.—Monday, March 1st. At the Welfare Hall, St. Andrew's Cross Works. At 7.45 p.m. Papers on "The Varying Length of Night with Latitude," by Mr. H. J. McEwen; on "Design and Detail," by Mr. J. Elliott; and on "Section Pillars and Mains Fittings," by Mr. A. Rutledge.

Society of Engineers.—Monday, March 1st. At Burlington House, W. At 5.30 p.m. Paper on "Tidal Power on the River Severn—Some Notes and Suggestions on its Utilisation," by Mr. W. M. Beckett.

Roentgen Society.—Tuesday, March 2nd. At 32, Welbeck Street, W. At 8.15 p.m. Ordinary meeting.

National Association of Supervising Electricians.—Tuesday, March 2nd. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. Paper on "Electricity Supply," by Mr. A. Kirk.

Ideal Home Exhibition.—At Olympia, W. From March 2nd to 27th.

Electrical Society of Glasgow.—Tuesday, March 2nd. At Glasgow. Paper on "Industrial Heating Appliances," by Mr. P. J. Sims.

Royal Society of Arts.—Wednesday, March 3rd. At John Street, Adelphi, W.C. At 8 p.m. Lecture on "Science in the Cable Industry," by Mr. P. Dunsheath.

Monday, March 1st. At 8 p.m. Cantor Lecture on "The Production and Measurement of High Vacua," by Dr. G. W. C. Kaye. (Lecture III.)

Institution of Heating and Ventilating Engineers.—Wednesday, March 3rd. At Caxton Hall, Westminster, S.W. At 7 p.m. Paper on "The Design and Application of Electric Motors Relating to Heating and Ventilating Installations," by Mr. J. Meech.

Edinburgh Electrical Society.—Wednesday, March 3rd. At the Royal Society of Art, 117, George Street. At 8 p.m. Paper on "Hydro-Electric Plant," by Mr. A. Arthur.

Institution of Electrical Engineers.—Thursday, March 4th. At the Institution, Victoria Embankment, W.C. At 5 p.m. Paper on "Electro-Farming, or the Application of Electricity to Agriculture," by Mr. R. B. Matthews.

(Wireless Section).—Wednesday, March 3rd. At the Institution, Victoria Embankment, W.C. At 6 p.m. Papers on "The Directional Recording of Atmospherics," by Mr. R. A. Watson Watt; and on "An Instantaneous Direct Reading Radiogoniometer," by Mr. R. A. Watson Watt and Mr. J. F. Herd.

(North-Western Centre).—Tuesday, March 2nd. At the Engineers' Club, Manchester. At 7 p.m. Paper, "Notes on the Testing of Static Transformers," by Mr. J. L. Thompson and Mr. H. Walmsley.

(Western Centre).—Monday, March 1st. At the South Wales Institute of Engineers, Cardiff. At 6 p.m. Lecture on "The Engineer: His Due and His Duty in Life," by Mr. T. Carter.

(East-Midland Sub-Centre).—Tuesday, March 2nd. At the Technical College, Derby. At 6.45 p.m. Paper on "Steam Pipes for Extra-High-Pressures and Temperatures," by J. A. Aiton.

(Sheffield Sub-Centre).—Wednesday, March 3rd. At the Royal Victoria Hotel, Sheffield. At 7.45 p.m. Ordinary general meeting and smoking concert. Address by the president, Mr. R. A. Chattock.

Royal Institution.—Thursday, March 4th. At 21, Albemarle Street, W. At 5.15 p.m. Lecture on "The Atom of Light and the Atom of Electricity," by Dr. C. D. Ellis.

Electrical Power Engineers' Association (Southern Division).—Friday, March 5th. At the Institution of Electrical Engineers, Victoria Embankment, W.C.2. At 7 p.m. Lecture on "A 50,000-kW Parsons Reaction Turbine," by Mr. C. D. Gibb.

Junior Institution of Engineers.—Friday, March 5th. At the Engineers' Club, Waterloo Street, Birmingham. At 7.30 p.m. Paper on "Hoisting Appliances," by Mr. C. H. Woodfield.

Friday, March 5th. At 39, Victoria Street, S.W. At 7.30 p.m. Paper, "Tendencies in Modern Electric Practice," by Mr. J. M. Seddon.

(North-Western Section).—Monday, March 1st. Paper on the "Behaviour of Metals Under Stress," by Mr. W. E. W. Millington.

Joint Delegation Dinner.—Friday, March 5th. At the Great Northern Hotel, Leeds. At 6.30 p.m. Dinner of the Joint Delegation of the Local (Yorkshire) Associations of the Engineering Institutions.

Association of Mining Electrical Engineers (Western District Sub-Branch).—Saturday, March 6th. At 62, Wind Street, Swansea. Discussion on "D.c. *versus* A.c. for Colliery Practice," to be opened by Messrs. G. W. Walton and H. Thomas.

Notes.

The Optical Convention, 1926.—We have received a copy of the particulars of the above Convention which is to be held at the Imperial College of Science and Technology, South Kensington, from April 12th to 17th inclusive. The programme of the Convention is set out and the privileges and subscriptions of membership are also given.

Decimal Coinage.—In accordance with the decision of the Grand Council of the Federation of British Industries, a letter was sent to the Treasury asking for an inquiry into the scheme suggested by Mr. Harry Allcock for decimalising the shilling. As a reply was received to the effect that in the view of the Treasury the new suggestion did not differ in any material particular from the scheme propounded by Lord Southwark and rejected by the majority of the Royal Commission in 1920, a further letter was submitted pointing out the ways in which the new suggestions differed from that scheme. The Treasury, however, again gave an unfavourable reply.

E.P.E.A. Dinner.—The North of Ireland Section of the Electrical Power Engineers' Association held its third annual dinner in Thompson's Restaurant, Belfast, on February 14th, when Mr. R. P. Watson (chairman) presided. The guests included the High Sheriff (Alderman Oswald Jamison), Councillor Major Hall-Thompson, Mr. J. F. Gordon, M.P., Mr. A. S. Ostler (president of the Association), and others. Mr. J. F. Gordon, in proposing "The Electrical Power Engineers' Association," said repeated statements had been made that some measures must be taken to reduce the disparity between the amount of electricity consumed for industrial, commercial, and domestic purposes by the people of Northern Ireland and their competitors in the world markets. The consumption per head of population in Great Britain was 200, Tasmania 500, Canada 900, and in some areas in the United States over 1,000 kWh. In Northern Ireland the average figure was 50.3 kWh, and there was considerable scope for further development. With the remarkable improvements which had been made in the last ten years in the generating practice in coal-fired stations, very little margin of benefit was left to the hydro-electric station, although in an undertaking of the latter type there were no recurring fuel costs. The Commission on the Development of the Natural and Industrial Resources had under examination the possibility of utilising in a comprehensive scheme the existing and potential sources of supply such as at Belfast, Londonderry, Coalisland, Lower Bann (Carnroe), and Strangford Lough, and thereby turning the natural resources into material benefits. It had been suggested that the electricity requirements of what might be termed the industrial area of Northern Ireland could be adequately met by the erection of a ring main system embracing the more important and densely populated towns circling Lough Neagh, with possible extensions at a later date to include the other important urban centres in Northern Ireland.

Local Society.—The second lecture of the session of the Sheffield Illumination Society was delivered by Mr. W. T. Wardale, on February 18th, on "How Electricity is Supplied to the Tramcars." The lecturer dealt with the generation and transmission of energy for tramway purposes.

Appointments Vacant.—Telegraph foremen (£400), for the Government of the Gold Coast. Switchboard attendant for Epsom U.D.C. Electric Light Department. Car shed superintendent (£338) for the Rawtenstall Corporation Electricity Department. Shift charge engineer, for the Kirkcaldy Corporation Electricity Works. Clerk of works, for the Borough of Newark Electricity Department. Junior assistant to the borough electrical engineer, for the Corporation of Ealing Electricity Department. (See our advertisement pages to-day.)

The Electrical Trades Benevolent Institution.—It is interesting to learn that Henley's Dramatic Club has promised to give in aid of the Institution a performance of the play "If Four Walls Told"—a village tale in three acts, by Edward Percy—at King George's Hall, Caroline Street, London, on Thursday, March 4th, at 8 p.m. Tickets, at prices from 10s. 6d. to 3s., all numbered and reserved, can be obtained from the assistant hon. secretary, Mr. E. J. King, at 98, Grosvenor Road, S.W.1. The well-known ability of the members of the club, and the desire to help the E.T.B.I., ought to ensure a full house.

London Traffic. — Lecturing on "Traffic Reform" on Sunday last, Sir Henry Maybury, chairman of the London Traffic Advisory Committee, said that the remedy for the traffic congestion was co-ordination—the pooling of resources and receipts, the elimination of waste, extension of tubes, and the electrification of the suburban railways. He looked forward to the early production of a scheme embodying all those features. Referring to the increased patronage of the omnibuses, at the expense of other forms of transport, Sir Henry said his Committee was unanimous in holding the opinion that tramways were essential to the movement of people in London.

Explosives in Coal Mines.—The Secretary for Mines announces that he has issued an Order, in pursuance of Section 61 of the Coal Mines Act, 1911, varying the list of "permitted explosives" used in certain classes of coal mines. Certain definitions of explosives have been amended, and others have been removed from the "permitted list." The Order may be purchased from H.M. Stationery Office, price 2d.

Very High-pressure Turbines.—It is reported that two large turbines, each 79 ft. long and weighing over 400 tons, working with steam at 600 lb. per sq. in., which is claimed to be the highest steam pressure now in commercial use in the United States, were recently put into commission at the new steam station of the Columbia Gas and Electric Company at Columbia Park, Ohio, at a cost of $20,000,000. The machines are of the tandem type, and are each rated at 45,000 kW. The steam is reheated to its original temperature, 725 deg. F., between the high and low-pressure sections. Fourteen stages accommodate the high-pressure and 12 the low-pressure sections. Steam is bled from the turbines, after partial expansion, for feed-water heating. The estimated daily coal consumption of the two machines is about 1,000 tons, and, for each ton of coal, from 400 to 450 tons of water. Provision is made in the station for eight turbines.

The Electrode Capacity and Resistance of Electrolytes.—It has long been known that a capacity effect exists at the surface of an electrode placed in an electrolytic solution, and it is in consequence of this effect that, when measuring the resistance of such a solution by means of a Wheatstone bridge, with a telephone as indicator, one never obtains complete silence. Wien showed, in 1896, that, in addition to a capacity effect, there is also an extra resistance effect introduced by the electrodes. Various attempts have been made to arrive at the law connecting this extra resistance with the frequency of the current employed to measure it, but conflicting results have been obtained. The work described by Mr. B. B. Baneiji in his recent Faraday Society paper, entitled "The Electrode Capacity and Resistance of Electrolytes for a Wide Range of Frequencies," was undertaken with a view to clearing up the uncertainty that obtains, and a number of electrolytes have been examined to find the variation of polarisation capacity and resistance over a wide range of frequencies. The simplest combination of resistance and condenser behaves, unless one of them is either too high or too low, as a condenser whose capacity is a function of the frequency. In the case of an electrolytic cell, there is the further complication that the resistance is composed primarily of the electrolytic resistance, and secondarily of the electrode values, while the capacity effect is a purely electrode effect. Consequently, more was likely to be learnt if attention was directed towards the capacity of the cells, and that was the basis of the present work.

The method employed was that of the Wheatstone bridge for alternating current, the source of current being a triode valve generator. Reference must be made to the paper for full particulars of the experimental arrangements. The electrodes used were silver in silver nitrate, cadmium in cadmium sulphate, and nickel in nickel sulphate. The results show that over a wide range of frequencies up to 2,500 per second, the capacity may be represented by a hyperbola when plotted against the square of the frequencies. The inference is made that the phenomena at the electrodes may be very closely represented as due to two condensers, one of them leaking very heavily and the other only slightly. The interpretation of this hypothesis is based on the existence of the Helmholtz double layer, which would necessarily be accompanied by a capacity effect. If, further, the space between the layers be supposed large enough to enable a few charged particles to move at random between them, the case will be that of a leaky condenser, analogous to what would happen if two plates were placed in a gas containing a few ionised particles. This explains the presence of one leaky condenser. The other may be expected as a result of transport phenomena. When a small current passes through an electrolytic cell, there will be a change of concentration tending to establish an e.m.f. opposing the current proportional to the change in concentration, which change will itself be proportional to the quantity of electricity that has entered the cell. The effect will therefore be similar to that produced by a capacity, and diffusion will produce an effect similar to a small leak. From the values of the capacities measured, the thickness of the double layer can be calculated, and it is found to be consistent with the value found by other methods.

Improved Lighting Scheme.—As the result of a recent lighting scheme of the St. Marylebone Electricity Department, the illumination of Baker Street and Orchard Street has been greatly improved. Wembley lanterns, manufactured by the General Electric Co., Ltd., fitted with 750-W gasfilled lamps, have been adopted throughout the scheme and the accompanying illustration shows the double-fitting unit outside the Metropolitan Railway station. The body of the lantern is constructed of heavy-gauge sheet copper, and is suitably ventilated. A special protected focusing device enables the lamp to be adjusted inside the prismatic refractor and varied to give any required light distribution; adjustments can be made from the outside with extreme accuracy. The lantern has been subjected to many stringent tests, and fully complies, it is claimed, with all the indispensable requirements for a street lighting unit.

Wembley Lanterns in Baker Street.

Mines Report. — We have received a copy of the preliminary statement of the number of deaths caused by accidents in and about the mines and quarries of Great Britain during 1925. In all there were 1,140 separate fatal accidents, which resulted in 1,228 deaths, against 1,294 deaths for the previous year, when there were 1,224 fatal accidents. Of the total deaths 1,129 occurred at mines under the Coal Mines Act, and eight of these are attributed to the use of electricity, three under and five above ground. The number of deaths reported at mines under the Metalliferous Mines Regulation is shown as 23, and that reported at quarries, more than 20 ft. deep, under the Quarries Act, is recorded as 76. No deaths are attributed to the use of electricity under the last two sections. In addition, eight deaths at quarries 20 ft. or less deep were reported.

Research at Birmingham.—The Joint Standing Committee for Research, at the University of Birmingham, in the annual report just issued, states that in the Department of Electrical Engineering research work has been carried out on the conduction of currents by electrolytes; the testing of alternating-current machines by means of direct current; the behaviour of litho stone, and other semi-conductors; and the transmission of power at high frequencies.

Tramways and Light Railways Association.—ANNUAL CONGRESS.—As most of the available hotel accommodation at Bristol and Bath has already been bespoken by two other public bodies for the week selected by the Association and the week following, the Council has decided, after consideration, to hold the Congress at Torquay on June 24th and 25th instead of at Bristol.

Low-Temperature Carbonisation.—In a paper read by Mr. David Brownlie, B.Sc., before the Institution of Mining Engineers, he expressed the opinion that the next stage of evolution in steam power-station operation would be the combination of the low-temperature carbonisation of raw coal with the separation of the tar or crude oils and, if necessary, ammonia, and the combustion under the steam boilers of the residual gas, along with the smokeless low-temperature fuel, either in a pulverised condition or in the solid form, using travelling-grate stokers. He stated that it was impossible to go on burning 8,000,000 tons of raw coal per annum in the power stations of Great Britain. If carbonisation as part of the boiler plant operation was adopted, it would give every year about 20,000,000 gallons of motor spirit, 120,000,000 gallons of low-temperature tar, and 53,000 tons of sulphate of ammonia, while requiring 9,600,000 tons of coal instead of 8,000,000 tons for the same steam output. Many super-power stations to-day were burning 1,000 tons of raw coal per 24 hours, and it was not much of a step to carbonise this coal, which already had to be crushed, conveyed, and stored in overhead bunkers. The same remarks applied to other large furnaces, such as those used in the iron and steel, ceramic, glass and chemical industries. He urged the colliery industry in Great Britain to co-operate and study on scientific and practical lines the whole subject of low-temperature carbonisation; over 100 processes were available, and in many cases smokeless fuel and by-products could be sold to much better advantage than raw coal, while low-grade refuse fuels also were available for utilisation.

North Wales Dam Disaster.—The Government, in furtherance of its decision, as announced in the House of Commons on December 21st last, to make further investigations of a technical character into the design and construction both of the Dolgarrog dam which failed, and the other local dams under the control of the Aluminium Corporation and the North Wales Power Co., has, according to the *Financial News*, appointed the firm of Sir Alexander Gibb & Partners, chartered and consulting civil engineers, of Westminster, to hold a full investigation and report thereon.

Ships' Wireless.—The m.v. *Asturias*, which displaces 35,390 tons and was built at Belfast for the Royal Mail Steam Packet Co., is to sail from Southampton to-day (February 26th) on her maiden voyage to South America. She has been equipped by the Marconi International Marine Communication Co., Ltd., with a very complete wireless installation. The main telegraph installation consists of a 1½-kW quenched-spark transmitter, with emergency apparatus, and also a long-range valve transmitter. The receiving equipment consists of the standard long-range receiver embodying a four-electrode valve amplifier, with the addition of an extra-high-frequency amplifier, which makes the tuning extremely sensitive and very selective. Direction-finding equipment is carried as an aid to navigation. The aerials of this installation are mounted in an open teak framework 8½ ft. in height fixed rigidly to the deck, which method dispenses with the large aerial system hitherto employed. In addition, two of the lifeboats also carry Marconi ¼-kW transmitters of the quenched-spark type, the power supply being obtained from petrol-driven generators. Valve receivers, which also incorporate alternative crystal reception, are used in the lifeboats. A Marconi band repeater has been installed in the *Asturias*, and six loud-speakers can be used in any of a dozen selected places in various parts of the vessel in order that music played by either the ship's orchestra, reproduced from a gramophone, or received by wireless, may be reproduced in any part of the vessel. The apparatus includes an amplifier, a generator with the necessary controlling apparatus, a control unit to change from microphone to gramophone, and a gramophone without sound box and horn. The amplifier station also includes a small loud-speaker to act as a pilot to the operator, thus keeping him informed as to what is going on at the various reproducing positions. The introduction of a small motor generator has made it unnecessary to include accumulator batteries with their attendant maintenance difficulties. The generator is driven by power from the ship's electric mains, and supplies the energy required both for the filament and anodes of the valves in the amplifier. In reproducing gramophone music, the scratching of the needle has been eliminated by the replacement of the sound box by an electrical device of the Marconi Co., by which the indentations of the gramophone record are converted directly into a varying electric current, which is amplified and passed on to the loud-speaker. In this way distortionless reproduction of the original music, or speech, on the gramophone record is claimed to be obtained, and the volume of music produced can be controlled through wide limits.

A Smoke Washer.—Organised by the Smoke Abolition Co., of Manchester, a demonstration of a smoke-washing device, capable of adaptation to works chimneys, &c., was given at Manchester on February 9th. Mr. H. M. Sidebottom, the inventor, conducted smoke from a boiler to a box enclosing a wheel that is bladed on the circumference. Water was played on to the blades, causing the wheel to revolve and the water to be sprayed in the smoke stream. The effect of this is to "increase the draught" and to facilitate the passage of the washed smoke. The discharged water laden with dirt from the smoke is filtered and the residue reclaimed. We are informed that the residuum can be put back on the fire and burned, thus extracting its latent potentiality of heat. It was explained that what otherwise would be waste contains valuable by-products.

Accumulator Manufacturers' Association.—The annual dinner of the Association was held at the Connaught Rooms, London, on Monday last, and was a very successful function. Our report will appear next week.

Gallium-in-Quartz High-temperature Thermometer.—A thermometer similar in appearance to the usual mercury-in-glass one, but capable of registering a temperature of more than 1,800 deg. F., has been developed in the Thomson Research Laboratory of the General Electric Co., of America, at Lynn, Mass., U.S.A. Instead of glass, which would melt at far lower temperatures, the thermometer bulb and stem are made of clear, fused quartz; and instead of mercury, which would boil and cause the thermometer to explode at such a temperature, gallium, one of the rarer metals, is used. A temperature of 1,000 deg. F. is the maximum with the mercury-in-glass thermometer, and such thermometers are inaccurate at high temperatures. By the use of mercury-in-quartz, German scientists attained a previously maximum temperature of about 1,300 deg. F.

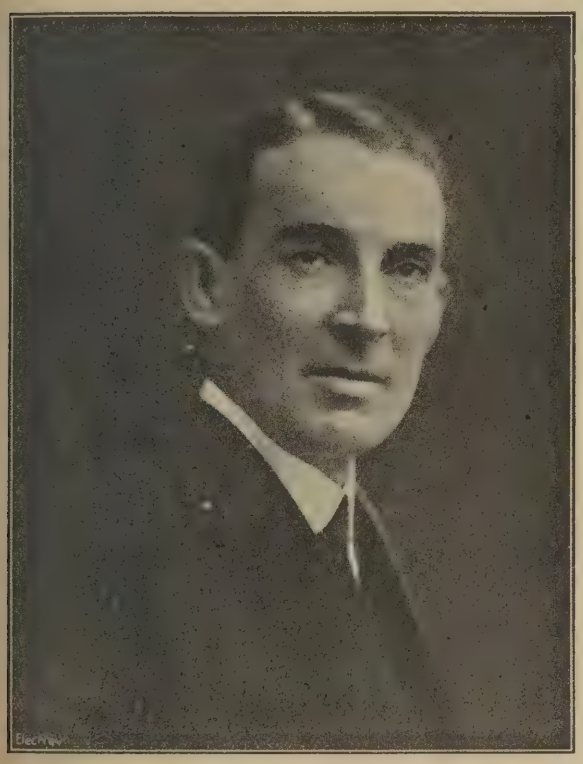
The development of a method for the commercial production of clear fused quartz as tubing was the first development in the Thomson research laboratory that made the new instruments possible. Gallium is similar to mercury in appearance, but is much lighter in weight. It melts at a temperature of 100 deg. F., but can be cooled to about 40 deg. before solidifying. Gallium boils at about 3,600 deg., so that it is not necessary to have it under pressure in the thermometer.

Motor Vehicle Parade.—The 20th annual London parade of commercial motor vehicles, organised by the Commercial Motor Users' Association (Incorporated), will take place in Lincoln's Inn Fields, on March 27th, under the patronage of His Majesty the King. The British Electrical Development Association (Inc.) is co-operating with the C.M.U.A. in connection with the electric-vehicle class of the parade, and special prizes will be awarded to the drivers of the winning vehicles in this class.

London's Postal Tube.—An account of the expenditure in respect of the London Post Office Tube railway has been issued as a White Paper. It is shown that the total expended to March 31st last was £1,100,000, which is the full amount authorised. The heaviest item is tunnelling cost, which aggregates £780,007, while permanent way, &c., involves £165,381. Preliminary expenses and professional fees are returned at £44,512.

Institution Notes.

Institution of Electrical Engineers.—The semi-jubilee of the Scottish Centre of the Institution of Electrical Engineers was celebrated on February 17th, when about 300 members and friends met in the Grosvenor Restaurant, Gordon Street, Glasgow. The function took the form of a dinner, whist drive, and dance, and Prof. Magnus MacLean, D.Sc., chairman of the Centre, presided. Representatives from all branches of the electrical industry in the West of Scotland were present. Music by Mr. J. Meredith Kay's Orchestra added to the pleasure of the evening, and the Committee responsible was congratulated on the successful way in which the arrangements were carried through.



Institution of Fuel Economy Engineers.—The second Council meeting of the Institution of Fuel Economy Engineers was held in London on Friday, February 12th, when four additional members were elected to the Council, making the total now 16. Thirteen new members were elected. It was decided that for associate members the annual subscription would be £2 2s., and for students £1 1s. It was also decided that preferential terms should be given to full members who are full members of other leading institutions, which reduces the fee in such cases from £3 3s. to £2 2s. Amongst the members of Council are Messrs. John Bruce, A.M.I.E.E., A. W. A. Chivers, M.Inst.T., L. M. Jockel, A.M.I.E.E., E. W. L. Nicol, A.M.I.E.E., A. Hugh Seabrook, M.I.E.E., W. Alderson Smith, F.C.I.S., Charles P. Sparks, C.B.E., M.I.E.E., John D. Troup, M.I.Mech.E., and Prof. R. V. Wheeler, D.Sc. The scope of the Institution covers every phase of fuel technology; its main objects are: To promote the science and practice of fuel economy engineering in all its branches, and to facilitate the interchange of ideas respecting improvements in the various branches of fuel technology. The next Council meeting will be held in London on March 19th, and the temporary office is at 29, Sherwin Road, Lenton, Nottingham (Mr. H. L. Pirie, secretary).

Diesel Engine Users' Association.—At the February meeting of the Association Mr. Geoffrey Porter read a paper on "Heavy-Oil Engine Installations; Choice of Site and Lay-out of Plant," pointing out that importance had to be attached to the avoidance of vibration, and in this connection the most favourable type of sub-soil was one that was dry and consisted of closely compacted particles capable of small relative movement. In deciding upon the number and individual capacity of generating sets for a given total capacity, the primary consideration to be borne in mind was the running plant load factor; the range of capacity should be such that no engine would be required under normal circumstances to operate at light loads, a light load being estimated as one below 50 per cent. of the maximum continuous rating of the engine.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

On February 13th, the staff of the Grimsby Corporation Electricity Works gave a complimentary dinner to Lieut.-Col. W. A. VIGNOLES, D.S.O., at the Oberon Hotel, to celebrate the 25th anniversary of the starting of supply on February 13th, 1901. Mr. Vignoles was engineer-in-charge of the erection of the plant at that date and he was placed in charge of the undertaking in the following April. Mr. A. S. Channon presided. Mr. Vignoles was presented with a gentleman's wardrob and Mrs. Vignoles with a combined silver cake-dish and casserole. About 80 sat down to dinner, the only guests in the number being Councillors W. H. Thickett and W. E. Fletcher (chairman and vice-chairman of the Electricity Committee). An appropriate and humorous menu had been prepared by Mr. S. S. Russell, a member of the staff. Mr. Channon, in making the presentation, said that Mr. Vignoles was a gentleman

Lt.-Col. W. A. Vignoles, D.S.O.
Borough Electrical Engineer of Grimsby.

in every sense of the word and that the undertaking had been successful largely because of the manner in which he had conducted its affairs. Mr. Vignoles, in responding, referred to the loyalty of the staff and the excellent way in which they all pulled together. Mr. J. Magee proposed the toast of the Chairman and Vice-Chairman of the Corporation Electricity Committee, and both gentlemen replied.

Mr. F. R. GIBSON, station superintendent to the Portsmouth Corporation tramways, who is shortly retiring under the superannuation scheme after a service of 25 years, was last week presented by the staff of the Engineer's Department with a barometer, cigars and an illuminated address, and an umbrella for Mrs. Gibson. Mr. Lironi, the chief engineer, made the presentation in the power station engine room.

The Exeter Electricity Committee has recommended the City Council to increase the salary of Mr. MUNRO, the electrical engineer, to £790, which is the recognised minimum.

Mr. R. S. J. NEVE has been appointed to succeed Mr. C. Batt as superintendent of Post Office Telegraphs at Bournemouth. He has been in the telegraph service for 41 years.

Of 23 applicants for the post of tramway manager at Portsmouth, at a commencing salary of £1,000 a year, Mr. BEN HALL, tramway manager of Halifax, is recommended for appointment by the Town Council.

Mr. A. GOODWIN, of Messrs. C. A. Vandervell & Co., Ltd., is taking a prolonged rest from business, which it is hoped will completely restore him to health.

A presentation is to be made to-day, Friday (4 p.m.), at the Institution of Electrical Engineers to Mr. HARRY BOOTH, O.B.E., on behalf of his many friends in all branches of the electricity supply industry. Sir Harry Renwick is to make the presentation and speeches will be made by representative leaders of the industry.

Obituary.—MR. A. E. GIFFEN.—The death is announced, at the age of 55 years, of Mr. Alexander Ewing Giffen, A.M.I.E.E., of Stoke-on-Trent, who was for a number of years sectional engineer for the Post Office Telephones and Telegraphs in the Hanley Section. He had been associated with the P.O. Engineering Department since 1897.

MR. H. B. HORNE.—The death took place on February 7th, of Mr. Henry Balfour Horne, chief draughtsman to the Yorkshire Electric Power Co., Ltd. He had been with the company for 17 years, and was stationed at Dewsbury prior to the transfer of the staff to Leeds about a year ago.

MR. B. CUDE.—The death occurred on February 6th, as the result of injuries sustained whilst motor-cycling, of Mr. Bert Cude, who was a member of the engineering staff of the Leatherhead Electricity Works. He was 24 years of age.

MR. H. HOWARD.—The death occurred, suddenly, on February 14th, of Mr. Henry Howard, who was electrical engineer to Lord Norbury, of Greenwood, Withyham, Sussex. He was 40 years of age.

MR. A. P. LUNDBERG.—We regret to learn, at the moment of going to press, that Mr. A. P. Lundberg, M.I.E.E., passed away on February 22nd, after a long illness, in his 95th year.

PROF. H. K. ONNES.—We regret to record the death of Prof. Heike Kamerlingh Onnes, Emeritus Professor and Director of the Physical Laboratory at Leyden University. He was born at Groningen in 1853, and became Professor of Experimental Physics in 1882 at Leyden, where he carried out researches on gases at high pressures and low temperatures, which culminated in the liquefaction of helium in 1908 at 4.5 degrees on the absolute scale. Later, he attained a temperature of about one degree above absolute zero, and he proved that, as had long been anticipated, the electrical resistance of metals practically disappeared in the neighbourhood of the absolute zero of temperature. He was awarded the Nobel prize for physics in 1913, and the Rumford medal of the Royal Society in 1916, besides receiving many other distinctions.

MR. MARTIN F. ROBERTS.—We learn with deep regret that Mr. Martin Fenn Roberts, M.Inst.C.E., M.I.E.E., F.C.S., passed away suddenly on February 22nd, at Brandshatch Place, Fawkham, Kent, at the age of 72 years. Mr. Roberts was a director of W. T. Henley's Telegraph Works Co., Ltd. He was formerly assistant engineer-in-chief to the General Post Office.

Will.—The late SIR G. S. GIBB left £46,501 gross and £40,815 net personalty.

New Companies Registered.

Shipton Automatic Telephone System, Ltd. (211,744).—Private company. Registered February 15th. Capital, £100 in £1 shares. Objects:—To carry on the business of telephone, telegraph, electrical, mechanical, and general engineers, manufacturers of, and dealers in, importers and exporters of, and dealers in instruments, accessories, components, and installations used in connection therewith, &c. The directors are:—E. Shipton, A.M.I.E.E., 2, Belgrade Road, Stoke Newington, N.16 (managing and permanent director); E. J. Baker, 4, Oxford Road, Snakes Lane, Woodford; V. A. P. Stokes, Frog Hall, Wokingham. Solicitors: Rubenstein, Nash & Co., 5 and 6, Raymond Buildings, Gray's Inn, W.C. Registered office: 37, Tothill Street, Westminster.

Elpar, Ltd. (211,715).—Private company. Registered February 13th. Capital, £2,000 in 500 6 per cent. cumulative preference and 1,500 ordinary shares of £1 each. Objects:—To adopt an agreement with A. C. Chapple and to carry on and turn to account the business of an electrical, mechanical, and radio engineer carried on by him at 20, Eltham Road, Lee Green, Kent. The directors are:—A. C. Chapple, 39, Woodside Crescent, Sidcup, Kent; A. T. K. Moir, 46, Wisteria Road, Lewisham, S.E.13, electrical engineer; V. W. Cunis, 40, Hampden Avenue, Beckenham, Kent, engineer. Remuneration as fixed by the company. Secretary: A. C. Chapple, 20, Eltham Road, Lee Green, Kent. Solicitors: Lendon & Carpenter, 31, Budge Row, E.C.4. Registered office: 20, Eltham Road, Lee Green, Kent.

Siemens and General Electric Railway Signal Co., Ltd. (211,382).—Registered as a "private" company on January 28th (delayed at Somerset House), with a nominal capital of £20,000 in £1 shares (10,000 "A" and 10,000 "B"). The "A" and "B" shares rank *pari passu* as a single class, except that they confer certain rights of appointing directors. The objects are to acquire the goodwill, stock, and assets referred to in an agreement between the General Electric Co., Ltd., of the first part, Siemens Bros. & Co., Ltd., of the second part, and this company of the third part, to design, manufacture, and deal in railway signalling installations and apparatus, to construct and carry out railway, electrical, and other works and conveniences, &c. The first directors are:—Max J. Railing, "Whiteknights," Reading (director of General Electric Co., Ltd.); Sydney D. White, "Arundel," Upper Brighton Road, Surbiton, Surrey (director of General Electric Co., Ltd.); Francis Hird, Lanark House, Fairfield Road, Old Charlton, S.E. (director, Siemens Bros. & Co., Ltd.); Dr. Hy. R. Wright, 51, Westcombe Park Road, Blackheath, S.E.3 (general manager, Siemens Bros. & Co., Ltd.). The first two named represent the "A" and the last two named the "B" shareholders. No qualification required. Remuneration as fixed by the company. Secretary: A. M. Hicks. Solicitors: Wild, Collins & Crosse, Kennan's House, Crown Court, Cheapside, E.C.2. The registered office is at Caxton House, Tothill Street, S.W.1.

E. A. Wilson & Co., Ltd. (211,770).—Private company. Registered February 16th. Capital, £1,000 in £1 shares. Objects:—To acquire the business of a manufacturer of wireless components, engineer and brass founder carried on by E. J. C. Liney (formerly carried on by E. A. Wilson), at 88, Shadwell Street, Birmingham, as "E. A. Wilson & Co." The permanent directors are:—E. J. C. Liney, 164, Orphanage Road, Erdington, Birmingham; and E. A. Wilson, 13, Woodall Road, Witton, Birmingham. Qualification, 100 shares. Solicitors: A. C. Jaques, 102, Colmore Road, Birmingham. Registered office: 88, Shadwell Street, Birmingham.

Fountain Bros., Ltd. (211,790).—Private company. Registered February 17th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of, dealers in and agents for all kinds of ironmongery and builders' materials, electrical machinery, plant, switchgear, apparatus and supplies, cables, &c. The subscribers (each with one share) are:—H. J. Fellowes, 56, Rathcoole Gardens, Hornsey, N.8, solicitor's clerk; W. C. Paske, 31, Amerland Road, Wandsworth, S.W.18, solicitor's clerk. The first directors are: H. J. Fountain and P. G. Fountain. Solicitors: P. S. Solomon, Archer & Co., 110, Cannon Street, E.C.4.

Anodon, Ltd. (211,864).—Private company. Registered February 19th. Capital, £15,001 in 10,000 "A" and 5,000 "B" shares and 1 arbitrator's share of £1 each. The arbitrator's share shall not confer upon the holder any right to participate in the profits, but shall rank for repayment of capital *pari passu* with the "A" and "B" shares. Objects:—To adopt an agreement with I. Knowles and F. J. Knowles, and to carry on the business of manufacturers of, agents for, and dealers in wireless and electrical instruments and accessories, &c. The subscribers are:—**H. T. Phillips, 247, Evering Road, Clapton, E.5, confectioner, 1 "B" share; I. Knowles, "Stonyhurst," Chalfont St. Peter, merchant, 1 "A" share.** The above subscribers shall be two of the first directors and shall be permanent. There may from time to time be appointed in respect of the company an arbitrator director. Solicitors: Horner & Horner, Fitzalan House, Arundel Street, W.C.2.

Ballycastle Electric Light and Power Co., Ltd. (B.I.304).—Private company. Registered in Belfast on February 3rd. Capital, £7,000 in £1 shares. Objects:—To carry on the business indicated by the title. The directors are:—J. McKavanagh, 26, Ballyholme Esplanade, Bangor, gentleman; J. Dobbin, 136, Manor Street, Belfast, electrical engineer; W. McPeake, 136, Manor Street, Belfast, electrical engineer; J. Smyth, 65, North Street, Newtownards, electrical engineer. Qualification, 500 shares. Secretary: J. Dobbin. Registered office: 133, Royal Avenue, Belfast.

Rowland's Electrical Accessories, Ltd. (211,738).—Private company. Registered February 13th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of manufacturers, importers, exporters, and repairers of, agents for and dealers in electric light fittings and accessories, general electrical goods, and instruments for use in connection with radio or wireless-telegraphy and telephony, &c. The permanent directors are:—W. R. Hill, "Seaward," The Cliff, Roedean, Brighton; O. R. Hill, 11, Broadfields Road, Erdington, Birmingham. Qualification, 1 share. Secretary: O. R. Hill.

Official Returns of Electrical Companies.

Associated Battery Co., Ltd.—F. W. Pixley, of 58, Coleman Street, E.C.2, ceased to act as receiver or manager on December 31st, 1925.

New Welding Co. (Southern), Ltd.—C. G. Arnold, of 26, Rosebery Avenue, E.C., was appointed receiver and manager on February 9th, 1926, under powers contained in debentures dated November 7th, 1923.

Electrical Insulating Composition Co., Ltd.—J. Lucas, of 26, Birley Street, Blackpool, I.A., ceased to act as receiver or manager on December 31st, 1925.

British Automatic Telephone Installation Co., Ltd.—Debenture dated January 27th, 1926, to secure £300, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: S. F. O'Hara, 148, Shaftesbury Avenue, W.C.2.

Win-Sum Electric Diffusers, Ltd. — Particulars filed of £1,000 debentures authorised January 27th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Rose Bros. Electrical Co., Ltd. (175,986).—Capital, £20,000 in £1 shares. Return dated October 26th, 1925. 10,002 shares taken up. £2 paid. £10,000 considered as paid. Mortgages and charges, £5,000.

Robin Electric Lamp Co., Ltd. (125,723).—Capital, £75,000 in £1 shares. Return dated October 29th, 1925. 60,352 shares taken up. £10,300 paid. £50,000 considered as paid. £52 in arrears of calls. Mortgages and charges, nil.

Barnsley and District Traction Co., Ltd. (72,962).—Capital, £125,000 in 50,000 preference and 75,000 ordinary shares of £1 each. Return dated June 24th, 1925. 22,000 preference and 60,105 ordinary shares taken up. £62,070 paid on 22,000 preference and 40,070 ordinary shares. £20,035 considered as paid on the remainder. Mortgages and charges, £19,928 4½ per cent. debenture; £29,000 second debenture issued to bankers as collateral security.

Shoreham and District Electric Lighting and Power Co., Ltd. (176,995).—Capital, £27,500 in £1 shares. Return dated December 31st, 1925. 17,329 shares taken up. £10,579 paid. £6,500 considered as paid. £250 in arrears. Mortgages and charges, nil.

Tubes, Ltd. (91,224).—Capital, £150,000 in £1 shares. Return dated October 27th, 1925. All shares taken up. £107,584 paid (being £1 per share on 82,859 and 10s. per share on 49,450 shares. £42,416 considered as paid (being £1 per share on 17,691 and 10s. per share on 49,450 shares). Mortgages and charges, nil.

Nox Electric Lamp Co., Ltd. (189,377).—Capital, £2,000 in £1 shares. Return dated December 31st, 1925. 502 shares taken up. £2 paid. £500 considered as paid. Mortgages and charges, debentures £662 13s. 4d.

Pirelli, Ltd. (103,068).—Capital, £250,000 in £1 shares. Return dated December 11th, 1925. 200,000 shares taken up. £200,000 paid. Mortgages and charges, nil.

Llangefni Electric Light and Power Co., Ltd. (11,909).—Capital, £3,000 in 2,750 preference and 250 ordinary shares of £1 each. Return dated November 2nd, 1925. 2,566 preference and 250 ordinary shares taken up. £2,566 paid. £250 considered as paid. Mortgages and charges, £2,400.

West India and Panama Telegraph Co., Ltd. (11,116).—Capital, £2,445,630 in 34,563 first preference, 10,000 second preference, and 200,000 ordinary shares of £10 each. Return dated November 4th, 1925. 34,563 first preference, 4,669 second preference, and 88,321 ordinary shares taken up. £1,275,530 considered as paid. Mortgages and charges, £89,100.

Callender's Cable & Construction Co., Ltd. (48,915).—Capital, £1,300,000 in 500,000 ordinary, 400,000 preference, and 400,000 "B" preference shares of £1 each. Return dated June 11th, 1925. All shares taken up. £1,025,000 paid. £275,000 considered as paid. Mortgages and charges, £300,000.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

The "Underground" Group.

We have received copies of the reports of the companies forming this group which were to be presented at the annual meetings yesterday (Thursday); they are summarised below:—

London Electric Railway Co.—The traffic receipts rose by £52,462 to £1,914,183, while the expenditure decreased by £4,609 to £1,131,814, leaving net receipts of £782,369—an increase of £57,071. The addition of miscellaneous revenue and £74,506 brought forward, gave an available balance of £1,045,331. Interest, rentals, &c., absorbed £452,625; £45,000 has been transferred to reserve (as in 1924); preference dividends required £126,947; a total dividend of 3½ per cent. on the consolidated ordinary stock took £326,478; and a balance of £94,281 is carried forward. During the year the capital expenditure amounted to £949,776, the principal items being £471,513 in respect of the Charing Cross-Kennington extension and £305,143 for rolling stock. It is expected that the extension referred to will be opened for traffic about the middle of this year. A short connecting line is to be constructed between the Piccadilly section and the City and South London Railway at King's Cross. The new joint booking hall at Oxford Circus has been put into service.

Central London Railway Co.—The traffic receipts amounted to £511,346 (£36,621 decrease) and the expenditure to £340,250 (£32,741 decrease), leaving net receipts of £171,096, a fall of £3,880. To this were added miscellaneous receipts (£88,861) and the balance brought forward (£85,885), making £345,842, a decrease of £9,164. After providing for interest, rentals, &c., and preference dividend, transferring £40,000 to reserve (as in 1924), and paying a total dividend of 4 per cent. on the three classes of ordinary stock, a balance of £81,008 is carried forward. The year's capital expenditure was £182,591, of which the installation of escalators accounted for £158,992. The shareholders were to be asked to approve the promotion of a Bill to empower the company to raise additional capital and to carry out new works jointly with the Metropolitan District Railway Co. Considerable progress was made with improvements during the year.

City and South London Railway Co.—The traffic receipts at £539,310 were higher by £226,884, and the expenditure rose by £150,239 to £265,633. The net receipts were thus £273,677, an increase of £76,645. To this were added miscellaneous receipts of £42,877 and £18,766 brought forward, making £335,320. After transferring £25,000 to reserve and providing for interest and dividends (including 3 per cent. on the consolidated ordinary stock), a balance of £25,037 is carried forward. The capital expenditure was £1,466,299, the bulk of which (£1,040,897) was taken by the Clapham Common-Morden extension. It is anticipated that this extension will be ready for service by the middle of the year. The remodelling and improvement of the company's existing stations was continued during the year.

Metropolitan District Railway Co.—The traffic receipts amounted to £1,634,778 and the expenditure to £1,102,085, representing decreases of £14,744 and £39,475 respectively. The net revenue was thus £532,692, an increase of £24,731. To this was added miscellaneous receipts of £184,058 and £69,230 brought forward, making £785,981. The allocations included £45,000 to reserve and a total dividend of 3½ per cent. upon the ordinary stock, and £69,230 is carried forward. The capital expenditure was only £27,331, mainly upon manufacturing and repairing works and plant.

Summary of Results.—We reproduce below a comparative statement of the results of the four companies which, with the London General Omnibus Co., Ltd., participate in the "Common Fund":—

	1925. £	*Increase+ Decrease−* £
Traffic receipts	13,243,652	+473,451
Expenditure	11,088,255	+268,572
Net receipts	2,155,397	+204,879
Miscellaneous receipts (net)	834,144	+ 34,092
Total net income	2,989,541	+238,971
Deduct—		
Interest, rentals and fixed charges	1,320,545	+164,176
Appropriation to reserve for contingencies and renewals	455,000	+ 50,000
Dividends on guaranteed and preference stocks ...	389,477	—
Total deductions ...	2,165,022	+214,176
Balance	824,519	+ 24,795
Add balances from last year's accounts	308,889	− 74,888
Total amount available for dividends on ordinary stocks and shares and for other purposes	1,133,408	− 50,093
Amount paid in dividends on ordinary stocks and shares representing an average rate of 4.09 per cent. in 1925 and 4.43 per cent. in 1924	808,234	− 66,378
Balance carried forward to next year's accounts ...	325,174	+ 16,285

With the exception of the City and South London Railway (for which 1924 was an abnormal year), the railways showed decreased traffic, but the increase in the number of passengers carried by the C. & S.L. Railway caused a net increase in the total. The figures for the four companies were as follows:—

Passengers carried:—	1925.	
Ordinary	217,914,496	+12,033,369
Workmen	51,416,986	+ 5,937,680
Seasons	49,370,358	+ 2,374,708
Total ...	318,701,840	+20,345,757
Number of car-miles run	65,436,713	+ 6,540,634

The total capital of the four railway companies is £53,379,364—a slight increase. In addition, the capital of the Lots Road Power House Joint Committee amounts to £3,175,000.

Metropolitan Railway Co.

Lord Aberconway (the chairman) presided at the annual meeting on February 18th. In moving the adoption of the report and accounts (*vide* our last issue, p. 306) he said that the year 1924 with which those accounts were compared, was an exceptionally good year for the company

owing to the heavy traffic in connection with the British Empire Exhibition, and the strike which occurred in that year among tramway and 'bus employés, which gave the company a large amount of extra traffic. The attendance at Wembley in 1925 was only about half that of the previous year, and the company's receipts were not even half of those obtained in 1924, owing to the reduction in the price of tickets. Therefore, it was not surprising that the revenue for 1925 showed a considerable decrease, but the same dividend was being paid, as the company had considerably strengthened its financial position from the surplus accumulated in 1924; they had not, however, been able to transfer £25,000 to the general reserve fund again. The latter fund now stood at £125,000, and they did not consider it necessary to increase it further. The capital expenditure during the year amounted to £252,844; a number of important works were covered by this figure, some of which were already in use, while others were under construction. The new junction between the Circle and the widened lines to the east of Euston Square was approaching completion. The capital account was overdrawn to the extent of £1,144,000, but they had taken a favourable opportunity of disposing of 750,000 3½ "A" debenture stock, which had reduced the debit by nearly one half. Further stock would be issued to put the account in order.

Turning to the revenue account, the chairman said that they had a very substantial reduction in working expenses as a set-off against the smaller traffic receipts. That was partly due to the special provision made out of the income for 1924, and partly to the economies which had been effected. Referring to the omnibus and other road competition, Lord Aberconway said that assessments to local rates were continually increasing, and a part of the money paid in that way went towards the upkeep of the roads which their competitors were using. They found that their short distance traffic was shrinking in its proportions. The company had a Bill before Parliament which would provide for the extension of the electrified system into the country districts served by the railway. This would lead to the development of those districts, with a subsequent ever-increasing traffic. They would, however, not be in a position to contemplate further extensions north and west of Harrow until some alternative entrance had been provided to Baker Street, and the Circle lines, and the veritable bottle-neck that now existed on the City side of Finchley Road had been done away with. The company's proposal was to make a new railway leaving the present lines by a junction between Kilburn and Willesden Green, joining up with the Circle lines on the west side of their Edgware Road station. By this means a shorter and straighter route would be provided for fast trains, and new ground would be broken, as there would be three stations at convenient points on the Edgware Road, from which considerable traffic could be derived. The report and accounts were adopted.

Yorkshire Electric Power Co.

The annual meeting of this company was held at Leeds, on February 16th. Mr. A. G. Lupton (chairman), who presided, in presenting the report and accounts (Elec. Rev., February 12th, p 266) said that steady progress had been made during the past year, and the additional connections to the company's system were larger than in the preceding year. The recent fall in the cost of coal had enabled them to reduce their charges to consumers. The extensions at the Thornhill power station were completed, and the installation of a further 20,000-kW set had been sanctioned. The construction of the Ferrybridge station had proceeded during the year, and a limited supply was made available in January last. The chairman then reviewed the situation of the company under the Electricity Supply Acts, and stated that the proposal to cut the area of the company into two main portions, had had to be abandoned. This had led to considerable delay in the construction of the Ferrybridge station, and the board had finally decided that further attempts to carry out a scheme for a joint electricity authority could be of no avail, and that the company must proceed with the development of its area on the lines laid down by the Yorkshire Electric Power Act. The Distribution Company's activities, like those of the Power Co. had been checked while the Commissioners were considering the reorganisation schemes. The Distribution Co. had asked for orders permitting it to distribute in practically all the unprovided districts in the Power Co.'s area, but these had not yet been obtained. It was the original purpose of the company to provide electricity on a large scale, to enable small unprofitable stations to be closed down. Very considerable progress had been made, and a number of small stations had been closed down, and supplies were being taken from the Power Co. These had enabled the local authorities to materially reduce the price of electricity. When the Ferrybridge station was running, in the course of next summer, the company would have a total generating capacity of 93,500 kW in its three stations. In addition it would have completed some 50 miles of e.h.p. lines and 700 miles of distributing mains. The company had 340 sub-stations in operation, and in addition to supplying collieries, textile mills, engineering works, &c., the number of distributing undertakings associated with the company was 57. There was a constantly increasing demand from local authorities. The standards of pressure and frequency set by the company in 1901 were the accepted standards for the country, and new undertakings in the company's area had adopted them while old undertakings were gradually converting to them at their own cost. The area of the Yorkshire Power Co. adjoined that of other companies, which also supplied electricity at one standard frequency. The prospects of co-operation had not been overlooked, and when the need arose it could be effected without the establishment of any new organisation. He (the chairman) could not believe that any necessity existed for interfering with the development of supply on the lines which the company had followed for so many years. The opposition which the company had met in the past, from the large municipalities, was changing to a more cordial relationship, and in a few years all outstanding difficulties should be removed, and complete co-operation established. Referring to Mr. Baldwin's electricity proposals, Mr. Lupton said that at present the company could only supply electricity for power purposes. It could not light a person's house, even though the mains ran past his door. The removal of this disability would do much to speed up the use of electricity. Mr. Baldwin's scheme suggested the establishment of a small body to deal with the electrical needs of the country as a whole; he could hardly conceive that such a body would be able to know the needs of the different industrial areas so well as the various boards of directors and power companies which were serving them. Turning to the company's capital, the chairman said that an issue of 500,000 £1 ordinary shares was made last February, and the whole of this was taken up by the shareholders. At last year's meeting, authority was given for the issue of £773,000 of new capital. The directors now proposed to issue 765,000 £1 6 per cent. preference shares to the present holders of ordinary and preference shares. Further capital would be required, and it was proposed to apply to Parliament for an increase in the share capital of the company, to six millions. The report and accounts were adopted, and at a subsequent extraordinary meeting resolutions were passed approving of the application to Parliament for an increase in the company's capital, and sanctioning the donation of £5,000 to the Leeds University Fund.

Tottenham District Light, Heat and Power Co., Ltd.

The annual meeting was held on February 16th under the chairmanship of Mr. H. Woodall. In presenting the report and accounts, the chairman referred to the death of Mr. H. D. Ellis and the appointment of Mr. T. Goulden to fill the vacancy upon the board. Referring to the Government's electricity scheme, Mr. Woodall said that, while he viewed with alarm any incursion of Government into industry, which was much better left in private hands, he recognised that public service companies must be controlled, and the gas legislation had been, on the whole, a model of what such control should be. Coal should be carefully conserved, and it should be remembered that while 80 per cent. of the heat content was recovered in gasworks, in the generation of electricity only 20 per cent. was recovered. There were well-known authorities on electrical matters who were not satisfied as to the advantages of the Government's Electricity Bill. Any powers needed for the cheaper and better production and distribution of electricity could be obtained in the ordinary way, by application to Parliament. The Government proposals were "boosting" the electrical industry, which could be trusted to "boost" itself, with the result that it and allied industries were receiving a valuable advertisement. The electrical industry had been described as one of the bright spots in an otherwise dark picture. It was true that the electrical industry was prosperous, but from a national point of view it would be more true to say that the gas industry was the brighter spot in the picture. The electrical industry was paying large dividends and using coal extravagantly, while the gas industry was paying small dividends, using coal to much greater advantage, and had many schemes for the welfare of its workers, which, he believed, had no counterpart in the electrical industry. In the model Gas Bill discounts were limited to 25 per cent., whereas electricity was charged for, for one purpose, at as much as 10 times the rate as for another in the same dwelling. He thought that the general public would be better served if the price of lighting was considerably reduced even if the price for heating and power was raised. Large users of power could always generate electricity for themselves at a lower price than it could be distributed to them.

Prospectus.

London Power Company Ltd.—The list of applications was to close on or before yesterday, Thursday, in an issue of £3,000,000 five per cent. redeemable debenture stock at £96 per cent. In actual fact, however, so swift was the response, that it closed on Monday a few hours after publication. The company was formed in 1920 as a private company, under the name of the London Electricity Joint Committee (1920) Ltd., to secure the co-operation of the London electricity supply companies in the promotion of a scheme for the better development of the supply of electricity in London and Middlesex, and neighbouring districts. The company became a public company and changed its name on the passing of the London Electricity (No. 2) Act, 1925, and under contracts scheduled to and confirmed by that Act and made with ten London electricity supply companies represented on the board, it has agreed to purchase the freehold of the Willesden and Amberley Road generating stations, and certain transmission lines of the Metropolitan Electric Supply Co., Ltd., and to take on lease the generating stations and main transmission lines of the other constituent companies on terms under which such stations and lines will be acquired by the company on or be-

fore August 25th., 1971. The Act empowers the company by agreement with any constituent company to acquire its station and lines at any earlier date.

The company will operate the generating stations taken over and will supply the constituent companies with the energy required for the purposes of their businesses. Nine of the ten constituent companies have (subject to certain existing contracts for bulk supply) bound themselves by the contracts ratified by the Act of 1925 to take from the company all the electricity they require for supply by them until 1971. The other company (The Metropolitan Electric Supply Co., Ltd.) has bound itself to take from the company for at least ten years all the electricity it may require for its London area of supply.

Each of the ten constituent companies has by such contracts further agreed with the company that if in any year the receipts of the company on revenue account are insufficient to meet the charges payable therefrom (which include interest on the debenture stock and contributions to the sinking funds which the company is required by the Act to establish for amortisation of capital expenditure), such constituent company will provide a part of the deficiency equal to the proportion that the amount paid by it for electricity purchased by it during the year bears to the total amount paid for electricity supplied by the company during that year.

The aggregate number of kWh sold by the ten constituent companies during each of the last three years ended December 31st (excluding inter-company sales) has been as follows:—1923, 190,657,426; 1924, 215,952,957; 1925, 263,113,970.

The proceeds of the present issue are required to provide for the acquisition and extension of certain of the existing generating stations and main transmission lines and to pay off obligations of some of the constituent companies and for the general purposes authorised by the Act of 1925. The share capital of the company is £50,000, divided into 50,000 shares of £1 each, all of which has been issued at par for cash and is fully paid up, and is all held by the constituent companies. The holders of this capital have the exclusive right of nominating directors of the company. Preferential consideration was to be given to applications from debenture holders and shareholders of the ten constituent companies, the representative of which are stated below:—

W. F. Fladgate, M.V.O., Charing Cross Electricity Supply Co., Ltd.
H. R. Beeton, Brompton and Kensington Electricity Supply Co., Ltd.
R. H. Benson, London Electric Supply Corporation, Ltd.
W. R. Davies, Chelsea Electricity Supply Co., Ltd.
A. E. Franklin, Notting Hill Electric Lighting Co., Ltd.
W. Leaf, Central Electric Supply Co., Ltd.
A. W. Tait, C.B.E., Metropolitan Electric Supply Co., Ltd.
F. J. Walker, St. James' and Pall Mall Electric Light Co., Ltd.
Lord Wargrave, Westminster Electric Supply Corporation, Ltd.
C. C. Wyllie, Kensington and Knightsbridge Electric Lighting Co., Ltd.

The engineers are: Sir Alexander Kennedy and Mr. G. W. Partridge.

Northampton Electric Light and Power Co., Ltd.

The annual meeting was held on February 18th. Mr. A. H. Geldart (deputy chairman) presided, and in presenting the report and accounts (*vide* our last issue, p. 305), said that in spite of a very small increase in the demand from Northampton's staple trade, the energy sold had risen by 21.7 per cent., and although prices had been reduced, the revenue had exceeded the estimates. The greater output had led to a reduction in the working costs per kWh generated. The shareholders were to be asked to agree to the extension of the capital to £500,000. The programme for the ensuing year included extensions to Towcester, Bletchley and Fenny Stratford, and the completion of the ring mains to Daventry and Wolverton back to Northampton. An extension of 8,000 kW was being made at the Hardingstone Junction power station to cope with the demand. The report was adopted.

At a subsequent meeting a resolution was put forward to empower the board to issue 150,000 additional £1 "B" shares. The chairman said that only £60,000 of this would be issued at present—at the price of 28s. per share—to existing shareholders. It was suggested that the price should be 26s., but the chairman would not accept the amendment. Eventually the resolution was lost, on a show of hands, by a large majority.

Dublin United (Electric) Tramways Co., Ltd.

Mr. Joseph Mooney, chairman, presided at the recent annual meeting, when the report and statement of accounts were adopted and a dividend of 5½ per cent. was declared. The number of passengers carried in 1925 showed a slight increase as compared with 1924, but the revenue from this source decreased, which was attributable to the higher percentage of short-distance passengers. There was a decrease in revenue in the second half of the year which, the chairman said, was believed to be due to a decrease in the spending power of the travelling public. The new motor-'bus services to outlying districts were successful; more 'buses were nearing completion, and it was hoped to open up more routes soon.

Mr. Mooney alluded to the increase in traffic wages, which, he observed, pressed heavily on their resources. There had been some relief under the head of rates for the year, and they looked forward hopefully to a further reduction in these charges. As to the taking over of the Lucan Electric Railway by the company and the extension of their line through the Liffey Valley, terms had been arranged with the Dublin authorities and some of the townships whereby the period of tenure was extended; some townships, however, had not yet come to a decision.

North Metropolitan Electric Power Supply Co.

The report for the year ended December 31st last, records a net revenue of £315,292 (as compared with £272,483 in 1924). The addition of £7,297 brought forward gives an available balance of £322,589. Mortgage, debenture stock interest, &c., is paid, and £150,000 is transferred to reserve, leaving £125,452, which is allocated as follows:—Dividend on the two classes of preference shares, £55,999; final dividend on the ordinary shares, making 10 per cent. for the year, £62,777; carried forward, £6,676. During the year the capital expenditure upon plant, machinery, and mains amounted to £345,123. Approximately 160 miles of trunk and distributing mains have been laid and 35 new sub-stations have been put into service. The company's system is being linked up with the Barking station of the County of London Electric Supply Co., Ltd., and has been connected with the Metropolitan Electric Supply Co., Ltd. Arrangements are being made for the erection of a new generating station at Brimsdown. A supply of electricity was commenced at Potters Bar, Totteridge, Goldings, Hertingfordbury, and Upshire. Charges for supply have been reduced in the majority of the company's districts, and to authorised distributors. The total amount of energy sold was 112 million kWh, as compared with 96½ millions in 1924, an increase of 16 per cent. The number of consumers supplied, directly or indirectly, at the end of the year was 56,500, as against 45,500—an increase of 23 per cent. New showrooms have been opened at Edgware, Harpenden and Southgate. The meeting was held on Tuesday last.

Tyneside Tramways and Tramroads Co.

The half-yearly meeting was held on February 16th. Mr. G. E. Henderson (chairman), in moving the adoption of the report, said there had not been any improvement in the shipbuilding, engineering, coal and other ancillary industries during the year, but rather the reverse, and as the tramways went through an area principally engaged in those industries, both their ordinary and workmen's traffic had been seriously affected by continued and increasing depression, which accounted for their diminished receipts. Their traffic receipts for the year amounted to £39,105, as against £43,343 for 1924, a decrease of £4,237. The passengers also showed a decrease of 366,582. During the year they had been able to reduce their working expenses by £2,410, so that the gross profit of £4,457 was only £1,753 less than that for 1924. They were not able to pay a dividend on the preference shares for the past year. During the year they had added to their reserve funds £1,650, but they had taken from that fund, so that it stood at £27,027, against £30,372 at the end of 1924.

Scottish Power Co., Ltd.

The net trading profits for 1925 of the undertakings owned and operated by this company amounted to £58,044, of which £10,000 was allocated to the reserves of these undertakings. The balance remaining after meeting expenses and adding £2,503 brought forward is £45,099. After defraying interest, preference dividends, &c., and placing £7,641 to reserve, a dividend at the rate of 8 per cent. is to be paid on the ordinary shares, and £2,702 is carried forward. Transmission and distribution cables have been considerably extended, and additional boiler plant has been installed. It is stated that the services now approach the limits of the company's area of supply. The shareholders may be asked during the current year to sanction an increase in the company's capital. Meeting: To-morrow (Saturday).

Midland Counties Electric Supply Co., Ltd.

The trading profits for 1925 of the companies owned and operated by this concern totalled £171,506, and the balance at credit of profit and loss (including £4,457 brought forward) is £146,727. After meeting debenture interest, interim preference dividend, &c., and transferring £15,000 to reserve, there remains £83,974. A dividend at the rate of 6 per cent. is proposed on the ordinary shares, leaving £4,732 to be carried forward. The company reports a satisfactory increase in the demand which has led to considerable capital expenditure that should be productive in the near future. The traction section failed to contribute in the aggregate to the trading profits. Meeting: March 1st.

Power Securities Corporation, Ltd.

The third annual meeting was held last week, Mr. G. Balfour, M.P., presiding. In the course of his speech, the chairman said that they had proceeded cautiously, and confined their attention to general engineering and electrical development work, and to financial and underwriting business connected with public utility undertakings and public authorities. The electricity supply business in this country had made rapid strides since it was freed from the distraction of legislative proposals, and money was freely found to keep pace with the demand. Referring to the Government's electricity proposals, Mr. Balfour said that he hoped that the Government would confine them to removing and not imposing restrictions. The existing undertakers should be assisted in developing their areas, and private enterprise should be attracted to areas not yet covered. Coming to the company's own affairs, the chairman said that further progress had been made in connection with the Grampian electricity scheme. For the purpose of consolidating the areas, they had acquired two small electricity

undertakings, and were negotiating for two larger undertakings in the area. The volume of work carried out by Balfour, Beattie & Co., Ltd., was well up to that of previous years. Among the contracts being carried out by them was the Lochaber scheme, which would probably continue for another two years. The company's investments stood at £846,793; of this 37 per cent. was invested in electricity supply and allied undertakings, 29½ per cent. in Balfour, Beattie and Co., about 17 per cent. in British Government securities, and 16½ per cent. in industrial securities. The year's gross profit was £96,412, and the net balance £77,965, plus the sum brought forward, making £86,523. £20,000 was transferred to reserve, and the ordinary shares received a dividend of 6½ per cent.

London Electric Supply Corporation, Ltd.

The report for the year ended December 31st last records a profit of £202,426, as compared with £164,863 in 1924. To this is added £32,285 from the last account, and from it is deducted interest of £5,704 on a temporary loan, making £229,007. After providing for interest and sinking fund, there is an available balance of £188,933, which is to be allocated as follows:—Preference dividend, £41,952; ordinary dividend (10 per cent. for the year), £49,950; to reserve, £30,000; to depreciation, £30,000; to contingencies, £5,000; carried forward, £32,031. The sales of energy rose from 61,809,968 kWh to 90,905,284 kWh—an increase of 47 per cent. The average receipts per kWh sold were reduced from 1.56d. to 1.22d. The report makes reference to the developments in connection with the reorganisation of London's electricity supply, and states that the directors are taking the necessary steps to carry out the arrangements embodied in the London Electricity (No. 2) Act, 1925. The meeting is to be held to-day (Friday).

Isle of Thanet Electric Supply Co., Ltd.

The revenue for the year ended December 31st last was £137,990, and the expenditure £85,739, leaving net revenue of £52,251. Debenture interest, &c., absorbs £15,000, and £20,000 is transferred to reserve, and interest of £1,201 and a balance brought forward of £1,403 are added, making a net available balance of £19,854. After paying the preference dividend and one of 2½ per cent. on the ordinary shares, a balance of £3,504 is to be carried forward. Over 750 new consumers were added during the year, and an additional 3,000-kW set was installed to meet the growing demand. To provide capital for cable extensions, &c., the shareholders are to be asked to approve of the increasing of the company's capital by £140,000; £72,000 of this is to be issued forthwith in the form of 6 per cent. cumulative preference shares, which will be offered to shareholders at par, in the proportion of one to five. Meeting: March 1st.

Smithfield Markets Electric Supply Co., Ltd.—The net profit for the past year was £7,670 (after providing for debenture interest, &c., and depreciation); £2,022 brought forward is added, making £9,693. A final dividend at the rate of 5 per cent. is recommended upon the ordinary shares, making 8 per cent. for the year; £2,500 is transferred to general reserve, and £2,393 is carried forward. The output showed a considerable improvement over that of 1924. The report refers to the death of Mr. J. Browne Martin, a director of the company since its inception; it is not proposed to fill the vacancy thus created. The meeting was to be held yesterday (Thursday).

Electrical Distribution of Yorkshire, Ltd.—The accounts for the past year show a net profit of £31,099. To this is added £10,838 brought forward, making £41,937. A dividend at the rate of 7 per cent., free of tax, is paid on the ordinary shares (3½ per cent. was paid in August last); £10,000 is transferred to reserve; and £14,114 is carried forward. A continuous and growing demand is reported, particularly for domestic use. Further Orders have been approved by local authorities, and await the Electricity Commissioners' decision. The issue of 250,000 ordinary shares made last year was considerably oversubscribed by existing shareholders. Meeting: March 2nd.

Stock Exchange Notices.—The undermentioned securities have been ordered to be officially quoted:—

Johnson & Phillips.—100,000 ordinary shares of £1 each, fully paid, Nos. 500,001 to 600,000.

Vickers.—12,315,483 ordinary shares of 6s. 8d. each, fully paid, Nos. 1 to 8,190,817 and 8,190,968 to 12,315,633.

General Electric Co.—30,000 ordinary shares of £1 each, fully paid, Nos. 2,111,976 to 2,141,975.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

General Electric Co.—30,000 ordinary shares of £1 each, fully paid, Nos. 2,111,976 to 2,141,975.

Yorkshire Electric Power Co.—765,000 new 6 per cent. cumulative preference shares of £1 each, issued at 21s., partly and fully paid, Nos. 838,001 to 1,603,000.

South Metropolitan Electric Light and Power Co., Ltd.—Final dividend of 10 per cent. on the ordinary shares, making 15 per cent., as in 1924.

Bournemouth and Poole Electricity Supply Co., Ltd.—Final dividend of 5½ per cent., making 10 per cent. for the year, on the ordinary shares, plus a bonus of 4 per cent., free of tax, as in 1924.

Richmond Electric Light and Power Co., Ltd.—A dividend of 10 per cent. has been declared on the old ordinary shares, as in 1924.

Companies to be Struck off the Register.—The names of the undermentioned companies will be struck off the Register at the expiration of three months, unless cause is shown to the contrary:—

Auto Electrical Services, Ltd.
Newcastle and Sunderland Oxy-Electric Welding and Metallurgical Co., Ltd.
Perak Hydro-Electric Power Syndicate, Ltd.
Triumph Electric Manufacturing Co., Ltd.
Vickers (France), Ltd.
World's Electric Co., Ltd.

Companies Struck off the Register.—The names of the undermentioned companies have been struck off the Register and they are thereby dissolved:—

Anode, Ltd.
Boulton Magnetos, Ltd.
British East African Power Development Co., Ltd.
Central Electric (Handsworth), Ltd.
Hightensite, Ltd.
Metallic Electrodes, Ltd.
Scott Electrical Co., Ltd.
Tredelect Dynamos, Ltd.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—To a net income of £39 954 is added £8,219 brought forward, making £48,173. A dividend of 5 per cent. is paid on the ordinary shares; £19,452 is placed to renewals, depreciation and reserve fund; the reinstatement of roads consequent upon the abandonment of tramway routes requires £9,000; and £574 is carried forward. Unrestricted omnibus competition has led to the discontinuance of services on certain routes, and motor 'buses have been substituted. Meeting: to-day (Friday).

Bruce Peebles & Co., Ltd.—The directors recommend the payment of the following dividends in respect of the past year:—On the preference shares, a dividend at the rate of 7½ per cent. per annum, for the half-year ended December 31st, and a further dividend of 2½ per cent. per annum, for the year ended December 31st; on the ordinary shares a dividend for the year at 10 per cent. per annum, together with a bonus of 5 per cent.

Chas. Clifford & Son, Ltd.—There was a net profit of £20,873 for the past year, and the addition of the balance brought forward makes available £50,536. After paying the preference dividend and a total dividend of 10 per cent., and a bonus of 5 per cent., both free of tax, on the ordinary shares, £47,159 is carried forward.

Chelsea Electricity Supply Co., Ltd.—The ordinary shares are to receive a final dividend at the rate of 15 per cent., making 12 per cent. for the year, as in 1924. £17,000 is allocated to depreciation; £15,000 to reserve; and £9,000 is carried forward.

Clontarf and Hill of Howth Tramroad Co.—The general meeting of this company was recently held in Dublin, under the chairmanship of Dr. W. Lombard Murphy. The report and statement of accounts were adopted, and a dividend of 3 per cent. was declared.

Aberdeen Suburban Tramways Co.—The profit for the half year ended January 31st last was £188. With the addition of the sum brought forward there is a balance of £3,318 to the credit of profit and loss account. Meeting: To-day (Friday).

Crossley Bros., Ltd.—The net profit for 1925 was £60,383, and the addition of £19,075 brought forward, makes £79,458 available. The final dividend is paid on the preference shares, and a balance of £51,220 is carried forward.

Barcelona Traction, Light and Power Co., Ltd.—The directors have declared a dividend of 1¾ per cent. upon the 7 per cent. non-cumulative participating preference shares.

Newcastle-upon-Tyne Electric Supply Co., Ltd.—Final dividend on the ordinary shares, making 7 per cent. for the year, as in 1924.

Direct West India Cable Co., Ltd.—The directors have declared an interim dividend at the rate of 10 per cent., free of tax.

Shawinigan Water and Power Co.—A dividend of $2 per share on the common stock has been declared.

Halifax and Bermudas Cable Co., Ltd.—An interim dividend at the rate of 10 per cent., free of tax, has been declared.

Pennsylvania Water and Power Co.—A dividend of $2 per share has been declared for the quarter ending March 31st.

Stocks and Shares.

MONDAY EVENING.

THE London electricity supply companies have nearly finished the tale of their dividend declarations in respect of the second half of last year, and the distributions in every case have been maintained at those of the previous rates. That is to say, the dividends for 1925 are unaltered from those of 1924, in the London companies. This, while it has created a mild degree of disappointment among people who hoped that the companies would do something dramatic in the way of dividend declarations on the eve of the change-over, is a policy that is claimed as sound by others who contend that the companies are well-advised to strengthen their cash resources at a time like the present.

The effect upon prices of the dividend announcements has been actually nil. The factor that influences quotations at the moment is what is likely to happen when the reorganisations of capital are completed. Nor do all proprietors feel thoroughly happy at the outlook which confronts them, and which, as we have previously observed, is likely to be no worse, to say the least of it, than that which has prevailed during the past few years.

In the circumstances it is natural to look for dullness in the prices of electricity supply shares. St. James's, however, have risen ⅛ to 16¼. Bromptons and Charing Cross are both 1/16 down. The rest of the London list is unchanged. Yorkshire Electrics at 29s. 6d. are quoted ex dividend. Midland Counties are 6d. higher at 24s. 3d. upon the company's report showing an increase in net profit of £18,800 to £142,000. The company has to pay this year on extra capital, but the dividend on the ordinary shares is maintained at 6 per cent., to which it was raised from 5½ per cent. paid in 1923. The issued capital in the latter year was £1,723,519, whereas now it is within a few pounds of 2½ millions sterling. In all companies of this kind the tendency must be, of course, for the capital accounts to expand. As previously mentioned, the shares of these undertakings are in request by people who, recognising the inevitable growth of the concerns, recognise also the likelihood of new issues of shares being made at prices that will provide, in one manner or another, a bonus to the proprietors. The Electrical Distribution of Yorkshire pays its usual dividend of £7 tax free, and the net profit of £31,000 is £5,400 better than that of 1924. The Oxford Electric dividend of 7 per cent. is a rise of 1 per cent. over the previous year's rate. The shares stand at 5¼.

The Metropolitan Electric Supply Co. is promoting a Parliamentary Bill which, if carried in its entirety, will give the company extremely wide powers. The assumption is, however, that the company has gone "all out" for everything, in the hope of getting at least part of its proposals granted. Considerable opposition is set down against the Bill.

The feature in the Home Railway market is the rise to 100 in Underground Electric Income Bonds. These have been in speculative-investment demand for some time past, and the rather disappointing results achieved by the Tubes, as shown by the reports out a week ago, have had no effect in stopping the absorption of these bonds, which are being picked up for American account as well as for local consumption. The company's £10 shares have recovered to 2⅜, and Central London assented ordinary is a little better on balance at 68 x.d. London and Suburban Traction preference strengthened to 5s., London United Tramway debenture remains unchanged at 45.

The Traffic Committee, according to Sir Henry Maybury, is unanimously of opinion that tramways form an essential form of transport in London. His remedy for the present congestion lies in co-ordination of all traffic services, to which end he contends that resources should be pooled. It is with this idea in their mind that speculators have recently been buying London Tramway issues in a manner which is reflected in the prices of London and Suburban preference, and London United Tramway debenture.

A further remarkable rise has occurred in the price of Brazilian Tractions. The price touched 100 before it reacted to 99. Canadian buying is still declared to be the inspiration for the virility of the market, and as we have mentioned on many previous occasions, the Canadian-American interest is declared to be eager to obtain control through purchases of the shares. A curious, slightly humorous, rise occurred in Monterey "C" debenture, the price going from 1-3 to 2-6. Anglo-Argentine Tramways preferences of both classes are a little easier. British Columbia preferred strengthened a trifle.

Wireless shares continue dull, Marconis going back to 23s. 9d., and Radio common to 8½. The latter company's preferred keep tolerably steady at 9⅜. On the other hand, Marconi Marines are better at 18s. 9d. Burndept preferred rose from 13s. 9d. to 15s. bid. Cable stocks are inclined to strengthen, and amongst telephones, Automatics went back to 52s., after being 53s.; they show a small rise on balance.

Iron and steel shares show a fair degree of firmness, the outstanding feature being a rise of 1/16 to 53s. 9d. in Babcock and Wilcox. It is thought that the company is likely to benefit, not only from the Government's proposal to extend electrical development throughout the country, but also from the latest move guaranteeing capital for extension of the Kentish coalfield, in which Dorman Long and Pearsons are intimately interested. The cable equipment shares have moved but little. Speculation in these is subsiding noticeably. Brush and Metropolitan-Vickers ordinary are down to the common level of 27s.; on the other hand, Siemens strengthened to 31s. 3d. Telegraph Constructions maintain their rise at 29.

The London Power Co. achieved immediate success with an offer of three million pounds 5 per cent. redeemable debenture stock. This was eagerly snapped up at 96. The security, backed as it is by ten of the leading electricity supply companies in London, can be regarded as first-class, and the stock is gilt edged. The principal is repayable at par in 1972. The stock will take rank as one of the best of its kind in the eye of the cautious investor who wants permanency as well as safety for his capital.

Rubber shares are a dull and dispirited market, owing to the price of the raw product, which dipped to 2s. 4¾d. per lb. The slump has frightened some of the more nervous amongst rubber shareholders, and the fall in prices, from the best levels reached, is now substantial.

Exports and Imports of Electrical Goods and Machinery in January, 1926.

THE export figures for January are not encouraging; there was a decline of £84,086 as compared with the previous month, while comparison with the corresponding period of last year shows a fall of £364,209. The decline from the December, 1924, total (£84,086) was mainly due to the decreased exports of unenumerated electrical machinery, while submarine telegraph and telephone cable also contributed to a large extent. The increases were greater in number but failed to compenstate for the fall in these two items. The seriousness of the decrease of over £364,000 from the January, 1924, figure is somewhat mitigated by the fact that £259,193 of it was due to a fall in the value of submarine cable exports; this, as we have previously observed, is an item subject to very violent fluctuations, rendering comparisons very difficult and often misleading. Apart from this, however, the decline was certainly a large one—in the neighbourhood of £100,000—and was attributable mainly to the decreased shipments of motors and generators and telegraph and telephone instruments and apparatus.

The fall in the import total, while numerically smaller than in the case of the exports, was proportionally larger, and was, moreover, a general decrease. Only three items rose, the principal increase occurring in telegraph and telephone wires and cable (not submarine). The most noticeable decline occurred in the item "batteries and accumulators," which, by the way, was accompanied by a rise in the exports of these articles. The fall in the imports of insulated wires and cables was also attended by a rise in the export section. In comparison with January, 1924, imports were down by £70,729, telegraph and telephone apparatus and batteries and accumulators being mainly responsible for this. There was a substantial increase in the importation of unenumerated electrical goods.

As compared with the preceding month, re-exports were uninteresting, but the total represented only two-thirds of that of January, 1924. The decrease was well distributed; only glow lamps and batteries and accumulators showed a rise.

An Extra-High-Pressure Cable.

Some Constructional Details and Test Results of the New Pirelli Cable.

THE rapid growth in the demand for electrical energy, and the concentration of generating plant in large power stations, has made the use of very high-pressure transmission lines a necessity. Hitherto, transmission at 11,000 and 22,000 volts has answered the purpose; 33,000 volts has now become standard practice, and many miles of underground cable are working satisfactorily at this pressure. It is, however, not sufficient for the transmission engineer, who sometimes requires voltages very much higher for his purpose; and in consequence pressures above 35,000 volts have had to be dealt with by overhead lines. The dangers and objections which beset overhead transmission, however, are many, but for the time being there is little or no alternative. The problems which confront cable makers in competing with overhead work are difficult, and considerable amounts of time and money are being spent in research work to develop cables of suitable design and construction to meet the situation. In the meantime the developments in connection with the new H.p. cable, made by Messrs. Pirelli, Milan, are being closely watched, and it is interesting to learn that the makers have built and installed underground cables which have been operating successfully for a considerable time on 3-phase systems, at pressures higher than 35,000 V. In Barcelona 6½ km of cable (19.5 km. of single core) is working at 50,000 volts, between phases. In the Gothard Tunnel, power at 60,000 volts single phase is carried over 22 miles of cable; and, as reported by Mr. Emanueli, at the "Conference Internationale des Grands Reseaux Electriques" in Paris, an experimental line of three single-core cables, each 600 metres long, has been laid in conjunction with an overhead line, and has been operating at 130,000 volts without interruption for the past two years. This cable was briefly described in the ELECTRICAL REVIEW, May 1st, 1925, and we have received from Messrs. Pirelli-General some further particulars concerning its construction.

There are several novel features in the design of this cable, many of which are covered by patent rights, and in some cases the processes used are not available for publication. The conductor is made hollow, as shown in fig. 1 (full size), and the necessary number of copper wires are laid up on the outer surface of a galvanised iron or h.d. copper spiral, which provides sufficient support to maintain the tubular formation, and at the same time, being elastic, is able to accommodate itself to movements due to handling.

The insulation is of paper and is applied in the usual manner, but it is graded, according to its permeability, so as to present a dielectric strength proportional to the pressure gradient at all points from the conductor to the lead covering. Graded paper insulation, as regards thickness of paper, has been used by manufacturers for some years past, but in 1919 Mr. Emanueli discovered that a relation existed between the porosity of the paper and its dielectric strength. Graduation, therefore, is determined not by the thickness of the paper, but by the degree of its permeability to fluid. This quality

is measured by means of a suitable apparatus, in which the paper to be tested is traversed under a certain pressure P by a fluid, which may be air, and then, by measuring the time t, required for a determined volume s of the fluid in question to penetrate the thickness of the paper, a coefficient A, strictly related to the permeability, can be obtained by a suitable manipulation of the quantities t, s and P, together with the coefficient of viscosity n of the fluid, $A=f(t, s, P, n)$.

Fig. 1.—Section of e.h.p. Cable.

The dielectric strength may be determined by any of the well-known means.

The principal conclusion drawn from researches made in this direction is that, the impregnating compound being constant, the dielectric strength is, up to a certain point, greatest in the least permeable paper. For example, a paper of A = 50,000 dried and impregnated is perforated at 15,000 volts/mm., whereas a paper of A=370,000, similarly treated, requires a pressure of 37,000 volts/mm., before it can be perforated. However, no further increase of dielectric strength is obtained with papers of a higher A (see fig. 2). In order, therefore, to obtain a high resistance to perforation in cables for conveying very high-pressure electrical energy it would be necessary to use only paper possessing a very high degree of impermeability, or at least not below a certain limit (A = 400,000).

Layers of highly impervious paper (50 kV/mm.) are applied next to the conductor—and it would appear to be an extremely simple matter to build very high-pressure cables by continuing the use of this paper throughout, but practical difficulties arise, as the density of this paper prevents the thorough impregnation of the core, consequently successive outer layers are composed of papers of gradually decreasing density—that next to the lead having a dielectric strength of 30 kV/mm. The highest stresses are, therefore, met by the insulation of greatest density, and the lower stresses by insulation of corresponding lesser densities. In this way highly efficient insulation is obtained, and the over-all diameter of the cable reduced, without, however, in any way reducing its factor of safety. The very unusual practice is adopted of lead-covering this type of cable before, instead of after, drying and impregnating. Dry air is passed through the hollow centre, and by application of electrical tests the process of drying is watched throughout, and the required result obtained with certainty. Impregnation also takes place from the centre of the cable, to which a vacuum is directly applied. Better results are found to be secured by producing, within the cable itself, a higher degree of vacuum than can be obtained when employing the usual method of tank impregnation.

In the installation of this cable the central cavity is maintained through the joints. At the terminal ends and intermediate points it is connected with tanks placed at suitable heights, and the whole is filled with a light insulating oil. By this means oil is kept in the hollow core under pressure and in immediate contact with the insulation throughout the whole length of the cable, and expansion and contraction of the oil, due to temperature rise or fall, is accommodated in the reservoirs.

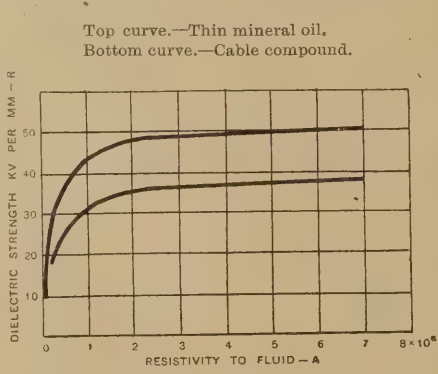

Fig. 2.—Dielectric Strength and Resistivity.

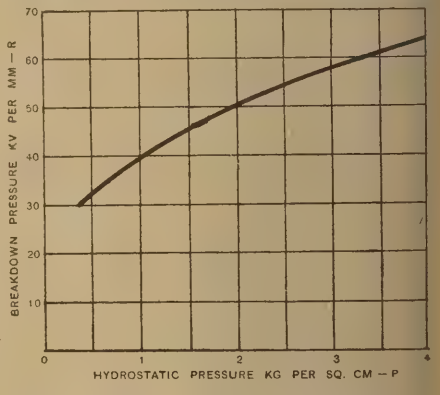

Fig. 3.—Dielectric Strength and Fluid Pressure.

It is interesting to note the effect of increasing the pressure on the dielectric strength of the cable paper impregnated with this thin oil. Fig. 3 shows that an increase of pressure from 1 to 4 kg./cm.² is sufficient to double the breakdown voltage.

This design overcomes many of the difficulties that are met with in the usual form of cable; the use of three separate lead-covered cores eliminates the dangers set up by tangential stresses which assume serious proportions in very high-pressure 3-phase cables. The hollow construction, and the use of the thin oil, ensure that the cable is full of oil at all conditions of load; the expansion tanks supply oil when required, or receive excess oil and store it, to suit the changing conditions. Thus no voids or gas spaces are formed in the cable, and no deterioration takes place.

The joints are made by using a copper tube, upon which the conductor wires are laid and soldered, thus maintaining the tubular passage. The insulation of the cable, having been tapered down from the lead to the conductor (the tapered portion extending over a considerable length on both sides of the joint), is built up with strips of impregnated paper. Here, as at the terminals, the perfect impregnation which is obtained, due to the hollow design, considerably assists in eliminating the serious disadvantages which arise from the presence of gas pockets; consequently the over-all diameter of the joint is little more than that of the cable itself. To prevent the joint absorbing moisture whilst the insulating tape is being applied, hot dry air is blown on the joint during the whole of the process. The joint is then impregnated, and to ensure this being thoroughly done, a vacuum is produced in the hollow centre of the cable, and sufficient current passed through the conductor to warm up the cable, and to make the compound more fluid to penetrate the insulation and to drive out all traces of humidity. The insulation over the joint is then covered with metal foil, contact being made with the lead sheath on both sides, in order that the stresses due to the sheathing may be continued, without interruption, throughout the length of the cable. At the terminals the lead sheath is bell-mouthed to a specified shape, so that the stresses parallel with the paper insulation are constant from the point where the sheath ceases to be in contact with the insulation to that where the insulating material increases in thickness.

These cables are laid direct in a trench, approximately 30 in. deep by 20 in. wide. They are, of course, unarmoured, but the lead sheaths are protected by layers of suitable waterproofing material. They are laid with 6 in. between centres, separated from each other by a line of bricks, and protected by brick covers. All the sections constituting the line in Italy were tested before leaving the works, with 150,000 volts for 15 minutes, then with 175,000 volts and 200,000 volts for one minute. A short length was tested with 275,000 volts for two minutes, and then 150,000 volts for 24 hours, without sign of hot spots. When the cable was laid, jointed and connected to its special terminal ends, the system was tested up to 180,000 volts, 3-phase, this being the highest available pressure. Dielectric loss/voltage (fig. 4) and dielectric loss/temperature curves (fig. 5) show the remarkably good results obtained with this method of construction.

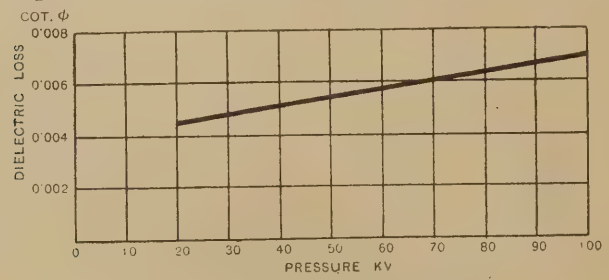

Fig. 4.—Dielectric Loss and Pressure.

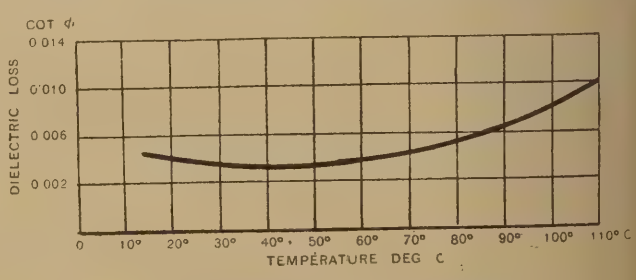

Fig. 5.—Dielectric Loss and Temperature.

It will be recalled that a special design of pothead is used for terminating this cable, and the construction of it was described and ilustrated in the issue of the ELECTRICAL REVIEW already referred to.

It is interesting to note that the N.Y. Edison Co. has ordered a cable of the above type for 132,000-V transmission, and that a similar cable for 140,000-V working is to be supplied to Chicago.

The London Telephone Service.

Developments and Progress during the Year 1925.

A STATEMENT of progress in 1925, signed by Mr. W. A. Valentine, controller of the London telephone service, and Mr. R. McIlroy, superintending engineer of the London Engineering District, shows that the London telephone area covers approximately 750 sq. miles, and extends from Reigate in the south to Waltham Cross in the north, and from Tilbury in the east to Hayes in the west. The requirements of this area are at present met by 107 exchanges, including the trunk (long-distance) exchange, which handles traffic to the more distant provincial exchanges, the Irish Free State, and the Continent, and the toll exchange, which deals with traffic to the nearer provincial exchanges. They vary in size from 100 to 10,000 lines, and the number of exchange lines connected at the end of 1924 was 244,342; at the end of 1925 the net increase was 25,459, or about 10.4 per cent.

There is an increasing demand for private wires; the increase during the year was 1,200, and the total number is now 15,000. The total number of telephones (exchange and private) at the end of 1925 was 476,813, a net increase of 37,590. Private branch exchanges (p.b.x.) total 21,000; of this number, 62 are automatic. At the request of subscribers, approximately 28,000 removals and alteration of apparatus were effected. Call offices working at the end of 1925 numbered 4,403, the increase for the year being 260. Kiosks, at which a day and night service is provided in the streets, numbered 212. Multi-coin boxes for call offices, which permit the use of shillings and sixpences for long-distance calls, as well as pence for short-distance calls, meet the public need, and extensive development is contemplated.

Four new exchanges were opened to serve new areas, Albert Dock, Franklin, Mill Hill, and Sloane, providing an increased capacity of 5,600 lines. Six new exchanges were provided to replace exchanges already existing at Enfield, Grangewood (formerly East Ham), Malden, Palmer's Green, Pinner, and Tilbury; in addition, the equipment of 47 existing exchanges was extended and provide (with the new exchanges mentioned) additional capacity of approximately 24,000 lines. Work in hand includes ten new exchanges and the extension of 27 existing exchanges, to provide increased capacity of 36,440 lines; new exchanges and extensions projected for the present year will provide a further 30,000 lines. If the anticipated rate of telephone growth is maintained, it will be necessary during the next eight years to open 71 automatic exchanges within 10 miles from Oxford Circus and 33 manual exchanges outside that radius, but within the London Telephone area, which will provide for the replacement of worn-out plant as well as for growth.

During the past year an extension of the toll exchange was completed, increasing its capacity by 25 per cent. A new toll exchange of approximately twice the capacity of the present exchange, and designed to work in conjunction with it, is expected to be completed in 1926. New underground cable has been provided between London and Glasgow, and five new direct lines have been brought into use between these cities. Work has commenced on additional cables to carry trunk and toll circuits from London to Farningham, Tonbridge, Sutton, Stanmore, Leatherhead, Cambridge, and Derby, most of which cables have been brought into use. There are 14 new exchange buildings under construction, and sites for 21 additional exchanges have been secured, but considerable difficulty is experienced in acquiring sites for exchanges in suitable situations.

There has been a rapid increase of line plant during the year: The total mileage of single wire provided for subscribers' lines and local junctions is now 1,800,000, an increase during the year of 131,000 miles; the total mileage on December 1st, 1918, was 1,100,000. The great majority are underground, of which there are 7,000 miles, each cable containing from 20 to 2,000 wires; the weight of copper in these cables is over 10,000 tons, and 40,000 tons of lead has been used to sheath them. Earthenware ducts and iron pipes increased during the year by 693 miles to 6,450 miles. The total length of pole line in London is 5,280 miles, and the mileage of single wire carried on them is 63,294. The amount of "open" wire shows a tendency to decrease, as the increasing telephone density in some areas renders it economical to use underground cables. In some of the more important streets in the City area it has been necessary to resort to tunnelling. The automatic installations in hand represent a capacity of about 45,000 lines, and those projected about 147,000 lines—about 192,000 lines in all in the section of the automatic programme which has been commenced. Progress has been made with the "tandem" exchange, the purpose of which is to facilitate calls to and from subscribers connected to exchanges between which there is not sufficient traffic to justify the provision of direct groups of junctions; about 8,800 junction lines will be connected to the tanden exchange.

During the year the largest private automatic branch exchange in the country (that serving the Port of London Authority and its various sub-departments) was opened. Automatic exchanges have also been provided at the following docks:—London and St. Katherine, India and Millwall, Victoria and Albert, Surrey Commercial, and Tilbury; the initial equipment caters for 740 extensions, but provision has been made for extension to 1,370 ultimately. During 1925 orders were taken for 26 private automatic branch exchanges, as compared with a total of 52 such orders in the preceding three years.

At present London subscribers originate, on the average, 1,667,000 calls per working day, or about 478,600,000 calls per year, an increase of about 7.5 per cent. as compared with the previous year; of the average daily traffic, about 256,000 calls are made during the busy hour of the morning, so that about 15 per cent. of the 24 hours' traffic is handled in a single hour. Day and night service is given at all exchanges, and on the average about 61,000 calls are originated daily between 8 p.m. and 8 a.m. About 80 per cent. of the total calls originated are made to subscribers on other exchanges, and to accommodate this inter-exchange traffic over 29,000 junction lines have been provided, an increase of about 9 per cent. on last year's total. The number of calls outgoing from London daily at the trunk and toll exchanges is about 26,500, an increase of about 7.2 per cent. over the preceding 12 months.

For the Anglo-Continental traffic, additional lines have been provided to Amsterdam and Rotterdam, and the traffic has risen appreciably. The service is available between all British and Dutch exchanges; there is also direct service to Antwerp, Brussels, and Ostend open to all Belgian towns. Taking the Continental traffic as a whole, 50 per cent. is to France, 24 per cent. to Holland, 21 per cent. to Belgium, and 5 per cent. to Switzerland.

The Phonogram room at the Central Telegraph Office, for the reception and transmission of telegraph messages direct from and to telephone subscribers, has 380 junction circuits to 68 telephone exchanges in the London area, while facilities have been provided for the employment of 220 telephonists to receive and transmit telegraph messages, and an extension to accommodate an additional staff of 72 is now in hand. The number of phonograms dealt with during 1925 was 1,423,781, the increase being about 12.3 per cent. From the public point of view the phonogram service is rapidly increasing in attractiveness. On Christmas Eve no fewer than 19,000 telegrams were forwarded and received by telephone.

The operating staff employed in the exchanges of the London telephone service numbers about 8,200 telephonists and supervisors. Over 1,200 new entrants to the service passed through the Clerkenwell operating school during the year and, in addition, seventy telephonists employed by subscribers for their private branch exchange work were trained in standard methods of operating. Eight telephone officials from other countries visited the school to study the methods employed in training the staff. Over 70,000 engineering workmen are employed, about two-thirds of them on construction and development work and the remainder on maintenance.

The operating of over 100,000 calls was observed, and statistics indicate that the average time of answer to the subscribers' calling signals for the year was 5.4 seconds, 89.4 per cent. of the calls being answered within 10 seconds, or less. Complaints from subscribers regarding local call charges are decreasing. The electrophone exchange was closed on June 30th, 1925. The number of subscribers reached 2,080 in January, 1923, but the introduction of wireless broadcasting resulted in a gradual diminution. At the G.P.O. South, apparatus is to be used for amplifying speech received over long trunk lines, and a set already installed has given satisfactory results. The introduction of this apparatus will appreciably extend the range of speech, as the attenuation due to the use of long lines can be corrected by means of valve amplifiers.

The City Smoke Problem.—In an address delivered before the Circle of Scientific, Technical and Trade Journalists, on February 16th, Dr. John S. Owens, B.A., A.M.Inst.C.E., pointed out that the pollution of the air by smoke resulting from the growth in size of cities had grown so gradually that the magnitude of the evil was not fully recognised. He divided the problem of obtaining clean air into two parts: First, the production of an active desire on the part of the community to keep the air clean; without this, the second, or technical, part of the problem, namely, the finding of the means, would not be likely to be solved. The smoke problem was essentially a public one; the evil effects were rarely felt by the smoke producer himself, but by his neighbours. The contrast between the care taken to keep water and food supplies pure and unpolluted and the little attention given to the provision of pure air was indicated; the economic cost to the country was also mentioned, and it was stated that smoke cost, in London, about 24s. per head of the population per annum, when all its effects were taken into account. In Manchester the cost was about 30s. per head, and in other cities it was doubtless much higher. There was thus a colossal waste which was largely avoidable. The keynote of Dr. Owen's address was the part the Press had to play in bringing about improvement, by removing the public apathy and producing a desire for such improvement, without which there would be little progress.

The Electric Propulsion of Ships.

Some Details of the Equipment of a 17,000-h.p. Twin-screw Liner.

(*Abstract of Paper read before the* North-East Coast Institution of Engineers and Shipbuilders.)

At a well-attended meeting of the N.E. Coast Institution at Newcastle-on-Tyne recently a paper on the above-named subject was read by Mr. W. J. Belsey (of the British Thomson-Houston Co., Ltd.), in the absence of its author (Mr. Eskil Berg, of the General Electric Co., of America). Sir William J. Noble, past president, occupied the chair, and the reading of the paper, which is abstracted below, was followed by a discussion.

The paper contends that the electric propulsion of ships can no longer be considered in the experimental stage. Its use by the United States Navy during the last ten years, and its application to a few rather large cargo steamers as well as several other types of ships, have proved this method successful, reliable, economical, and the upkeep of the electrical apparatus has been practically nil.

For large powers where steam is considered, the steam turbine must be used on account of its high efficiency, as compared with any other steam prime mover; in order to obtain the best efficiency, the machine must be designed for relatively high speed (r.p.m.), which makes it necessary to interpose either mechanical speed reduction or electrical transmission between the turbine and propeller shafts. Mechanical gears for large powers require a multitude of turbines and pinions, complicated steam piping and cross-over connections between the various turbines, as well as a multitude of turbine gland packings. Reversing turbines are a source of great loss, not only friction loss, but, as they necessarily make the turbine longer (which makes the distance between bearings greater) a larger diameter shaft for the same deflection is involved, thus increasing the packing losses as well as bearing losses. With mechanical gears, the turbines adopted have generally to be of lower speed (r.p.m.) than that which would give the most economical design for the horse-power required. This item is important, as, in almost every case, the lower-speed turbine with the features mentioned above will involve a loss in turbine economy that is a great deal more than the total electrical transmission loss; in some cases, it may be more than double the electrical losses.

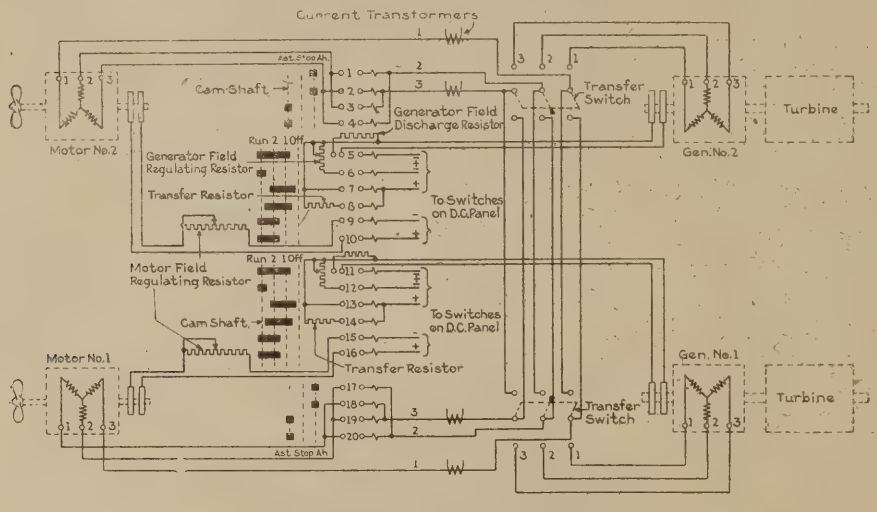

Fig. 1.—Diagram of Electrical Connections.

In electric ships full advantage can always be taken of new improvements in turbine design which develop in the enormous field of turbo-generators for central station use; in other words, the very latest turbine designs can always be used. The enormous advantage in economy by the use of high steam pressure, steam temperature, steam extraction for heating boiler feed water, &c., can be secured in the electric ship without any complication and with practically no special divergence from standard modern steam station practice. Many stations are successfully using 550 lb. boiler pressure and a steam temperature of 725 deg., which produce 1 kWh at the switchboard with about one pound of coal of 14,500 B.th.u. This is not a record of a few hours' operation, but is a weekly record, and includes the whole power plant, taking into consideration load factor, cleaning boilers, &c. What this means on board ship may be illustrated by the fact that a large luxurious liner using 50,000 h.p. can be operated with a total fuel consumption of less than 300 tons of fuel oil per day, including everything on board the ship.

Recently the International Mercantile Marine has closed a contract with the Newport News Shipbuilding Co. for an electrically-driven, twin-screw, passenger-cargo liner having 17,000 h.p. The propelling machinery is to be built by the General Electric Co. of the United States of America, and the dimensions and particulars of the ships will be as follows:—Length, 600 ft.; beam, 80 ft.; draught, 30 ft.; displacement, 22,000 tons; propeller speed, 120 r.p.m.; horse-power, 17,000; speed, 18 knots; propellers, 18 ft. 6 in. in diameter, 17 ft. 3 in. pitch. The steam pressure at the throttle will be 250 lb.; superheat at throttle, 100 deg. F.; vacuum, 28½ in. The 12 Babcock & Wilcox oil-burning marine boilers will have each 4,600 sq. ft. of heating surface and 1,344 sq. ft. of superheating surface. The two turbine-driven alternating-current generators will have a rating of ATB 2—6,600 kW, 2,888 r.p.m., 4,000 volts. The two main synchronous induction motors for direct connection to the propeller shafts will have a rating ATI 48—6,600 kW, 120 r.p.m., 4,000 volts. There will also be four 500-kW direct-current generating sets.

In this case no attempt has been made to reduce the weight of the apparatus from that used for land purposes:—

The weight of the two turbo-generators, including all accessories, tools, &c., will be ...	306,000 lb.
The two main propelling motors will weigh ...	338,000 lb.
Complete control equipment, including cables	17,000 lb.
Total ...	661,000 lb.

Weight per shaft horse-power, 39 lb.

Electric propelling machinery has also been laid out for a light cruiser having 120,000 h.p. In this case the weight is of the greatest importance and the equipment would weigh 18 lb. per shaft horse-power.

The price of the electrical propelling equipment complete in this case is substantially the same as the geared-turbine equipment proposed for this ship, but on account of simplier and less costly foundations, piping, oiling system, &c., it was found to be cheaper than any other method of propulsion proposed.

The control apparatus will consist of contactors for closing the electrical circuits between the generators and motors; it will be operated by means of four levers (two for each motor). In addition, there will be two small levers for regulating the speed of the main turbines. The two main levers for each propulsion motor will consist of: One for regulation the excitation of the generator and the motor; the other is the reversing lever, which will have three positions, "ahead," stop," "astern." The field lever will have four definite positions, "off," "1," "2," "Run." On position "1" double excitation will be applied to the generator alone; in this position, with the reverse lever on either "ahead" or "astern," the propelling motor will be started or reversed as a pure squirrel-cage induction motor. In position "2" normal excitation will be applied to the rotor field, leaving double excitation on the generator; in this position the motor will phase in and become a synchronous motor. Position "run" reduces the excitation of the generator to normal.

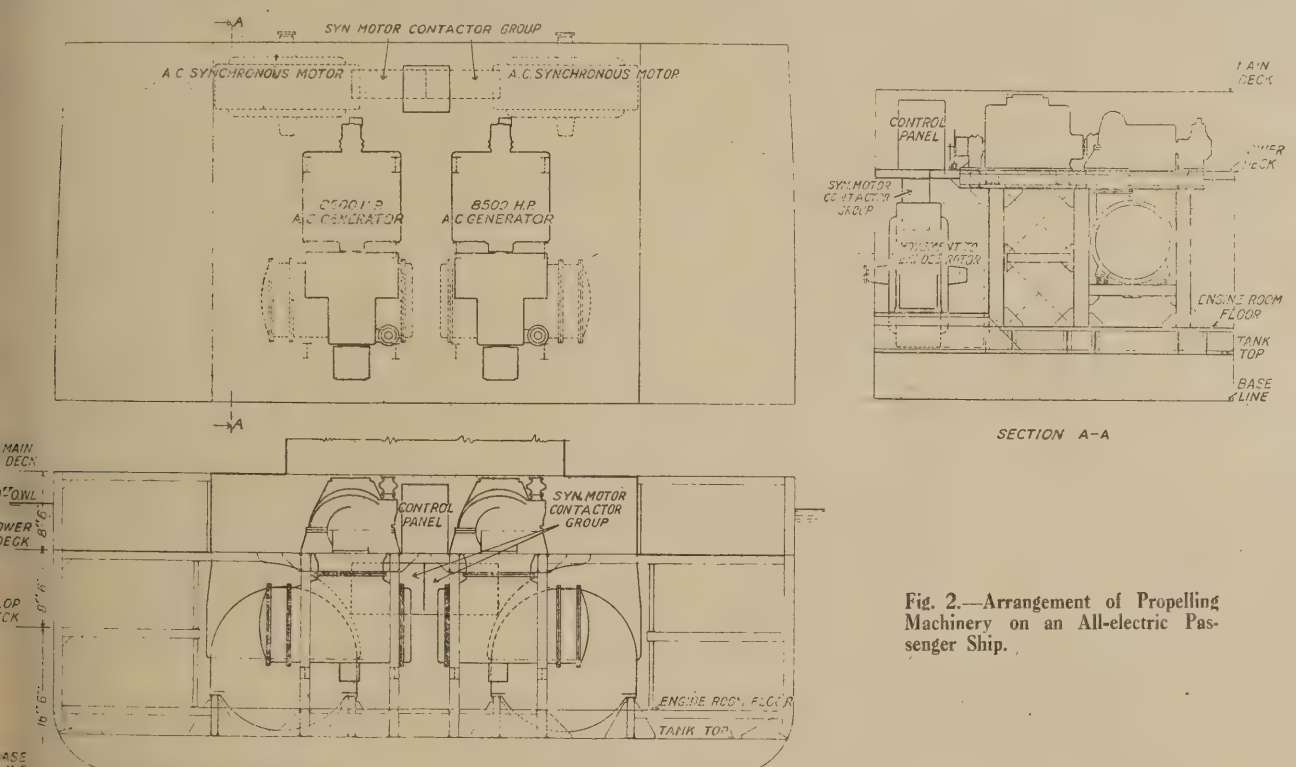
Speed variation of the propeller revolutions in either direction will be obtained by varying the turbine speed, controlled by the operator from the small lever on the control board. Normally both turbo-generators will be in operation. Should, however, it be desired at any time to operate the ship at three-fourths speed (or lower) for a considerable length of time, only one generating unit need be used and both propelling motors can be operated from the control board exactly in the same way as when both units are running. This feature should prove most economical should the ship be used for cruises during the slack season, as in this case almost 15 knots can be obtained.

The motors and the generators are designed to give the necessary torque to reverse the propellers from 120 r.p.m. ahead to 120 astern in 20 seconds; quicker reversal can be had, but is not considered advisable. Fig. 1 is a diagram of connections of the electrical circuits and fig. 2 shows the arrangement of the machinery in the ship, but is subject to slight changes at the present time.

The steam consumption per s.h.p. delivered to the propeller shaft (including all losses in generators, motors, cables, &c.), will be 9.5 lb. when delivering 17,000 h.p. to the propeller shaft at 120 r.p.m.; when delivering 13,500 h.p. at 110 r.p.m. under the same steam conditions the consumption will be 9.9 lb., and considerable margin is included in these figures to take care of sea conditions and inaccuracy of tests. If electrically-driven auxiliaries are used, the fuel consumption per s.h.p. hour, including everything on the ship, at 17,000 h.p., will be 0.85 lb., and at 13,500 h.p. 0.90 lb.; in these calculations slightly over 1,000 kW direct-current load has been assumed in both cases. This ship will be operated with only 100 deg. F. superheat. The design of the turbine is, however, made to use efficiently and safely 300 deg. should it at a later date be desired to increase the superheat, or if new additional ships

should be built. The fuel saving by going to 200 deg. over 100 deg. is 5 per cent. and to 300 deg. over 100 deg. is 9 per cent. Electric propulsion is particularly well adapted to high steam temperatures, as all the reversing is done electrically and no undue heat stresses, or temperature changes, take place in the turbine itself—as is the case when mechanical gears are used.

At 17,000 h.p. load and 120 r.p.m. of the propellers, the generator will have an efficiency of 96.75 per cent., excluding excitation which, in this case, will be 32 kilowatts per generator, or less than ½ per cent. The motors will have an efficiency of 97.5 per cent., excluding excitation, which amounts to 45 kW per motor, or 0.68 per cent. The loss in cables and control will amount to 0.04 per cent. The total transmission loss will be, therefore, excluding excitation, about 5.7 per cent., or, if excitation is included about 6.75 per cent.



At reduced speed of the vessel the efficiency of the generator and motors will remain practically constant, as the voltage is then reduced in about the proportion of the square root of the horse-power, so that at three-quarters speed the voltage is reduced from 4,000 to about 3,000 volts, and the transmission loss is only increased from 6.75 per cent. to 7.4 per cent., although the load is reduced from 17,000 h.p. to about 7,000 h.p. The loss in gear efficiency, under similar conditions, would be about 2 per cent.

The advantages of electrically driving a large liner are simple means of speed reduction between the turbine and propeller in almost any ratio which may be desired. It affords means of reversal by simple change of electrical connections, without changing the direction of rotation of the turbine. Any desired reversing torque up to the full power of the turbine can be obtained without affecting the efficiency of the equipment in the forward direction. Reversal is obtained with a minimum amount of steam drawn from the boilers, as the full inertia of the turbo-generator is first used in the act of reversal; in fact, in most cases actual reversal is obtained without drawing any steam from the boilers, and steam is only used from the boilers to accelerate the propeller speed in reverse rotation. Electrically-driven vessels can be made noiseless.

Electric drive makes it possible to obtain accurate data, either by instantaneous readings, or by recording instruments, of the load on the propeller shaft under various conditions of sea and wind; to have a real check between fuel consumption and horse-power-hours developed means a constant check on economy. Maintenance experience with the electrically-driven ships by the General Electric Co. and the British Thomson-Houston Co. has shown that the upkeep of the electrical machinery has been practically nil so far.

The tendency lately is to put some of the large and medium size liners on winter, or other, cruises when the season is slack. With electric drive about three-quarters speed can be obtained by the use of only one of the two power units, which means a very large saving in fuel and attention; the steam consumption per s.h.p. will be practically the same as that at maximum speed. In the design of the generators and motors special precaution has been taken so that, should damage occur to any part of the windings, it can quickly be repaired, or temporary quick repairs can be made, so that the ship can proceed at slightly reduced speed. Multiple circuits are used in the generators and motors so that in many cases (for instance if a coil is damaged) it can simply be cut in two with a hack saw, the ends insulated, and the loss in power will be only the ratio of this one circuit to the total number of circuits in multiple; for instance, if the motor has 10 circuits in multiple, and one circuit is cut out, the power is reduced only 1/10th, which will be practically unnnoticed, and the repair should take only a few minutes. If several coils are damaged a jumper can be connected across the damaged coils and the vessel can proceed. Electrical repairs are always easily made when fully understood. Electric drive in many cases may afford important advantage because the generating unit, or units, can be placed in any convenient place near the boilers; they can be mounted at any height desired, the condensers can be put directly under the turbines, thus reducing the steam and the exhaust piping to a minimum. Chances of air leaks, which are so detrimental to obtaining good vacuum, are reduced to a minimum. The propelling motors can, in many instances, be put near to the propellers, eliminating long, expensive, shafting and the bearing losses incident thereto. Shaft alleys can be eliminated, thus saving hold space and making cargo handling much easier and convenient.

The turbine for electric transmission can be built more efficient; no reversing wheels are required, thus the turbine becomes shorter with a smaller shaft, less diaphragm packing leakage, packing and bearing losses. Since there is no heat distortion during reversal, smaller clearances can be used with the same factor of safety, all of which goes toward greater economy. Full advantage can be taken of the economy derived from high steam pressure and super-heat; as the turbine is never reversed, it cannot be subject to extreme temperature changes.

SECTION A-A

Fig. 2.—Arrangement of Propelling Machinery on an All-electric Passenger Ship.

Diesel-Electric Drive.—Since the adoption of Diesel-electric propulsion for the beam trawler *Mariner*, which was put in operation early in 1920, there has been marked progress in the application of this type of propulsion over a wide range of vessels—there now being some forty-five ships using this type of drive in operation, or under construction, including tug, ferry, and cargo boats, oil tankers, dredgers, and coast guard cutters. The largest Diesel-electric equipment installed at present in any single ship is of 2,500 shaft horse-power and it would not be surprising if, in the near future, someone went ahead with this form of propulsion in larger capacities.

The most promising field at present, however, seems to be in the smaller craft, especially where a large percentage of the installed horse-power is required for driving auxiliaries, for the same prime mover can furnish the power for both auxiliaries and propulsion; it is admitted that this form of propulsion has its limitations, but operators who have Diesel-electric driven ships seem very well pleased with the results obtained.

The paper includes a list of electrically-propelled ships built and on order to date, the number of such ships being 49 and the total shaft horse-power 561,615. Of these 21 are Diesel-electric ships, aggregating 14,815 s.h.p.. This list shows that great headway has been made in the application of electricity for the propulsion of ships. With the advent of high steam pressure, superheat, steam extraction for feed heating, as well as possible reheating between stages, electric propulsion makes the simplest ideal installation, and results can be obtained equal to, or better than, the best Diesel when total fuel consumption of the whole ship is taken into consideration. Electric propulsion is also ideal for the mercury turbine should this be considered for ship propulsion. Results so far obtained on land prove conclusively that this type of prime mover is more economical than the best of Diesel engines produced so far.

Railway Electrification in France.

Some Particulars of a Section of the Orleans Railway.

By H. PARODI.

(*Abstract of a Paper read before a joint meeting of the* Institution of Electrical Engineers *and the* British Section of the Societe des Ingenieurs Civils.)

This paper does not describe in detail the important electrification scheme now being carried out by the Orleans Railway Company, but merely outlines those features which show how the scheme fits into the general electrification programme of France. In the first part of the paper, the author has outlined the main factors which have dominated the whole of the investigation regarding the scheme of electrification in France and the development and economical use of the country's water power. The second part of the paper is devoted to a brief description of the electrical equipment installed, or being installed, by the Orléans Company.

Part I.

The electrification of the Orléans Railway is of particular interest, not only on account of the importance of the scheme, but also owing to the magnitude of the problems arising in carrying out the work. It was a question not merely of substituting electric traction for steam traction on a line having a dense traffic, but also of providing a large distribution system of which the power plants and transmission lines could

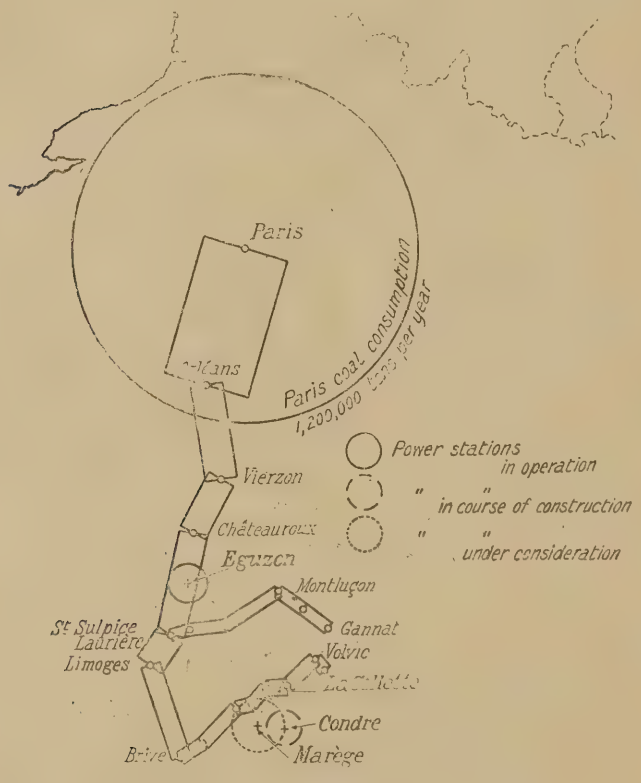


Fig. 1.—Coal Consumption in Electrified Areas.

be utilised for a supply of electric power in all the districts through which the railway passes.

The policy adopted in France in connection with the electrification of the railways is substantially different from that followed in other countries. The substitution of electric power for steam on the railways is considered in France to be one stage of a more comprehensive scheme, whereas in Germany, Switzerland, Austria, Sweden, Norway and other countries, the electrification of the railways is considered independently of the problem of a general supply of electric power. The railways in all the countries mentioned belong to the State, and special power stations and transmission lines have been installed for the generation and utilisation of single-phase current at low frequencies. Two entirely separate and independent systems are thus being developed side by side, the power supply to the industrial system being by three-phase current at 50 periods, and the State power-supply system for electric traction being single-phase current at a frequency of $16\frac{2}{3}$ periods. The only indication of a desire to establish at a later date an electrical connection between the traction and industrial systems, with a view to an exchange of power between them, is that the ratio between the frequencies of the two systems is a whole number, namely $50 \div 16\frac{2}{3}$, *i.e.*, 3.

In Great Britain, France, Belgium, Holland, Spain, Africa (Morocco, Algeria and Natal), as well as in South America (Chile, Argentine, &c.), electric power for traction will be generated and transmitted in three-phase form at 50 periods (60 periods in South America).

Other countries which have followed the policy of interconnecting the traction and industrial power systems have adopted high-pressure direct current at 1,500 to 4,000 volts as their standard for traction. Such current can, of course, be obtained whatever the frequency of the supply. It should, however, be pointed out that in certain countries, such as Italy and Hungary, very interesting tests are at present being made with a view to using for single-phase or three-phase traction three-phase current of a frequency such as is employed for the industrial supply. In Italy three-phase locomotives, having gears and connecting-rods and using current at the industrial frequency, have been tested on the Mont Cenis lines; and single-phase and three-phase 50-period locomotives fitted with synchronous converters on De Kando's system are under test in Hungary on a suburban line near Budapest.

This development, which is taking place in countries where low-frequency alternating-current traction has been in operation for a long time, proves, more conclusively than any theoretical considerations, the practical advantages to be obtained by standardising the various systems adopted for the generation and transmission of electric power.

As the main flow of traffic always follows the same direction whatever the form of transport, it would seem that the general direction of the main power-transmission lines should practically coincide with that of the railway lines which have a very dense traffic, and such railway lines are, as a matter of fact, those where the question of electrification is of most interest. For instance, the railway from Paris to Toulouse through Orléans, Limoges and Brive, is the route of the power transmission line which would allow of an exchange of power between the large steam-driven power stations of the Paris district and the hydro-electric stations of the Central Plateau and the Pyrenees.

It will therefore be understood why the French Government had, even before the war, brought pressure to bear upon the large railway companies supplying districts rich in water power to electrify their systems so as to prepare the way for a still more extensive electrification.

The total coal consumption in France now reaches about 70 million tonnes per year, 75 per cent. of which is obtained from the country's mines and 25 per cent. from English, Belgian and German mines. The whole of the French railways do not consume more than 9 million tonnes, *i.e.*, about 13 per cent. of the total. In order to obtain an appreciable reduction in the amount of coal purchased abroad, which forms a serious item in the trade balance, it is necessary to transmit electrical energy obtained from water power to large cities like Paris, Lyons, Bordeaux and Toulouse, where the coal bill in connection with the generation of the electrical energy required for industry, namely, motive power and lighting, is far bigger than that for traction purposes.

Fig. 1 clearly shows this condition. On each railway line where the electrification is complete or nearly so a rectangle has been drawn having its area proportional to the 1913 consumption of coal for traction on railways. In this connection it should be remembered that the traffic figures for 1913 are now exceeded on all the railways. The circle round the Paris area represents, to the same scale, the fuel consumption in the steam-driven power plants of the Paris district which supply the industrial requirements for electric power and lighting. The amount of coal thus consumed in Paris (1,200,000 tonnes in 1924) is more than three times greater than the coal consumption for steam haulage of all the trains of the Orléans Company between Paris and Brive. By the end of 1935 the consumption of electrical energy in Paris will reach 2,000 million kWh, whereas requirements for electric traction on the Orléans system (the lines from Paris to Brive, from Saint Sulpice to Gannat, and from Brive to Clermont) will very probably not be higher than 400 million kWh. The maximum demand in Paris will be about 1 million kW, whereas the traction demand will not exceed 80,000 kW. The whole problem of the electrification of the Orléans Railway has been dominated by the desire to transmit electrical power from the Central Plateau to Paris without burdening the railway electrification with capital charges which are out of proportion to the present traction requirements. The solution of this problem has been found in the systematic use of transmission lines at as high a voltage as possible.

The use of very high voltages presents considerable advantages from an electrical point of view, particularly in connection with the great strength of such lines and their almost complete immunity from atmospheric phenomena. Economically the advantages are not less important, and they become more evident when, bearing in mind that the amount of power which can be transmitted to a given distance varies as the square of the voltage, it is found that the first cost increases practically only as the voltage.

Owing to the increase in the transmission voltage, a saving is certain to result if we transmit over the same line a long hour load such as traction (say, 4,000 to 5,000 hours per annum), and a shorter-hour industrial load (2,000 to 2,500 hours per annum).

With the pressure of 150 kV now used, it is possible to transmit economically 40,000 to 50,000 kW from the Central Plateau to Paris, a distance of about 280 miles. By increasing the pressure to 220 kV, however, it would be possible to double (*i.e.*, $220^2/150^2$) the amount of power transmitted, and to superimpose on a traction load of 30,000 to 40,000 kW a power load of 60,000 to 70,000 kW, which could be used for industrial power and lighting.

The high-pressure system of the Orléans Company now includes a 150-kV line which can later be converted for use at 220 kV by the addition of a few units and a shield to the present chain insulators. The sizes of the aluminium conductors with their steel cores (293 mm² total section), and also the dimensions of the towers, have been based on the ultimate adoption of the higher pressure. In fact, the normal distance between the conductors (about 25 ft. 6 in.), and that between the conductors and the main supports (about 10 ft.) are larger than those actually employed on the 220-kV lines in operation in California.

In countries like Great Britain where electric energy can be obtained only by burning coal, and in countries possessing waterfalls fed from water sources all of the same type, as in Switzerland, the problem of the generation of electricity is almost exclusively a technical one, particularly when, as is the case in both the countries mentioned, the coal resources in one and the water-power resources in the other are very much larger than the national requirements.

The problem becomes, however, much more complicated in countries like France, where important coal resources and considerable water power are both available at the same time, although the amount of water power varies throughout the year. The coal resources of France are estimated at 22,000 million tonnes*, taking into consideration only those deposits which can be worked with the appliances at present available. With the present output of 40 to 60 million tonnes per annum, coal will thus be available in France for between 400 and 500 years. The water-power resources, which are renewed every year by solar heat, are estimated to represent normally about 5 million kW, of which about 3.3 million kW is in the form of waterfalls fed by glaciers, and 1.7 million kW is in waterfalls depending for their water-supply on rain. Of this total, only 0.67 million kW was being utilised on January 1st, 1925, whilst 0.28 million kW was in course of development at the same date.

The present consumption of electrical energy in France is about 7,500 million kWh, of which about 4,500 million kWh are generated by steam plants, the output of which represents 2,000 hours' use per annum, and 3,000 million kWh are obtained from water power, representing 4,300 hours' use. The combined load of the inter-connected electric distributing systems represents about 2,500 hours' use per annum, *i.e.*, a load factor of about 28 per cent.

The French Government is at the present time considering in close co-operation with the manufacturers, a programme of gradual equipment and of progressive linking-up of the various distribution systems, rather than Government control of electricity generation. The problem is too important, from the point of view of the country as a whole, for the Government not to try to outline the method of generation to be followed; and it is also too complicated, owing to the various opposing interests, to admit of the laying down of a hard-and-fast technical solution.

From the point of view of the rapid utilisation of the waterfalls, decentralised efforts are perhaps desirable, but as regards the operation of the plant and its efficiency, unity of control is essential.

Fig. 2 shows the relative variation in the number of kWh generated and consumed per month, compared with the number generated and consumed per year. The left-hand side of the figure shows the percentage variation in the number of kWh generated by the flow of water in the case of a plant depending on rain for its supply (Central Plateau stations), and also of a plant where the water comes from glaciers (Alpine stations). The right-hand side gives the monthly variations in load of an electric railway system and of an industrial system supplying power and lighting.

As the ouput curves of water-power plants depending on the rainfall are approximately of the same shape as the consumption curves of industrial systems, we can see at once the advantage which there would be in supplying electric power to Paris from the water power of the Central Plateau, it being particularly easy in this case so to adapt the power available that it will meet the demand.

This was realised by the Government when it authorised the Orléans Company to form, with the help of the Société l'Union d'Electricité, the Société l'Union Hydro-Electrique, in order to install the Eguzon water-power plant on the River Creuse.

The fact that this plant has a dam allows the storage of a sufficient quantity of water to form a weekly reserve, without the possibility of seasonal regulation. Owing to the working in parallel of the Eguzon plant (50,000 kW installed) and the large steam power-stations of the Paris district, it will be possible to utilise to the fullest extent the power available from the River Creuse.

In the first stage of the electrification of the Orléans system, the Eguzon plant will represent in the system of power stations of the Société l'Union d'Electricité the equivalent of a 50,000-kW set located at a distance of 300 km (186 miles). This set will be started when water power is available from the Creuse, and it will be stopped when there is no water; but the existence of the weekly reservoir will allow, on the other hand, this power to be used at any time during the 24 hours when this reserve will be most advantageous from the point of view of either economy or reliability.

In the second stage of the electrification of the Orléans system, use will be made of power generated by the hydro-electric plants of the Haute-Dordogne. The equipment of the waterfalls will include for the most important power plants the construction up-stream of a reservoir, in order that the adaptation of the available power to the demand may be secured by the use of this reservoir and by the exchange of power with a neighbouring system having water power-plant of a type complementary to the Central Plateau plants.

Owing to this combination and the policy of mutual assistance, the electric traction service of the Orléans Company will be operated under exceptionally reliable conditions, without the average demand for additional steam power being more than 10 per cent. of the total power. Should, in the future, large amounts of hydro-electric power be transmitted from the Central Plauteau to Paris, the lines of the Orléans Company could be easily adapted for this transmission.

In superimposing the industrial load on the traction load of the various 90-kV and 220-kV lines, it would be possible to transmit economically 100,000 kW a distance of 450 km (280 miles). The author thought it advisable to emphasise this question of electric power production in a complex system, because on its more or less favourable solution depends the success of the electrification, not only of the railway, but also of the whole country it supplies.

If in a country possessing an abundant supply of coal such as Great Britain considerable attention is given to the most economical methods for the generation and distribution of power, it can readily be understood how in France this problem is becoming very important and urgent.

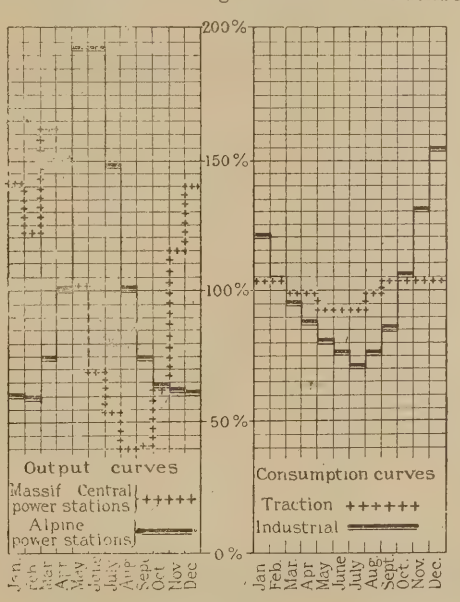

Fig. 2.

(To be concluded.)

*Metric tons.

Discussion in London.

Mr. ROGER T. SMITH opened the discussion by thanking the Institution of Electrical Engineers, as a member of the British Section of the French Society of Civil Engineers, for the facilities afforded to Mr. Parodi for the delivery of his paper in London; and, on behalf of the I.E.E., he thanked Mr. Parodi for coming to this country and giving such an excellent paper. France, he said, was the only country which was working its railway electrification in with a national supply scheme. A great advantage to be reaped by the electrification of the main railways was the speed increase of goods traffic. If distance and time curves were plotted for both goods and passenger traffic, electrification resulted in the two lines or sets of lines becoming nearly parallel—the ideal case—and an average speed of 40 m.p.h. could be easily obtained. This resulted in the opposite to the present conditions, where slow-speed trains were employed, of increased traffic on congested lines. He referred to the excellent conditions of load balance brought about by the opposite seasonal variation in the two French water-power sources for the Central Plateau and the Alpine stations, which had their maximum and minimum outputs at different periods. He thought that interconnection between the two supply centres was essential to the French problem: there was nothing between Paris and Brive except Orleans. The theory was held by some in this country that advantage would be gained by linking up the large centres with h.p. interconnecting lines. He doubted whether such a scheme would be practicable, or whether economy would ever result from it.

Col. O'BRIEN paid a tribute to Mr. Parodi and other French engineers who had conceived the vast electrification scheme. He said it would be interesting to know if the tonne-km. per km. referred to in the paper represented gross or net values. He also asked what precautions were taken in connection with

the very h.p. feeders with regard to the communication circuits. He thought that the type of locomotive without connecting rods would be the most successful, and that the 2D2 type would prove the best. He would be interested to know the anticipated cost of energy; many people had the impression that water power was cheap compared with coal. He criticised the French third rail; it appeared to be expensive and complicated compared with the other patterns. On the whole the paper demonstrated the superiority of electricity over steam, and he thought the paper should be read before the other engineering institutions.

Mr. F. Lydall said the Institution was to be congratulated on having a paper with such a wide range read before it. He thought the principal consideration in connection with main-line electrification was whether the railways should generate their own supply or depend on other concerns. Many railway engineers felt that the question of security of supply was of the first importance. There were undoubted advantages in taking the supply from the general system, but in such a case the general and financial position of the supply undertaking should be beyond reproach. He felt that the circumstances in France were peculiar, and did not apply in this country. A mistake was the tendency to regard railway electrification as something to be "nibbled" at. The sections which were often electrified as commencing stages were too small to show any advantages, and the Paris-Orleans line was an example of how electrification should be dealt with. He advocated the large supply system for railway electrification. On a badly intermittent railway 3,000 kW might be thrown on or off; this would be serious if the supply was from a small station, but on a large system such fluctuations were not important. In a case he had in mind the average load was 9,500 kW, the sustained load 17,000 kW, and the peak load (two minutes) 25,000 kW. He thought too much attention was paid to the question of weight of the locomotive; in some cases it was necessary to increase the weight.

Mr. F. W. Carter said that the outstanding feature of the paper was that it dealt with the electrification of an ordinary railway. Most electrification schemes were the outcome of special problems such as fuel shortage or dense urban traffic such as that around London. In some cases drainage problems or the question of long tunnels brought about schemes for electrifying the lines. The Paris-Orleans railway was a plain line, and if the undertaking proved successful it would show that the programme could be applied to all normal railways. The principal difficulty in the problem of main-line electrification in this country was the question of capital outlay.

Major A. M. Taylor said that in extending the electrification scheme to meet the industrial load in Paris the French Government had done very well. If it paid the French people to transmit a heavy load over a 280-mile line, would it not pay in this country with the present generating costs? The success of the transmission of heavy loads no doubt rested in the question of increasing the transmission pressure. Engineers were not bold enough when preparing schemes of power transmission. Estimates were prepared for loads of 20,000 or 30,000 kW, and did not prove economical; really large loads and high pressures would give better results. On a 100-mile line transmitting 125,000 kW with a 33 per cent. load factor, the sinking-fund and repair charges would be about 0.025d. per kWh, and the loss charge would amount to about 0.017d. per kWh resulting in a figure for the total charges as low as, say, 0.045d. per kWh. In America the transmission of 100,000 kW at 220,000 V was effected with a steam station at each end and a synchronous apparatus at the middle of the line.

Mr. E. M. Malek said the French authorities had grasped the essentials of railway electrification in co-operating with the industrial interests. The paper dealt only with one of the three main French schemes, and it would be interesting to know the results of the whole programme. The capital outlay for electrification on a large scale was enormous because of the distribution lines.

In reply, Mr. Parodi said, *inter alia*, that better results were hoped for as the load on the transmission lines increased. Electrification had resulted in maintaining full speed up the severe gradients, where with steam it had only been possible to result in ¼ speed at the top. The tonne-km. per km. referred to did not include the locomotive. He regretted that comparative energy costs were not available except that in the case of Eguzon the water-power cost was only half of that for steam power—but the ratio was not general. The French railways preferred to use the plant of the supply companies.

Combating Electrical Fires.

The "Lux" Liquid CO_2 System for Power Stations.

The very serious consequences of electrical faults in large power stations which involve a fire risk have emphasised the need for means of combating conflagration of an electrical origin. The usual chemical extinguishers afford excellent first aid protection, provided the seat of the fire can be reached easily in the very early stages, but a fire in a large enclosed generating set cannot be dealt with by such means; or, again, should an oil switch explode in a large switch room it may speedily become quite impossible to cope with the fire that may result from the spreading of the burning oil, which, in turn, may involve other switches and lead to very serious damage and dislocation of supply.

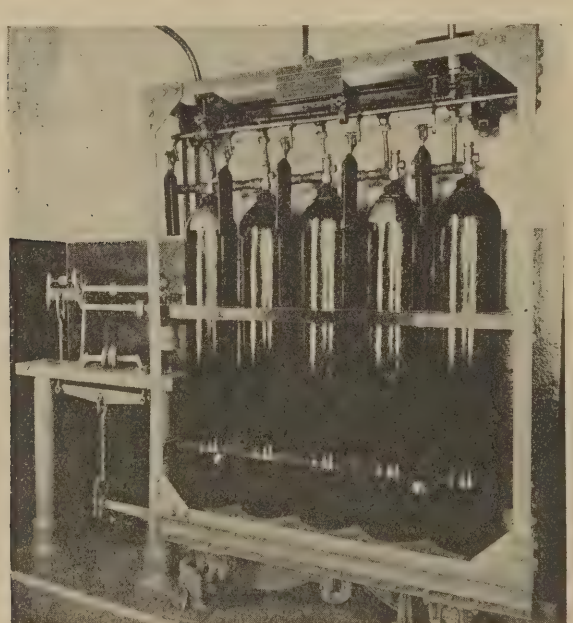

Fig. 1.—CO_2 Cylinders on Scale Balance.

It was to meet this state of affairs that the "Lux" method of fire extinction was developed. This system was first used to deal with ship fires in cargo holds, oil-fired boiler rooms, tankers, &c., and it has been applied to the electrical field, having been installed by Walter Kidde & Co. (Inc.), in power stations in America and other countries.

Carbon dioxide in a pure liquid state is stored in steel cylinders of the usual commercial type, but provided with special valve gear which makes it possible to release in a few seconds very large quantities of the liquid through small-bore pipe lines into the atmosphere surrounding the electrical gear to be protected. The liquid CO_2 at once expands into gas, producing an inert atmosphere in which no fire can live; the

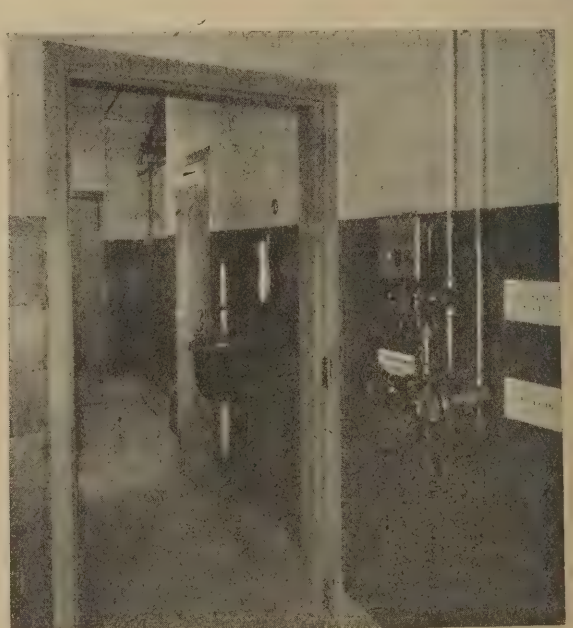

Fig. 2.—Hand-operated Direction Valves and Remote Electrical Release Gear.

very considerable refrigerating action (due to the rapid expansion) produces a chilling effect at the seat of the fire. Carbon dioxide gas has no effect upon insulation, or metals, and its dielectric strength is greater than that of air; thus it can be employed with safety on live high-voltage installations.

The "Lux" system as applied to, say, a number of oil-switch rooms would consist of cylinders of liquid CO_2, fitted with quick-release valves which prevent the liquid freezing before it reaches the fire, manifolded together and connected through distributing valves to piping running to the various switch rooms where the pipes terminate in nozzles arranged to totally flood the whole of the room involved. All the valves can be arranged to be operated either electrically, from any position remote from the switch room, or manually. It is claimed that a room of any size can be completely flooded with CO_2 in a period of from 30 to 40 seconds after operating the quick-release valves, thus extinguishing a fire of any magnitude and at any height in the room, within from 5 to 40 seconds.

This rapid action is one of the secrets of the success of the system, as it gives the fire no time to remove the gas by ventilation, even though a door or window be open. The gas gradually becomes dissipated by ventilation until, after a time varying from ¼ to ¾ hour, no CO_2 remains; thus, a protecting blanket of gas remains for a sufficient time to allow the heated apparatus, oil, &c., to cool. No damage is done by the gas, it is claimed, and there is no moisture or residue to clear up afterwards. Transformer cubicles can be protected in the same way, and the system is particularly adapted for dealing with fires in cable trenches.

Where a batery of cylinders is installed for totally flooding a room, it is advisable to provide a length of hose terminating in a hand nozzle and mounted on a reel, which provides a ready means of dealing by hand with fires in their initial stages. A still smaller, portable, hand apparatus connected to one gas cylinder only has been developed to deal with switchboard fires, and many thousands have been supplied to the telephone companies in America for this purpose.

Success in dealing with a generator fire depends, first, upon extinguishing it within a few seconds of ignition, and, secondly, upon limiting smouldering and preventing re-ignition during the period in which the generator is coming to rest, and for a reasonable time afterwards. In the case of a totally-enclosed machine with a water-cooled ventilating system, two banks of gas cylinders are used: The first contains enough CO_2 to give the whole ventilating system a high enough gas content to extinguish flame within from 10 to 20 seconds of injection. The valve gear is operated electrically by a solenoid actuated by the differential relay of the generator, or it can be arranged for push button control. At the same time that this charge of gas is injected, the turbine throttle would be tripped and the machine would commence to come to rest; meanwhile, due to leakage in the ventilating system enclosure, fresh air would enter the machine and might cause re-ignition, or serious smouldering. The amount of air leakage as discovered by CO_2 gas analysis tests on a number of machines is usually more than is realised, amounting to as much as from 10 to 15 per cent. of the ventilating system volume per minute at normal speeds.

Therefore, the contents of the second bank are injected into the ventilating systems one cylinder at a time by means of delay-action mechanism, so that the CO_2 concentration rises rather than drops, for the whole period that the machine is coming to rest. Hence, the fire can be definitely prevented from spreading round the coils and damage can be confined to the one or two turns which originally broke down.

When machines of the closed type, but with open ventilating systems and air filters are to be protected, special shutters must be provided to convert the machine into a closed type in the event of fire. A number of machines may be protected by means of one cylinder outfit, simply by providing electrically-operated distribution valves and the necessary piping. The action throughout is entirely automatic, and, as will be seen from fig. 1, the battery of cylinders may be mounted on a scale balance to indicate loss of gas by weight. The cylinders are under moderate pressure (744 lb. per sq. in. at 60 deg. F.) and provided with safety valves. Figs. 1 and 2 are views of the installation which protects the oil switches and transformer vaults in the East End sub-station of the Duquesne Light & Power Co., Pittsburgh, Pa., U.S.A. The "Lux" system is understood to be of Swedish origin; it has been developed in America, and is now available in England.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Electric Lamps in Mines.—On February 16th, Mr. W. PALING asked the Secretary for Mines the number of pits in Great Britain where electric lamps were used underground.

Colonel LANE-FOX said that at the end of 1924 there were 356,817 electric safety lamps in use, practically all of them underground, at 1,012 mines.

Imperial Wireless Communication.—On February 16th, Mr. DAY asked the Postmaster-General the present position with regard to the Imperial wireless chain; and what had been the results of the tests made from the Imperial wireless station at Rugby.

Sir W. MITCHELL-THOMSON said that the contractors hoped to complete the Bodmin and Bridgwater stations, which were to be used for the Canadian and South African services early in April, and the Grimsby and Skegness stations which were to be used for the Indian and Australian services, in August next. The corresponding stations in the Dominions and India would, it was understood, be completed at about the same time as the English stations. The tests of the Rugby station showed that it could be received in all parts of the world. The station had been used regularly for the official wireless news service since January 1st and for the transmission of long-distance radio telegrams to ships since January 31st. Owing to its world-wide range, messages could be sent from Rugby to ships at any point on the high seas, however remote; and considerable use was being made of the new facilities thus afforded. The question of operating other services from Rugby was under consideration.

On February 16th, Sir H. BRITTAIN asked the Postmaster-General with which parts of the Empire his department was now in direct wireless communication; and whether any further developments were in contemplation during the current year.

Sir W. MITCHELL-THOMSON said that there was at present no two-way communication by Government wireless between this country and the Dominions, though it was hoped to open such a service during the current year with Canada, South Africa, India and Australia, by means of the beam stations, now under construction here and in those countries. As regarded one-way communication, there had for some years been a regular Press service between Leafield and Halifax, Nova Scotia, and the opening of the Rugby station had now made it possible to broadcast messages for reception in any part of the Empire. At present official news messages were sent out from Rugby thrice daily and good reception of these was reported from places as far distant as New Zealand. In addition private messages for ships anywhere in the world were now regularly transmitted from Rugby and reception appeared to be satisfactory.

Broadcasting.—On February 18th, on a Supplementary Vote for £847,000 for salaries and expenses of the Post Office, including telegraphs and telephones, Lord Wolmer, Assistant Postmaster-General, said that the estimate included £223,000 for radio broadcasting. All the moneys collected for licences had to be surrendered by the Postmaster-General to the Exchequer, and the authority of Parliament had to be obtained before the Treasury could pay out its share to the British Broadcasting Company. It was estimated that the number of licences would entitle the B.B.C. to the sum of £350,000; as a matter of fact it had been paid £573,000. Therefore the supplementary estimate was necessary, but it had not cost the country a single farthing. The item of £190,000 for engineering materials was due to expenditure on a greater purchase of ducts and cables for telephone development than had been estimated last year, and also to quicker work on the part of the contractors.

Mr. AMMON thought that further information should be given as to the expenditure of the B.B.C., a body which was financed by Parliament and was placed in a specially privileged position. A feeling was entertained in certain quarters that the business of the company was being run extravagantly.

Lt.-Commander KENWORTHY contended that the sum of 2s. 6d. charged by the Postmaster-General for issuing a 10s. licence was preposterous. The Post Office must be making an enormous profit. He had been told that the book-keeping charges for similar work by commercial firms worked out at less than 1s. per cent. The Postmaster-General might say that he relayed the programmes over his telephone wires. But this was done at a time when the wires were not in much use, and the relaying was bad. That position would have to be faced presently if the Postmaster-General was to give value for money; he must lay down special telephone wires.

Sir W. MITCHELL-THOMSON, the Postmaster-General, said that at present the question of the future development of broadcasting was being considered by Lord Colwyn's Committee, which hoped to present a report at the beginning of March. It was probable that legislation would be required as a result of this report. As to the suggestion that the Post Office had been guilty of faulty relaying, he had received no complaints from the B.B.C. on that score.

The London Power Company Bill.—On February 22nd, on the order for the second reading of the London Power Company Bill, Mr. ATTLEE, on behalf of the Labour party, moved the rejection of the Bill, the introduction of which, he said, was entirely premature, and which was in direct contravention of the policy of the Government and of the House. The Joint Electricity Authority for London and the Home Counties, which was only established in November, was already considering a technical scheme for bringing the electricity supply of London up to date. The present Bill sought power to set up a capital station in the West London area before any report had been made on that technical scheme. The Joint Electricity Authority was already very forward with plans for a generating station, and was actually in negotiation for a site for it. The site selected by the company was not the best one available.

In the course of further debate, Mr. HANNON pointed out that the Joint Electricity Authority would not be in a position to supply electricity for four years, and the London Power Company had a scheme already elaborated.

Col. ASHLEY, the Minister of Transport, said that, candidly, he was sorry that the Bill had not been held back until the

electricity proposals of the Government had been brought forward. The House would then be better able to pass judgment on such a scheme. At the present stage he must take an absolutely impartial and non-committal attitude. He would advise the House, however, that before the Bill left its control, Section 11 of the Electricity Act of 1919 should be inserted. That would mean that the Electricity Commissioners would have to decide whether the station referred to in the Bill should be built by the London Power Company or by the Joint Electricity Authority. He would also suggest that there should be inserted in the Bill a clause giving an option of purchase to the Joint Electricity Authority if the Electricity Commissioners decided that that Authority and not the Power Company was the body to build the station, He hoped that before the third reading of the Bill was taken, the Government proposals would be before the House, and they could judge what reception they should give to the measure.

The Bill was eventually rejected by 137 votes to 110.

Legal.

Attorney-General (St. Pancras Borough Council) v. County of London Electric Supply Co., Ltd.

Mr. Justice Tomlin gave judgment in the Chancery Division on February 19th in this action. The point at issue was whether the defendant company or the St. Pancras Borough Council were entitled to supply electricity to the new buildings erected by Messrs. Hulton in Gray's Inn Road, W.C. His Lordship said that the boundary line between the borough of Holborn and the borough of St. Pancras formerly ran east and west through this property. By an Order in Council dated May 15th, 1900, the boundary was moved further south, bringing the whole of the property within the boundary of St. Pancras. The relators (the St. Pancras Borough Council) were and had been at all material times authorised under the St. Pancras Electric Lighting Order, 1883, to supply electricity within an area that comprised the southern boundary of the property in question. The defendant company had, since 1897, under the County of London Northern Extension Electric Lighting Order, 1897, been authorised to supply electricity in an area corresponding with the borough of Holborn. The area of supply of the St. Pancras Council extended southward only to the old boundary of the borough of St. Pancras, and included the northern part, but not the southern part, of the property, while the area of supply of the defendant company extended northward as far as the old boundary and included the southern part, but did not include the northern part of the property. Messrs. Hulton, having completed part of their proposed building, approached the St. Pancras Council to negotiate terms for a supply of electricity, the St. Pancras Council being then erroneously under the belief that its area of supply included that portion of the borough that had been transferred from the borough of Holborn. Ultimately these negotiations were broken off, and Messrs. Hulton entered into a contract with the defendants for a supply of electricity. The amount of electricity being consumed at present upon the land south of the old boundary was trivial compared with that being consumed on the land north of the boundary. The St. Pancras Council claimed that electricity was being illegally supplied by the defendants outside their area of supply. Defendants contended that the supply given by them to Messrs. Hulton was given within their area of supply. His Lordship found that a substantial part of Messrs. Hulton's property was within the area of supply of the defendants, and that only a small quantity of electricity was at the moment being consumed on that part, but that there was reasonable ground to anticipate an increased user in the near future. He also found that the ends of the lines belonging to Messrs. Hulton on which electricity was passed to them from the service lines of defendants were within the area of supply of the defendants, and that the consumers' terminals of supply were in substance and fact within defendants' area of supply. Throughout the relevant Acts and Orders he thought a distinction was drawn between supply and use or consumption; that point was illustrated by the phraseology of the definition of consumers' terminals in Section 2 of the Order, as the ends of the service lines on which the supply was delivered, and by the terms of the prohibition in Section 18 of the Act of 1882 against any interference by the undertakers with the manner in which any electricity supplied by them was used. He found that the obligation to supply and the power to supply were not necessarily co-terminous, and even if no supply could be demanded except in respect of and for premises wholly within the area, no argument was thereby afforded for limiting the power of supply if, apart from that contention, such power appeared on construction to be wider. The obligations and powers of the undertakers in relation to the supply to a particular consumer were, speaking broadly, confined to their own side of the consumers' terminals, and it was upon the undertakers' side of, or at the consumers' terminals, that the amount of the supply had to be measured and its pressure ascertained. The method of user of the supply, unless, at any rate, it resulted in interference with the efficient supply by the undertakers to other people, did not concern the undertakers at all or give them any right of inspection on the consumers' side of the terminals or right to cut off the supply. Section 5 of the Electric Lighting Act, 1909, and Section 8 of the London Electricity Supply Act, 1908, did not, in his judgment, afford sufficient ground for displacing the conclusion which otherwise he had arrived at. Section 5 of the 1909 Act seemed to draw a clear distinction between supply and use. Finally, he held that supply did not mean supply for use or consumption, but supply in the sense of delivery at the consumers' terminals. There was nothing in the language of Section 5 or 6 of the Order or in Section 23 of the Act of 1909 to render illegal that which, upon the facts as he had found them, the defendants were doing. It followed that the action failed and must be dismissed, with costs.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Government Electricity Scheme.

I trust you will allow me to reply to Mr. Allcock.

Perhaps I did not make myself clear, but the 3d. was the price of the current received at our works. If Mr. Allcock can distribute it at 6d., 2d. and 1d. and show a profit, I should be glad to hear how to do it.

In conclusion, even if I could buy in bulk at 3d. a unit at the switchboard here, I maintain that it is sheer folly and absolutely uneconomic to sell at any price less than 3d.

It would be interesting to have the opinions of some of our large commercial houses on this point. I cannot see Barker's or Whiteley's buying large stocks of apples at 3d. a lb. and selling at 1d. in the hope that someone will buy oranges at 6d. on which they may have a good profit.

C. Culmer Hodges.

Dawlish, *February 15th*, 1926.

The Cost of Living in Cyprus.

I should be very glad if you could give me, or refer me to someone who can, some details as to the cost of living, and general conditions, in Cyprus.

Cyprus.

February 15th, 1926.

The All-Electric House.

In his letter in your current issue, Mr. E. W. Dickinson states that I am at fault in quoting from the figures in his article "Fuel Economy and the All-Electric House."

He clearly gave gas 12½ per cent. of the 100 per cent. of the c.v. of the coal. In this connection the points in my letter will be clear enough.

But if it is now claimed that gas offers 37½ per cent. of the c.v. of the coal, alongside of 17 per cent. for electricity, what becomes of the miserable 30 per cent. for gas *plus* coke mentioned in the article?

I like Mr. Dickinson's good intentions to "make our industry absolutely impregnable." He can safely amuse himself by handing out scaling ladders to the assailants to prove it so.

February 19th, 1926. **Invictus.**

The Testing of Transformers.

We note in your issue of February 19th, 1926, page 289, a short article on "The Testing of Transformers; Some Observations on a Method of Ratio Testing," by Mr. D. Pedley.

While we have read Mr. Pedley's article with interest, we must submit that his criticism is unjust in that it refers to a diagram, fig. 2, drawn up by himself, which is obviously wrong, and will not function correctly.

Mr. Pedley has been misled by the abstract printed in your issue of January 29th. The full text reads as follows:—

"The low-tension winding is connected in opposition across a part of the resistance R, also tapped through suitable dial switches to a sensitive wattmeter movement to show the balance of the two circuits, the field coils of which are excited off the h.t. supply."

The wattmeter movement shown in our diagram has the field coils specially wound for the a.c. supply, and the moving coil is of low resistance.

Our diagram is only intended to show a general arrangement, and allows of several modifications depending on the type of transformer to be tested. We have had experience of three such instruments of different ranges for a considerable period, and find them of great service and accuracy. In one of these instruments the wattmeter field coils are specially wound to go across the supply of 220 volts, and the other two are arranged with a small transformer to step down from the supply to give the correct current for the wattmeter field coils.

The wattmeter is a polarised instrument, and is usually a centre-zero instrument; thus it can be marked to indicate + or − ratio error.

J. Lindley Thompson, M.Sc., M.I.E.E.
H. Walmsley.

Newcastle-on-Tyne, *February 22nd*, 1926.

North-West Midlands Electricity District.

Electricity Commission's Inquiry at Stoke-on-Trent.

On Wednesday, February 17th, an inquiry was held at the Town Hall, Stoke-on-Trent, by the Electricity Commissioners, Sir Harry Haward and Mr. S. L. Pearce, with Mr. J. C. Walton (legal adviser) and Mr. D. S. Cumberlege, with reference to the area to be included in the North-West Midlands Electricity District and to consider a scheme for improving the existing organisation for the supply of electricity and for the formation of a Joint Electricity Authority. The promoters were all the authorised undertakers within the district which had been delimited by the Commissioners, namely, the City of Stoke-on-Trent, the Borough of Newcastle-under-Lyme, the Urban District Council of Leek, and the Market Drayton Electric Light & Power Co., Ltd. They were represented by Mr. Craig Henderson, K.C. There were also present Alderman H. Keese and Mr. H. H. Battle, chairman and secretary, respectively, of the Conference of Authorised Undertakers promoting the scheme, and officials of the bodies concerned.

Mr. CRAIG HENDERSON said the area of the district was 636 square miles and the population was estimated at 530,703. The bulk of the population was gathered into industrial centres, but the greater part of the area was rural and agricultural. Provision was made for the erection of a new station when justified by the demand (on what was considered to be the most suitable site) at Barlaston, midway between Stoke and Stafford. The two main stations, at Stoke and Stafford, were capable of considerable extension; by bringing them up to a capacity of 31,000 kW and linking them with high-pressure mains, with further links to outlying places, immediate requirements would be fully met. Leek had its own station, but would soon want a supply from Stoke, and so a link from Stoke to Leek was proposed. Congleton was anxious to have a supply; it had none to-day, and a station of its own was not justified, so that provision had also been made for a link from Stoke to Congleton which would be connected also with Leek. At some date in the future Leek would be linked with Uttoxeter, and Uttoxeter with Stafford. Uttoxeter could not justify a station of its own, and Newcastle-under-Lyme was already linked with Stoke. When the territory in the south-west developed, Market Drayton could be linked through Newcastle and also directly with Stoke.

Sir HARRY HAWARD asked whether it was the idea that Congleton and Uttoxeter should obtain Special Orders to enable them to distribute electricity, the supply being taken in bulk from the Joint Authority.

Mr. O. W. WHITTER, Mayor of Congleton, said the Borough desired to have its own Order and become the distributing authority.

Mr. CRAIG HENDERSON stated that the Conference had no objection to the municipal bodies taking the course they thought best. The Council of Stone was applying for its Order, which would probably be a precedent for the others. The position to-day was that Stoke had the "chief power house," which had 17,000 kW of plant; there were two smaller stations with about 1,000 kW each which would be used as sub-stations for distribution purposes.

Ald. HARRY LEESE said he had been chairman of the Stoke-on-Trent Electricity Committee for 15 years and was also chairman of the Conference of Authorised Undertakers promoting this scheme. With regard to the administrative part, they were prepared to take as the general text the Order made for the West Midlands District. The Conference was unanimous that the time had not come to erect a new generating station; by extending the stations at Stoke and Stafford the demand would be fully met for a considerable number of years. His Council was prepared to transfer the Stoke station to a Joint Electricity Authority, as the pooling of resources could not be done effectively unless that Authority had control of the whole of the supply.

Sir HARRY HAWARD: Have you considered the possible bearing which the Government's new electricity proposals may have upon this scheme? The Witness replied that they seemed quite nebulous. If a main transmission line passed through the area within easy distance of Stoke and Stafford it might be they would not require to build the Barlaston station, but, so far as the immediate supply was concerned, it would not have much effect. Their difficulty was not one of generation, but of distribution, and a cheap supply in bulk would not appeal to them unless it was cheaper than they could generate it for themselves.

Mr. ARTHUR ELLIS, M.Inst.C.E., M.I.E.E., M.I.Mech.E., said he had acted as advisory engineer to the North-West Midlands Conference. For the erection of a new station Barlaston was the best available site; there was, however, no need for a new station at present. During the last four or five years the demand had increased at the rate of 1,000 kW per year, but in his calculations he had assumed an annual increase of 2,000 kW during the next ten years. Extensions of 10,000 kW at Stoke and 5,000 kW at Stafford would meet the whole requirements, and the buildings for that plant were already available. Both stations could go up to 31,000 kW, and if necessary (by putting in larger sets) Stoke could be extended to 46,000 kW; by linking them together, the spare plant at one would be capable of meeting the requirements of both. The main link was a double circuit of 0.2 sq. in. operating at 33,000 volts, which would be extended, first, to Leek, and then come back, through Uttoxeter, to Stafford. The demand in Market Drayton did not justify a 33,000-volt line, and it was proposed to provide an intermediate system of transmission at 11,000 volts. He did not think the scheme could be dispensed with by taking a supply from a main transmission line passing through the district, if the Government proposals were developed in that direction. It would be a question of the terms at which supplies could be delivered, compared with the price at which they could produce their own. He did not contemplate that such transmitted supplies would be available in the next two or three years, and extensions must be made at Stoke or Stafford within that period. The extensions would cheapen production; they were now paying 16s. and 17s. per ton for coal. During the winter they had installed at Stoke four larger boilers of higher steam capacity and a 5,000-kW turbo-alternator, and the Stoke engineer was contemplating the possibility of raising steam from a cheaper grade of fuel, costing 14s. to 15s. per ton of less, and with the new plant in regular service the steam consumption would be something like 10½ lb. per kWh as compared with 13 or 14 lb. with the older plant. The same thing applied at Stafford, where new plant had been installed within the last 12 months.

Sir HARRY HAWARD asked what economies would be effected by linking the two stations and pooling their resources. In Mr. Ellis's opinion the economies to be effected would enable supplies to be available at the bus-bars at 0.675d. per kWh, after taking into account capital charges. There were five separate stations operating in the district, and the peak loads on all of them coincided; there was no diversity of load. The summer load was practically half the winter load and one station (under a proper arrangement) could supply the whole of the district.

Sir HARRY HAWARD: But you are not going to connect all these stations for 15 years? Mr. ELLIS replied that they wished to connect Stafford and Stoke immediately. The station at Leek could serve a useful purpose, but if the demand there required additional plant it would be cheaper to take a transmission main to Leek and give a bulk supply. Newcastle was already linked and taking the greater part of its supplies in bulk from Stoke. That left out Market Drayton, which was very remote. The demand at present was 120 kW, and a transmission main would cost something like £17,000. Taking a period of 10 years, during which extensions of 10,000 kW at Stoke and 5,000 kW at Stafford would be sufficient, he estimated that a kWh could be delivered at the bus-bars of the various distribution authorities at a cost of 0.608d., including all charges.

In reply to Mr. HERBERT, the witness said he did not know anything about the condition of the tramway generating stations. If the figures given him regarding the tramway requirements were correct (5,000,000 kWh, maximum demand 1,622 kW, load factor at one station from 34 to 37 and at the other from 38 to 42), it would be to the advantage of the Joint Authority to take the load. In the scheme under consideration he was working on the footing of a load factor of 30; his experience was that the tramway load overlapped the lighting load at the most awkward period of the day. If the tramway load could be fitted in between off periods, the Joint Authority would quote appropriate terms, but to do that it would be necessary to shut down the tramways during part of the day.

Answering Mr. PEARCE, the witness said the maximum demand for the year ending March 31st, 1925, was 12,907 kW. During the present winter the combined maximum demand had been 14,096 kW. According to his schedule the maximum potential demand in the district was 50,000 kW, divided between four different classes of supply. A difficulty arose from the fact that most of the collieries, which might be looked upon as potential customers, had their own blast-furnace plant and utilised their waste gases to provide their own supplies, but he did not think any works which had their own plant had been omitted in arriving at the total of 50,000 kW. It represented the ultimate possible demand at the time the figures were taken out. A very important manufacturing firm was proposing to establish works at Stoke, and negotiations were proceeding regarding the supply of electricity to that firm. An ultimate demand of some 10,000 kW of load was anticipated with a load factor of 50. This was not included in the 50,000 kW, which figure might be further increased by the introduction of new industries. His estimates of coal consumption showed that in 1930, the present average of 2.796 lb. being reduced to 2.25 lb., there would be a saving of 17,000 tons of coal, representing £12,000. The scheme set out what, to his mind, was the only way in which the rural areas could be opened out. Under existing conditions they could not develop a 33,000-volt transmission system to a place which had a maximum demand not exceeding 315 kVA. Of course, if the district developed at an

extraordinary rate, a cheaper line might be run. In a national scheme he assumed the pressure of transmission would be in the neighbourhood of from 110,000 to 120,000 volts. It would be better to have a Joint Authority representing a large area than five different authorities negotiating separately for supplies.

Mr. Pearce was surprised that there was no diversity factor. Was there no difference between Stoke and Stafford?

Mr. Ellis replied that they pretty well coincided, but he was not going to say that that would continue.

Mr. Herbert asked that provision be made that if the Potteries Electric Traction Co. took a bulk supply, the company should not be required to pay more than it would cost to generate the supply itself.

Ald. G. P. Dean, for the employés' side of the National Joint Industrial Council, suggested that the workers be allowed to have two representatives upon the Authority. Mr. W. A. Jones asked that there be one representative of the employés' side of the Joint Industrial Council and one representative of the employés' side of the District Joint Board.

Mr. Craig Henderson replied that at present the number of workers at the five stations did not exceed 60. When they got high-pressure main transmission and so on the number might go up to something like 100. One representative was sufficient. There was no objection to the working together of the two bodies representing the staff workers and the manual workers. The proposal put forward by the Potteries Electric Traction Co. amounted to asking that the amortisation charges for its present generating plant shall be borne by the Joint Electricity Authority.

The inquiry was then closed.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 17th :—

E.M.S. (lettering and design). No. 456,534. Class 6. Mechanical signs for advertising purposes. No. 456,535. Class 8. Electric batteries (not medical). No. 456,536. Class 13. Electric lamps (ordinary).—Electrical Name and Numerical Sign Co., Ltd., 30, Little Newport Street, Charing Cross Road, W.C.2.

Orion. No. 465,918. Class 6. Electric vacuum cleaning machines.—Electrical and Manufacturing Co., 7-13, Clavering Place, Newcastle-on-Tyne.

Radio Palaba, P.S.P.S. No. 465,906. Class 8. Instruments and apparatus for use in radio-telephony.—Pala. A. Spal, Slany, Czecho-Slovakia. (British representatives: E. R. Royston & Co., Tower Building, Water Street, Liverpool.)

Banbat. No. 465,586. Class 8. Radio-telephonic and telegraphic apparatus.—Prima Co., Ltd., 12, Commercial Street, Birmingham.

Onyx. No. 465,919. Class 8. Electric discharge tubes for radio and wired telegraphy and telephony, X-ray tubes, not employed for medical or surgical purposes, and rectifying tubes.—Mullard Radio Valve Co., Ltd., 45, Nightingale Lane, Balham, S.W.12.

Wandem. No. 466,247. All goods in Class 8.—Wainwright Manufacturing Co., Ltd., 531, Forest Road, Walthamstow, E.17.

G.P. (lettering and design). No. 462,607. Class 13. Electrical switches, contacts and terminals, electric-lighting fittings and accessories, fusible cut-outs, electric bells, junction boxes, ignition plugs, &c.—Gilbert Productions, Ltd., King's Road, Hay Mills, Birmingham.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The

Electrical Review

VOL. XCVIII. MARCH 5, 1926. No. 2,519.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

LIST OF FOREIGN AGENTS (see first page "Official Notices").

Politics and Electricity.

ONCE again electricity measures have been caught in the whirlpool of politics. The London Power Company's Bill enabling it to build a station at Brentford, and the Metropolitan Company's Bill to extend its area, have both been rejected, not on their merits, but because of a fear that they would perhaps prejudice the work of the London Joint Authority, the suspicion of Socialists, and so forth. It is a lamentable thing that electricity development should become the subject of contention between rival political parties, and we sympathise with the Companies which have thus suffered a set-back. But companies, themselves, are not always entirely innocent of countenancing similar tactics; in fact, if our memory serves us, it was the West End Companies that started this particular hare—or if not, at least they joined in, in full cry. Mr. Attlee, in moving the rejection of the London Power Bill, seemed almost to be speaking from the West End Companies' own brief when they opposed the Barking station scheme some years ago, urging that no new station should be built before the Joint Authority's plans were fully matured, and that the site chosen was not a good one. Mr. Attlee said that "the Bill was a misguided attempt to get in first and queer the pitch of the larger scheme." We have an idea that, in substance, that was exactly what the West End Companies said at the Commissioners' inquiry about Barking. But we do not wish to press the point. We mention it merely because it points a moral—one that will be heeded in the future, when all the schemes require to be constantly dovetailed together. The moral is that all electrical parties themselves should deal with all matters on technical and commercial grounds, on their merits, and never invoke political issues or join forces, in a particular case, with political sections, especially when they violate their own principles by doing so.

It is to be regretted that the Metropolitan Electric Supply Company's Bill, which was warmly supported by the Minister of Transport, was not allowed to proceed. We fully recognise the right of the London and Home Counties Joint Electricity Authority to control electrical affairs within its District, but the Minister pointed out that the Company was willing to meet almost all the objections of the Authority, and stated his inten-

tion of taking steps to safeguard the interests of that body if and when the Bill came under the consideration of a Select Committee. As Mr. Harmer showed at the last "Informal Meeting" of the Institution of Electrical Engineers, the Metropolitan Company has made rapid progress in developing its area outside London since the war, and with enlarged powers would have been able to hasten the provision of electric light and power in regions at present inadequately supplied. It was unfortunate, therefore, that the Bill was summarily rejected by a vote which cannot be regarded as representing the considered opinion of the House of Commons.

Incidentally, the rejection of these Bills shows that any comprehensive project has its bad side, and that is, that it can be used actually to frustrate electrical development. Now that there are Joint Authorities, Advisory Committees, and so on, and a National Board in prospect, it seems likely that unless some way out of it is found, any malcontent body can obstruct a new project by playing off one party against another. An instance on a small scale was recorded recently when new Orders for areas uncatered for were objected to on the ground that such areas were in an Electricity District and that it was the duty of the Joint Authority to deal with them. Now, this sort of thing can go on indefinitely. A little more goodwill among the parties is the best remedy, but as we are not over-optimistic as to this, we suggest that the Commissioners should have fuller powers to enable them to deal summarily with such obstructionists. The Commissioners should decide in their own minds what authorities can be trusted to get on with their job, and deal ruthlessly with mere obstructive tactics. Up to the present thick-skinned "authorities, companies, and persons" have simply taken advantage of the unfailing courtesy of the Commissioners. The sooner electricity is out of the hands of politicians the better, and the more scrupulously all electricity authorities keep political weapons out of their armoury the better too.

Spinning Electrons.

The analysis of the infinitesimal has been carried so far by men of science whose fertile imagination seems to be a most efficient substitute for a "double-million magnifyin' gas microscope" that even the atom has yielded up its secrets, and is known to be an organised body of considerable complexity. The electrons, revolving around the nucleus at planetary distances, are exposed to attack, and have been so successfully bombarded that their places in the atomic cosmos have been pretty accurately defined; to them and their orbital changes are due the "quanta" which give rise to radiation, and thus convey to us light and heat, their functions being indispensable to our continued existence. The nucleus is a much harder nut to crack; Prof. Millikan and others have lately identified a radiation of exceedingly short wavelength which appears to be due to nuclear changes, and Dr. Jeans has quickly developed the idea, but the nucleus remains somewhat intractable.

But if we thought the electron had been reduced to its lowest terms, we reckoned without one last possibility. The jumps of electrons from orbit to orbit provide an explanation for many of the lines of the spectrum, thanks largely to the inspired labours of Prof. Niels Bohr, of Copenhagen, but much remains to be done before the spectrum is wholly understood; now, in a letter from Messrs. G. E. Uhlenbeck and S. Goudsmit, of Leyden, to *Nature* of February 20th, we are invited to make a further step—to conceive of the electron itself as spinning on its own axis whilst it revolves around the nucleus. Moreover, the axis of the spinning electron is assumed to be subject to precession. To render the resemblance to the solar system complete, we only need a satellite revolving around the electron!

It is stated by the authors that the hypothesis of a spinning electron sweeps away many of the difficulties still presented by the spectrum, and in a letter commenting on the theory, Prof. Bohr himself gives it a hearty welcome, his enthusiasm growing visibly as he writes.

We do not pretend to understand the details of the theory, which is a matter for specialists, but we wholeheartedly admire the work of these able physicists, who from a few seemingly inadequate clues can thus by sheer force of intellect construct convincing theories for the constitution of giant stars and for the structure of invisible atoms, continually pressing their attack farther into the hidden mysteries of nature and science.

Electricity Supply in Yorkshire.

Elsewhere in this issue, in our series of articles dealing with electricity supply in Great Britain, we reproduce a map showing the present position in the county of Yorkshire—an area covering one-tenth of England and Wales, containing one-tenth of the population of Great Britain, and including some of our most important industrial centres, engaged in the coal mining, textile, and steel industries. The supply of electricity is in the hands of numerous municipalities and a very few companies, amongst the latter, however, being one of the largest and most successful Power Companies.

At the recent annual general meeting, the chairman, Mr. A. G. Lupton, reviewed the recent history of the Yorkshire Electric Power Company, and showed how on three occasions—in 1918, 1921, and 1925—impending legislation had put a brake on the development of electricity supply, which had also been delayed by the protracted negotiations and inquiries involved by the endeavours of the Electricity Commissioners to reorganise the area with the co-operation of the great municipal undertakings. Even when, after three inquiries, an agreed scheme for part of the area was embodied in a Bill which was supported by the Electricity Commission, a Parliamentary Committee rejected it in 1924 and thus destroyed the work of years. Consequently the Company was thrown back upon its own existing statutory powers, and since May last year it has been engaged in developing its area on those lines. The Thornhill power station has been greatly extended, and the new station at Ferrybridge—for which the site was purchased in 1917, *nine years ago*, but which has been held back by the continual uncertainty prevailing with regard to new legislation or reorganisation—will be running next summer, when the Company will have 93,500 kW of generating plant installed, and 340 substations in operation. Where it has been possible, through the medium of the associated Distribution Company, to supply electricity for domestic purposes, in some new centres every house is on the mains; many municipalities have closed their generating stations and take a bulk supply from the Company, whose standards of pressure and frequency, adopted in 1901, are identical with those now accepted as national standards, and are being brought into effect throughout its area. Moreover, Mr. Lupton stated that the Company was on good terms with its neighbours, and was prepared to co-operate with them. In fact, if only it had authority to supply electricity throughout its area for other purposes besides power, it would be able and willing to develop the supply of electricity as efficiently as any Joint Electricity Authority; and we see no reason why it should not be allowed to do so, as the Mersey Power Company has already been permitted to do. The attitude of the Minister of Transport towards the Metropolitan Electric Supply Company's scheme, embodied in the Bill which came to an untimely end last week, seems to imply that the Government is not unfavourably disposed towards such methods, and the Prime Minister's avowed intention to foster private enterprise strengthens that impression. In Yorkshire, at any rate, there seems to be no hope of inducing the big Corporations to merge their individualities in a joint co-operative scheme, and we do not believe that the Government will attempt to exercise compulsion.

ountry House Fires.

No one who loves the countryside can observe without keen regret the frequency with which the fine old mansions bequeathed to us by by-gone genera-ns are destroyed by fire, often accompanied to their d by irreplaceable artistic treasures. There is a ndency to ascribe these catastrophes to "the fusing of electric wire," not because there is a shred of evi-nce to that effect, but merely because the phrase is ndy and there is no evidence to the contrary. There e, however, various alternative solutions to the pro-em, of at least equal probability, and we are by no eans disposed to let judgment go against the electrical stallation by default.

For one thing, these old buildings were usually wired contracting firms of well-earned reputation for the e of sound materials and good workmanship, who tained the work not by cut-throat competition but by commendation, in the more spacious days when the ners of such mansions could afford to pay a fair price r a good job. The proper use of fusible cut-outs was ll understood, and the wiring was generally heavier the time of carbon-filament lamps. Moreover, the ltage was lower than is customary in connection with blic supplies nowadays—50 volts in the smaller build-gs, and seldom over 110 volts in any case—a condi-n further implying the use of heavy conductors, which re commonly enclosed in wood casing.

Such installations, in dry buildings, were as safe as uld be wished, and would remain so even after five d twenty years—so long as they were undisturbed. has been pointed out, however, in a letter to *The Times* Mr. S. G. Castle Russell that after many years the bber insulation is almost certain to have "perished"; that condition it is brittle, and cracks on small pro-cation, so that if the wires are disturbed, the insula-n ceases to be waterproof, and the access of moisture adily causes leakage of electricity which may char the sing and eventually lead to fire. Hence when exten-ns are made on such an installation, the wiring fected ought to be renewed right back to the fuse-ard.

As Mr. Russell rightly states, the owners of houses ntaining valuable pictures and heirlooms should have eir wiring inspected to make sure that it is not a tential danger. In a later letter, Mr. D. L. Solomon, R.I.B.A., supports these views, but also indicates the ngers attendant upon the fixing of modern stoves in d houses, and upon the use of existing flues for central ating systems in such buildings. The great heat ven out by modern heating installations demands the loption of special precautions, even to the extent of ilding entirely new flues.

According to *The Times*, many of the fires reported have occurred in country houses are believed to have iginated in the roof—a circumstance which in itself nstitutes a good alibi for electricity; for who ever ard of the attics of such a building being wired? On e other hand, the flues are there, probably well lined th soot and close to dry old timber. The attics are rely visited, and a fire may get well started there fore anyone suspects its presence.

None of the letters that we have seen points out that ctricity, though it may sometimes be the cause of fire, so provides a remedy. An outbreak of fire can nerally be easily extinguished if it is tackled in-antly; and electrical fire-alarm systems are now so icient that they can be relied upon to give warning fore a fire has made good its hold. The outlay of a w pounds on such systems would in many cases save ns of thousands in material loss, to say nothing of e mental distress consequent upon the destruction of beloved home, and it is strange that the Fire Offices not insist upon such precautions in the case of avily-insured buildings. As Mr. R. J. Moffett sug-sts in our "Correspondence" columns to-day, the ire Offices might well undertake the duty of inspection new installations—and, we would suggest, the old es too; by that course they would stand to gain in e long run.

After the Fair.

From the reports that have reached us from various directions, we judge that electrical exhibitors who took part in the British Industries Fair at Castle Bromwich, Birmingham, have good reason to be satisfied with the result attending and following their efforts. We have heard of gratifying electrical orders that have been placed by Home, Colonial, and foreign buyers. Taking the Birmingham show as a whole, it is stated that there were formal acceptances of invitations by 35,000 buyers, and an actual attendance of 50,000 buyers. The visits and meetings of electrical associations were very successful, and altogether the whole affair has provided the local committee in particular and the trade in general with practical experience which should materially assist them in planning next year's Fair. Electrical manufacturers who had not been able to patronise the show this year owing to the short time left in which to make arrangements, were observed making a tour of the Electrical Section, and probably they have formed resolutions for the future. Individual orders placed include some for considerable numbers of electric motors, and an order for six oil engines booked by one firm, to the value of £4,800; New Zealand and South African electrical buyers were present and placed business, while one of our representatives reports the presence of a party of Germans who were greatly interested in the exhibits of electrical equipment and wireless accessories. Australian, Indian, Spanish, and Argentine buyers placed orders for hardware, while Continental and other visitors made requisitions for tools, pumps, weighing machines, brass steam fittings, and so on. It is said that the orders placed for all classes of British products at Birmingham amounted to £2,000,000 in the twelve days, and inquiries and signs point to many millions of pounds more to follow as a direct consequence of the Fair there. It is small wonder, therefore, that the space booking for next year promises to be much larger than for 1926, and that the Government is to be urged to repeat its £25,000 propaganda contribution as an annual grant. The Birmingham buildings will have to be extended, and there is talk of the Government's being asked to secure the White City permanently for the London Fair.

Porcelain Insulators.

A visit to The Potteries is an event of such interest as to be long remembered with pleasure, for the art and skill of the potter are proverbial; and when such a tour is undertaken by an electrical engineer with the object of inspecting the several factories of one of the largest porcelain insulator manufacturing concerns in this country, he will be particularly well rewarded. Porcelain insulators and fittings for the electrical trades are used as a matter of course, and few of those who are called upon to employ accessories of this kind realise to what dimensions this section of the local industry has grown of late years.

Messrs. Taylor, Tunnicliff & Co., Ltd., have been known for close on 60 years as makers of porcelain, and the fact that they have been producing high-voltage insulators for more than 25 years places them amongst the foremost authorities on such wares. The term "high-voltage" had, however, a somewhat different meaning then from that which is conveyed by the words "high pressure" to-day, and the methods and processes involved in the production of reliable, good-quality insulators have had to be modified accordingly. If the article which is commenced elsewhere in this issue serves to initiate some of our readers into the varied operations connected with, and the degree of modernisation that has been brought about in, this important industry it will not have been written in vain. The changes that have taken place may be gauged, in some degree, by comparing the impressions of our recent visit with those recorded 18 years ago in the Electrical Review of March 6th, 1908.

The Telephone, 1876—1926.

By J. E. KINGSBURY.

On March 7th, 1876, Letters Patent (No. 174,465) were granted by the Government of the United States to Alexander Graham Bell for an invention which was entitled "Improvement in Telegraphy." There were five claims, the last reading: "The method of and apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth." The "undulatory electrical current" runs through the specification. The use of, and the methods for producing, such a current are covered by the other claims. They are: a receiver set in vibration by the employment of such currents; the employment of a permanent magnet or other body capable of inductive action; the gradual increasing and diminishing the resistance of the circuit or the gradual increasing and diminishing of the power of the battery.

To reap a reward it is not sufficient to invent: it is also necessary to protect the invention. In March, 1881, eminent patent counsel advised the Bell Company that "the Bell patents cover every apparatus capable of transmitting articulate speech by electricity which has yet been devised, and the more carefully the subject is examined the more certain it appears that no instrument can do it except by copying the method invented by Mr. Bell and patented to him by his patent of March 7th, 1876." They advised well. His invention received the widest protection throughout the patent's life.

On June 25th, 1876, the Bell instruments were submitted to the judges at the Philadelphia Exhibition, of whom one was Lord Kelvin (then Sir William Thomson). To a colleague he said that what yesterday he would have declared impossible he had that day seen realised. But the laconic exclamation of the Emperor of Brazil, who was present as an interested observer, indicates more clearly the contemporary surprise at what had been accomplished. "My God, it talks," said Dom Pedro. Yes, it talked! The transmission of speech hitherto considered impossible had been achieved.

Bell acquired fame, and, with his associates, a certain modicum of wealth. The civilised world acquired a means of communication of so great a value that both the fame of Bell and the wealth of his commercial associates seem but feeble recompense by comparison. In judging to-day what the world has acquired, we must not overlook that the developments have been due to very numerous discoverers and inventors, but these later discoveries and inventions have all been built upon the one foundation. All are consequent upon Bell's "mathematical conception" of the essentials of voice transmission. Bell invented the speaking telephone, and he advocated the adoption of the exchange system, but beyond some further experimental work in the earlier days he did not attempt to pursue any inventive activity in the direction of accessory apparatus. These accessories are immensely important and afford a wide field for admiration—too wide to be more than mentioned now.

The voice of Bell's telephone in 1876 was a still small voice, but it was capable of reinforcement, and has been reinforced. Its range then was short, but capable of expansion. In 1877 twenty miles was regarded as the limit. The expansion has been such that it now overspreads a continent. It may be said that the limits to telephonic transmission are governed by commercial and not scientific conditions. The five thousand five hundred miles so far accomplished can and will be further extended as circumstances require. Whether the distance be five thousand miles or five hundred yards, the value of telephonic communication cannot be adequately appraised as merely the means of conveying information. It is conversation—question and answer—emphasis and inflexion. Commercially or socially it is generally some particular voice that it is desired to hear. The annihilation of space is of value anyway, but when the undulating current transmits a voice one wants to hear, how much more does that trunk call seem worth while?

Fifty years have passed since the world was told how to transmit speech. What has the world profited by it? Perhaps a few approximate figures serve to answer that question in part:—

Telephone exchange stations of the world	... ...	28,000,000
Investment therein	...	£1,200,000,000
Persons employed	...	1,000,000

Of these 28,000,000 stations, more than half have been so designed, constructed, and connected as to permit speech to be interchanged each with the other. "Since the invention of the telephone, it has been the purpose of your company and its predecessor organisations to create and maintain telephone service in any part of the United States for communication with any other parts of the United States." This statement is made to its shareholders by the American Telephone and Telegraph Company, the lineal business descendants of Bell himself, who early adopted this ideal and have steadily pursued it. Parts of Canada are also included within the connecting zone. Geographically and scientifically there is nothing to prevent the telephonic population of the whole American continent being within hearing of each other. It will come some day. The commercial demand will determine when, and I do not propose to hazard a date. But regarding the 7,000,000 in Europe, it ought to be possible to say that intercommunication is already in operation for the principal countries at least. Without doubt the respective administrations will sooner or later throw over "parochial" restrictions, so that any European with a telephone station may talk with any other so provided. I have written in terms of continents, because that is an advance upon the present general tendency (with few exceptions) to consider only national boundaries, but I must guard against giving an impression that I regard the boundaries of continents as any more the limitations of telephone communication than the boundaries of countries. Telephone lines and telephone instruments would make Europe, Asia, and Africa an intercommunicating field, the area and development of which would only be limited by the extent to which such means of communication were economically productive. The early establishment of international telephony through specially-constructed cables to the Continent by the British Post Office was an example of enterprise from the source rather than a concession to public demands.

A new service like that of the telephone exchange had necessarily to go through a period of uncertainty as to the principles upon which it should be conducted. That the public interest would be served by competitive services was imported into the telephone field from prior and dissimilar experience, and a considerable portion of the half century was occupied in demonstrating the fallacy of this view. It is now universally recognised that the public interests are best served by a single organisation regulated by authority.

The development of the service in any locality is much dependent upon the adoption of an enlightened policy by the regulating authority. In many parts of the world development has been retarded by the failure to recognise that an increase in the cost of living without an increase in telephone rates is equivalent to a reduction in those rates, and that failure to increase them must inevitably lead to a situation in which the service ceases to be profitable or may be undertaken even at a loss.

It has long been known and fairly well recognised that the prosperous tradesman gives the most efficient

service to his customer. When D'Artagnan proposed to drink to the prosperity of his host's establishment, the innkeeper was flattered and surprised. "But don't mistake," said D'Artagnan, "there is more selfishness in my toast than perhaps you may think—for it is only in prosperous establishments that one is well received. In hotels that do not flourish, everything is in confusion, and the traveller is a victim to the embarrassments of his host." As a considerable traveller, he wished to see all innkeepers making a fortune.

Public enterprises cannot make fortunes, but that they should pay their way handsomely is much more to the interest of the "consumer" than he imagines. In the telephone service it is especially so because of the considerable and continuous expansion. The addition of new subscribers is of value to those existing by reason of the potential facilities for widened area of communication, but expansion calls for new capital, and new capital cannot be obtained for unprosperous enterprises. The limitation of rates to unremunerative figures, whether by public opinion, by Governments, or public service boards, is fatal to progress. Yet many telephone administrations suffer from this misdirected form of public control which intends the public good, but attains, instead, the public ill, for it is beyond question that the larger the number of telephone stations the more efficiently and economically is the commercial and social work of the community carried on. Retardation from unremunerative rates accounts in some measure for the meagre expansion in some parts of the world where the subscriber "is a victim to the embarrassments" of the suppliers.

But in the half century since the birth of the telephone, we have seen many misunderstandings removed. Where other misunderstandings exist, they will give way sooner or later to the logic of reason and the lessons of experience, so that the widest use may be made of Bell's discovery and invention. This widest use cannot be made without additional investment, and it is to encourage such new investment that prosperity is required.

The figures given above take no account of the employment and investment in manufacturing or wireless uses. Manufacturers of apparatus, wires, and cables will immediately occur to the mind, but in fact scarcely any branch of industry is outside the scope of expenditure of the Telephone Administration and its employés. There are employments and employments, but that which contributes to the welfare of the community, whilst providing a livelihood for the individual, must always be the source of the greatest satisfaction. Is there any public service which gives so great advantages at so small a cost as the telephone?

Whilst the exchange service is the outstanding practical result of the invention, the value of the telephone as a scientific instrument must not be overlooked. It was promptly used as an indicator of weak currents, and thus early led to the discovery by Hughes of the microphone, the most effective instrument for producing the variation of current specified and claimed by Bell, and one of the means of extending the distance of speech transmission. Though indicating the use of a battery with apparatus for varying the resistance, Bell used the "inductive method" in his instruments. Articulation was perfect, power feeble. Battery with microphone prevailed because articulation was good enough and power much greater. The only known place for power then was at the transmitter. It is of interest at this date to note that the wireless demand for the utmost purity of articulation has tended to the production of a transmitter on the "inductive method" Bell originally used, since power can now be added to the circuit apart from the transmitter. The transmitter originates and amplifiers "carry on." In telephonic partnership sound and electricity have made exceptional scientific progress—promptly applied to practical results both in wired telephony and that wireless transmission which is literally as familiar as household words to the world at large.

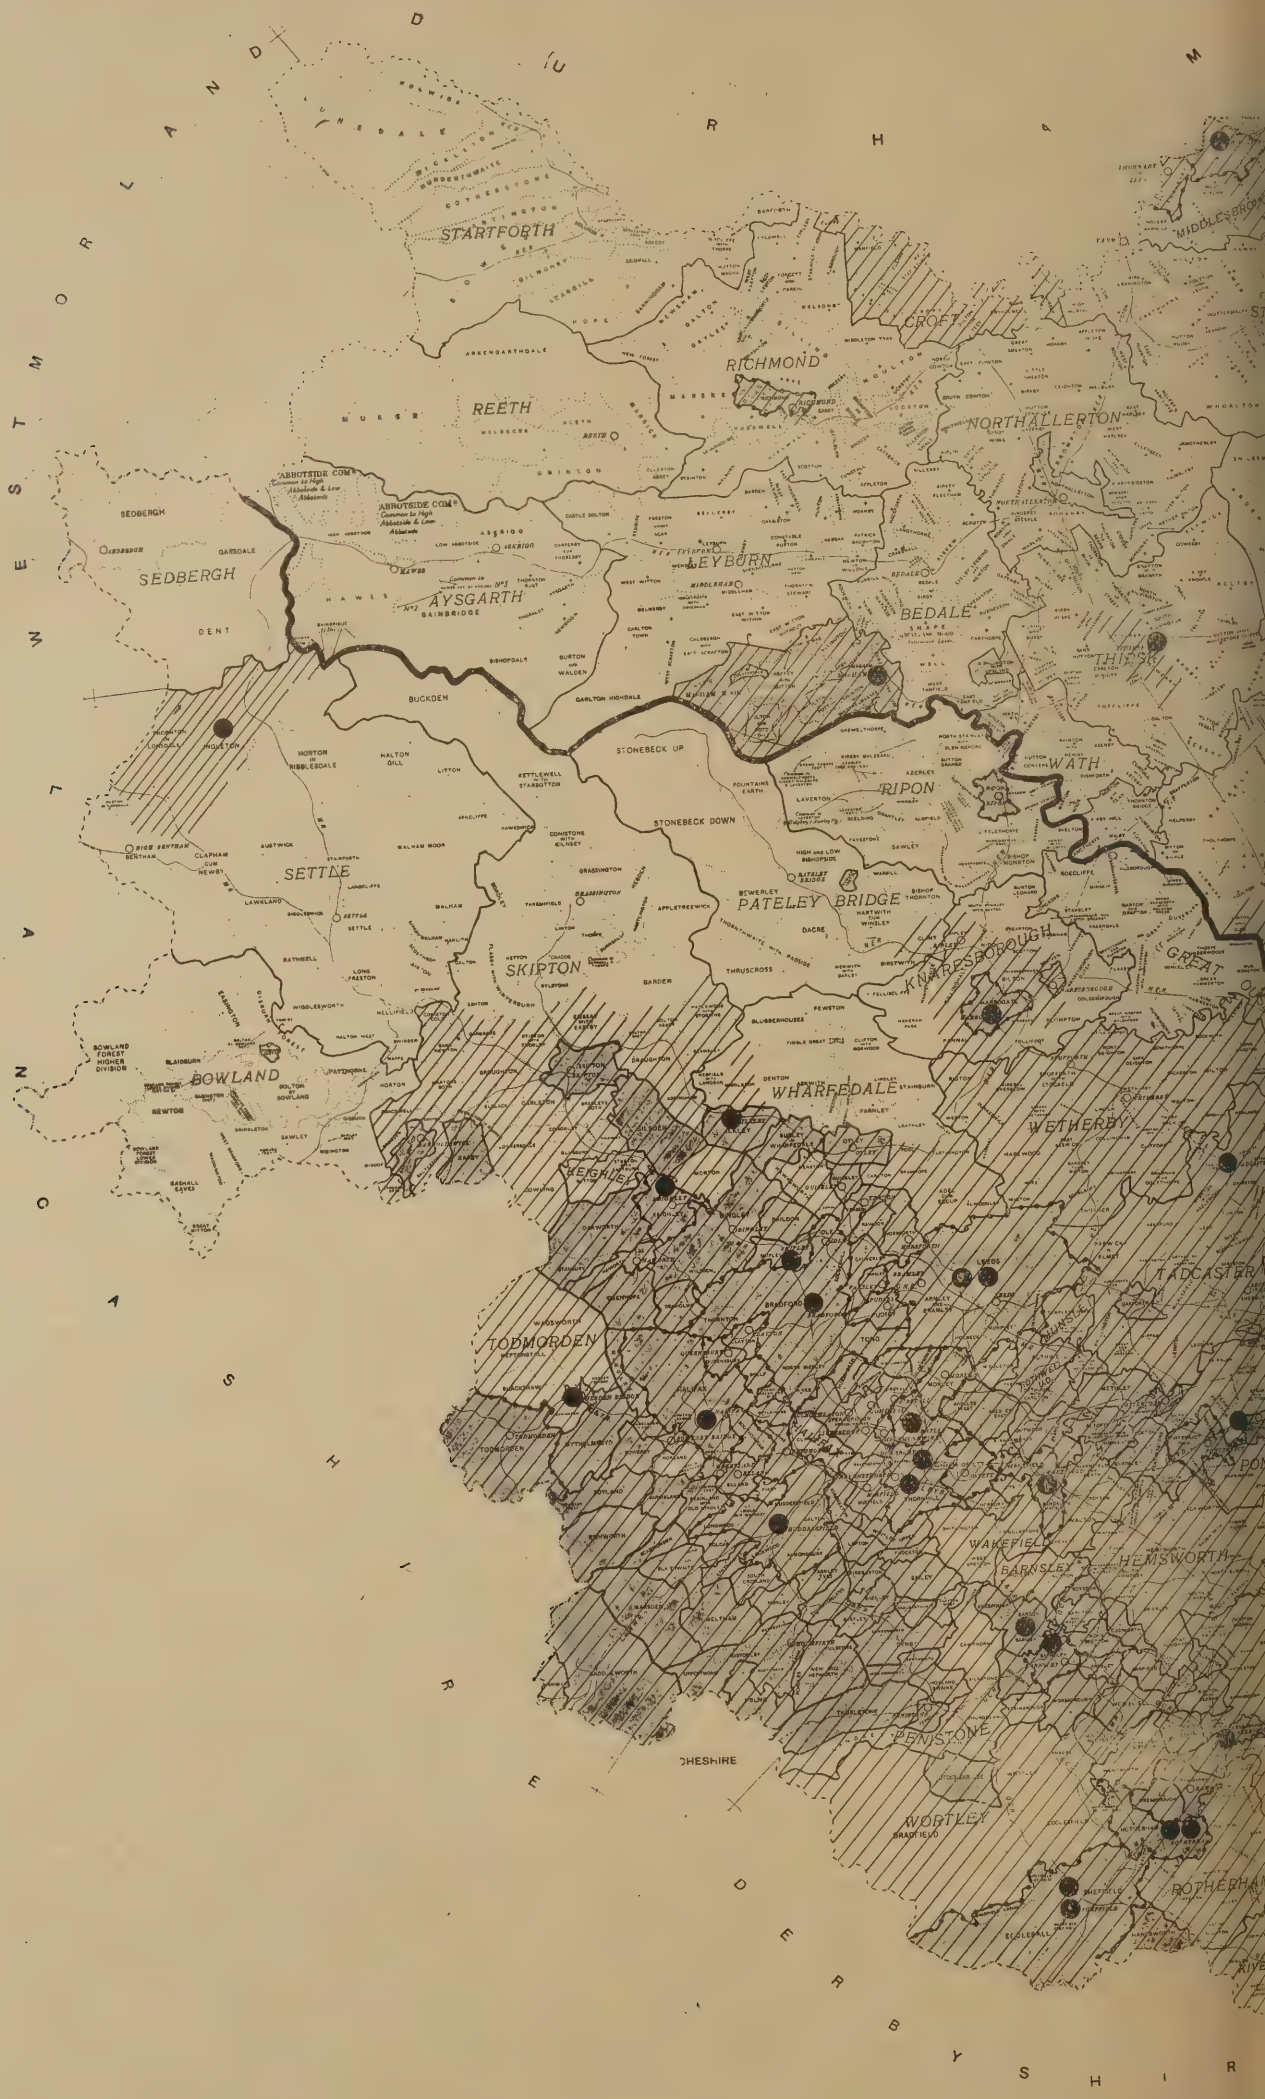
A word as to the future. The comparison of telephones to population is a familiar one. Not so long ago telephone men talked of the "saturation point," and looked for signs of its being reached. But no such signs are to be seen, and telephone men are now inclined to wonder whether, in some localities at any rate, the population will continue to exceed the number of telephone stations or the stations exceed the population! That, however, is for the distant future to decide. As to the immediate future, there can be little doubt that the 70 per cent. world's increase of the last ten years will be converted into 100 per cent. in the next ten years. In many parts of the world the telephone has penetrated only the top stratum of society. It must go deeper. Its threefold economy of time, labour, and money is too great to be neglected.

On his last brief visit to London, Bell attended a meeting of the Wireless Section of the Institution of Electrical Engineers. None then present will forget his leonine head, his modest mien, his tribute to others who had furthered telephonic enterprise, and his encouragement of those younger members—wireless and others—in whose hands the future lay. Since then he has been gathered to his fathers, but his work lives. It falls to those younger men at a time when the telepone is no longer a novelty, when the halo of romance surrounding it is less observed, to extend in various ways its practical applications until a much larger percentage of the world's inhabitants are in a position to utilise those "electrical undulations similar in form to the vibrations of the air accompanying vocal sounds" described by Alexander Graham Bell in the patent granted to him on March 7th, 1876.

Electricity Supply in Great Britain.—XII.

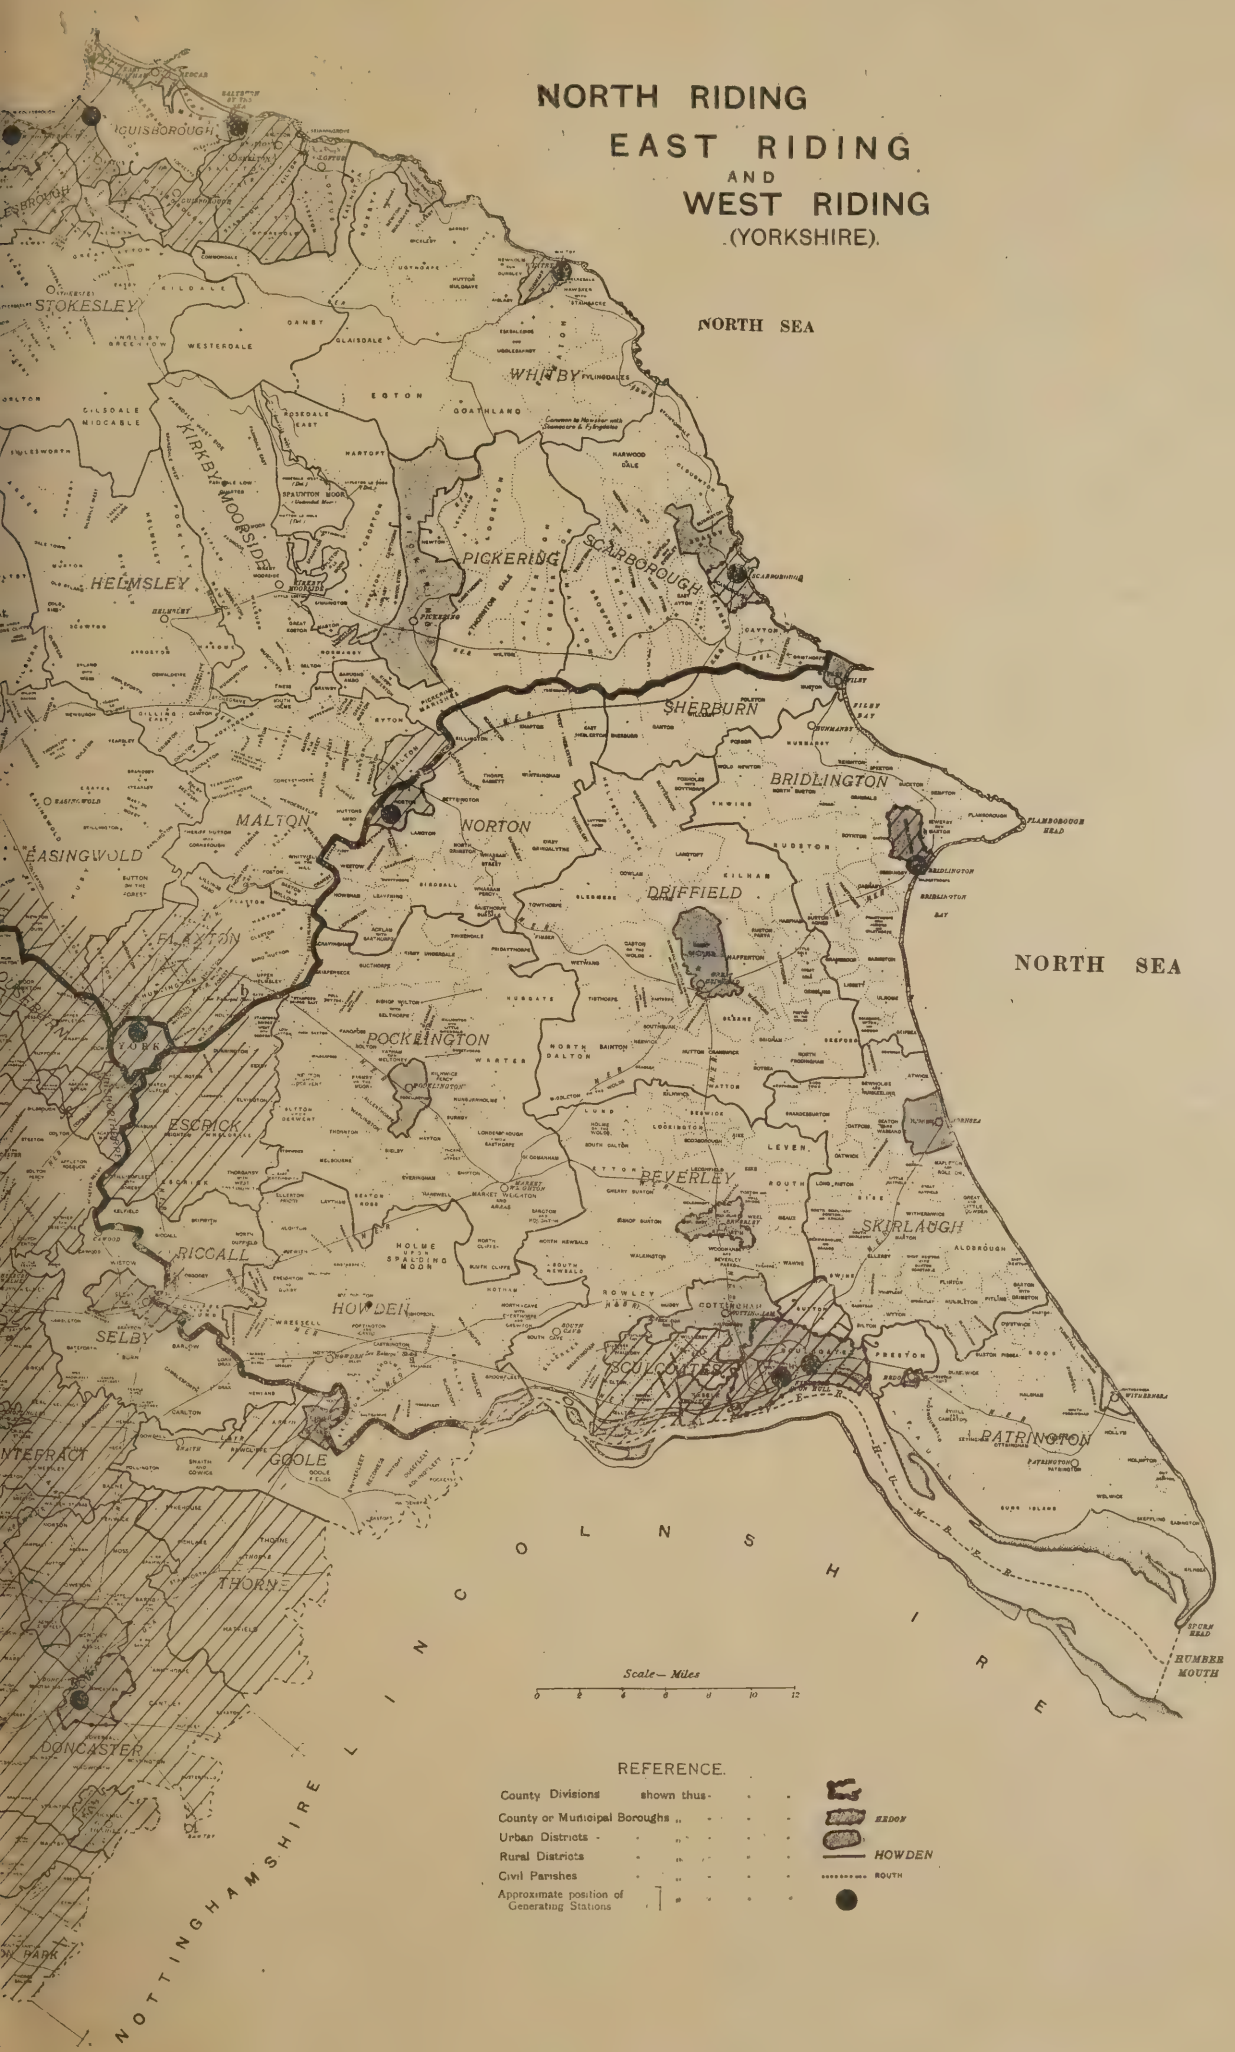
Yorkshire.

Yorkshire occupies more than one-tenth of the area of England and Wales, and is composed of the three Administrative Counties of the East, North and West Ridings, with their eleven associated County Boroughs, and the City and County Borough of York, which for administrative purposes is regarded as a County of itself and is not connected with the Ridings.



The 1921 Census gives the following figures for each of the Ridings, with their associated County Boroughs, and for the City of York:—

	Acres.	Persons.	Resident families.	Buildings not containing dwellings.
E. Riding ...	750,115	460,880	104,075	7,128
N. Riding ...	1,362,058	456,436	97,859	6,568
W. Riding ...	1,773,529	3,181,174	749,173	54,541
City of York	3,730	84,039	19,020	1,057
Total ...	3,889,432	4,182,529	970,127	69,294



The accompanying map has been hatched to show the occupied and applied-for areas in respect of statutory powers for general supplies of electricity.

The Cleveland and Durham County Electric Power Company's area extends into the North Riding, but this has not been shaded, as the statutory powers do not authorise general supplies. Similarly, the area of the Yorkshire Electric Power Company is not hatched, except where statutory powers for general supplies are held or have been applied for.

Figures for the kWh generated for Yorkshire as a whole are not readily available. The output of the generating stations in the North and East Ridings, together with that of York, Harrogate and the Ingleton E. L. & P. Co., Ltd., is included with the output of the generating stations in the North-East Coast District, which is Area No. 16 of the Electricity Com-

Electricity Supply

of Yorkshire.

missioners' publication, "Generation of Electricity in Great Britain."

The output of the remaining generating stations in the West Riding can be obtained by combining the totals given for Area No. 4 and Area No. 9 in Table 8 of the above-mentioned publication. (It should be noted that the output of the generating stations of Chesterfield and Worksop is also included in Area 9.)

For the sake of comparison, the totals of Area No. 3, which is the South-East Lancashire Electricity District, are also given below:—

Year ending March 31st.	kWh generated. Areas Nos. 4 & 9.	Area No. 3.
1922	458,998,118	536,232,207
1923	559,249,179	647,284,355
1924	656,616,641	741,676,570
1925	691,270,702	838,793,340

It is evident that the rate of increase for the West Riding has not been so fully maintained as in No. 3 Area.

The following is a list of existing authorised undertakers, whose areas are wholly or partly in Yorkshire. The names of two Corporations and five Urban District Councils are shown in heavy type; in these instances it has been decided to dismantle the generating station and take a bulk supply:—

Local Authorities.

Adwick-le-Street Urban District Council.
Baildon Urban District Council.
*Barnsley Corporation.
*Batley Corporation.
Bingley Urban District Council.
*Bradford Corporation.
*Bridlington Corporation.
Brighouse Corporation.
Dearne District Electricity Board.
*Dewsbury Corporation.
*Doncaster Corporation.
Elland Urban District Council.
Eston Urban District Council.
Guisborough Urban District Council.
*Halifax Corporation.
*Harrogate Corporation.
Haworth Urban District Council.
*Hebden Bridge Urban District Council.
Heckmondwike Urban District Council.
Holmfirth Urban District Council.
Honley Urban District Council.
*Huddersfield Corporation.
*Ilkley Urban District Council.
*Keighley Corporation.
*Kingston-on-Hull Corporation.
Knaresborough Urban District Council.
*Leeds Corporation.
*Masham Urban District Council.
*Mexborough Urban District Council.
*Middlesbrough Corporation.
Mirfield Urban District Council.
Morley Corporation.
New Mill Urban District Council.
Normanton Urban District Council.
Ossett Corporation.
Pudsey Corporation.
Redcar Corporation.
*Rotherham Corporation.
Scarborough Corporation.
*Sheffield Corporation.
*Shipley Urban District Council.
Skelton and Brotton Urban District Council.
Skipton Urban District Council.
Slaithwaite Urban District Council.
Spenborough Urban District Council.
*Stalybridge, &c., Electricity Board.
Todmorden Corporation.
*Wakefield Corporation.
*Whitby Urban District Council.
Whitwood Urban District Council.
*York Corporation.

Companies.

Cleveland and Durham County Electric Power Co.
Electrical Distribution of Yorkshire, Ltd.
Ingleton Electric Lighting and Power Co., Ltd.
Northern Counties Electricity Supply Co., Ltd.
Scarborough Electric Supply Co., Ltd.
Tadcaster Electricity Co., Ltd.
Yorkshire Electric Power Co.
Yorkshire (West Riding) Electric Tramways Co., Ltd.

Although the Newcastle-upon-Tyne Electric Supply Company has not been included in the above list of authorised undertakers, it should be noted that the Acts of this company empower it to supply energy, *inter alia*, to the North-Eastern Railway Company.

Applications for Electricity (Extension) Special Orders have been lodged by the following local authorities:—

Bradford Corporation.
Bingley Urban District Council.
Darlington Corporation.
Keighley Corporation.
Leeds Corporation.

Richmond Corporation has applied for a Special Order, and the Electrical Distribution of Yorkshire, Ltd., has nine applications awaiting approval.

The accompanying map was prepared by the Ordnance Survey Department for the 1917 Boundary Commission, and is reproduced by permission of the Controller of H.M. Stationery Office. Since 1917 many alterations to areas, &c., have been made, of which particulars are available if required.

*Local authority undertakers owning generating stations.

Wireless and the Electrical Trader.

By PAUL D. TYERS.

One is frequently told that the electrical trader is somewhat afraid of wireless as an integral part of his business. It seems a little peculiar, perhaps, since wireless is essentially a hundred per cent. electrical that many electrical retailers should approach it in rather a half-hearted way. A little fuller investigation of the subject, however, soon shows us that there has been very good cause for the electrical trader to approach wireless with more than ordinary caution. The inauguration of a regular broadcast service produced chaotic conditions in the wireless industry, if we may term it such at that time. Manufacturers soon began to flood the market with anything and everything that was "wireless," and, moreover, apparatus was to be found in the windows of retailers of almost any class of goods all over the country. It must have been a little disconcerting to the electrical trader to find that a photographer, perhaps, in the same street was filling his windows with wireless goods and obtaining full trade discount.

When the first novelty of broadcasting diminished, the somewhat chaotic conditions began to sort themselves out. The public became more critical, and only the best apparatus found a ready market. To-day, the semi-technically educated public are beginning to find that they cannot expect to obtain intelligent service from the retailer of wireless apparatus unless he happens to be in the electrical trade.

Obviously, then, the wireless trade by its very nature is forcing itself into the hands of the electrical contractor and dealer. That the retailing of wireless components and sets is a profitable undertaking is indisputable, and its successful development will lie in the hand of the electrical retailer.

There may be some who doubt the truth of this statement, but no better indication can be found of the trend which the wireless industry is taking than in the marketing of the General Electric Co.'s radio valves as the "Osram valves." Everybody knows the Osram lamp, and the wireless public are now being made to remember the "Osram valve"; and they will naturally go to the electrical dealer. So far as the sale of ordinary electrical fittings is concerned, the dealer knows that to maintain the support of his customers he must sell them the right article, give them good service, and also be in a position to advise them in their purchase. This, of course, presents no difficulty, since, almost without exception, the retailer thoroughly understands the apparatus which he is selling.

In the case of wireless components and sets, this aspect of the problem is far more difficult, since the technical side of wireless is admittedly more complicated and also strange to the average dealer, unless, of course, he happens to have specialised in wireless as an amateur experimenter. It means, then, that the dealer must exercise considerable care in advising his customers what to buy and how to use it. It is quite conceivable that any haphazard sale of, perhaps, the wrong type of condenser or transformer may arouse the displeasure of one of his best customers, with the result that not only is he likely to lose any further wireless business, but his ordinary electrical trade may also be jeopardised.

It should not be imagined, however, that anything in the nature of a highly technical knowledge is necessary in order thoroughly to understand the selling of wireless apparatus. Experience shows that the queries raised by prospective buyers are almost invariably connected with some few dozen particular points, and it is with these subjects that the trader should become perfectly familiar. By so doing he will gain the confidence of his customers, and soon earn a reputation which should do much to strengthen the foundation of a really good retail wireless business, which happily must sooner or later improve the electrical side still further. With this end in view, it is hoped to discuss in these columns some of the more important technical problems which are likely to arise.

The British Industries Fair.—IV.

Electrical Features and Meetings.

Visit of Contractors and Wholesalers.

On February 24th members of the Electrical Contractors' Association and the Electrical Wholesalers' Federation paid a visit to the British Industries Fair, at Castle Bromwich, Birmingham. The attendance was of a representative character. At the invitation of the Management Committee of the Fair, the party lunched together, and at this function Mr. T. R. Martin, vice-chairman of the Fair Management Committee, said that the organisers had not only got manufacturers to exhibit, but had actively assisted in the bringing of buyers to the Fair. They felt that nothing was more likely to conduce to bigger and better business than to bring producer and buyer once a year into personal contact. The Committee felt that the electrical industry had, for too long, been out of this great movement for the general betterment and world expansion of British trade. They felt confident that having once started they would now go on, year after year, making the electrical section larger and larger until they succeeded in attracting to this country once in every year buyers from all parts of the world. The more rapid its growth, and the greater and more representative its exhibits became, the more quickly would the buyers come, and, for that reason, they hoped that the electrical industry, having once made a serious start, would go on, and that it would take its proper place and share in this movement for making England, for one fortnight in every year, the market of the world. The Fair was now firmly on its feet, and, from the applications and inquiries already received, it was obvious that considerable extensions would be necessary, they were indeed already under consideration for next year's Fair. He expressed the hope that manufacturers, who intended to show next year would give to the Fair Committee an early notification of their space requirements.

Mr. H. H. Berry, in submitting the toast of "The Electrical Industry," said his experience at the present Fair had been most encouraging, and he saw no reason why the concern with which he was identified should not exhibit for some years to come. He looked upon the Exhibition, if it were properly done, as likely to become a milestone in the development of the electrical industry. His hope was that each milestone would become more important; and that support, so far as the Fair was concerned, would be forthcoming from the great and ever-growing electrical industry.

Mr. Alger (president of the E.C.A.), in reply, humorously observed that he was not expected to make a pronouncement against municipal trading, although he considered that anything which tended to destroy private enterprise should be strenuously opposed. As an Association they stood for quality, efficiency, and service; and it was part of their trade policy, as far as possible, to push only British manufactured goods. He congratulated the authorities upon the wonderful exhibition which they had got together; a visitor to the Fair would not believe that Britain was "down and out." If we turned to work seriously in all departments, we need not fear competition from any country.

Mr. A. Holman, president of the E.W.F., said that he felt that the only way of advancing our export trade was by holding these Fairs, year after year, without a break. British manufactured goods were the best, taking everything into account, and he trusted that the Fair would be the means of attracting to London and Birmingham buyers from all parts of the world. As this country depended largely for its existence on export trade, he was satisfied that British manufacturers would manufacture precisely the kind of goods that were wanted overseas; it seemed to him it was only a question of organisation in bringing the Colonial and foreign buyers to this common centre.

Colonel Cole, Director of Exhibitions, Department of Overseas Trade, also replied, observing that that was the seventh occasion on which he had been to Castle Bromwich. He thought they would feel that this Fair movement was only in its infancy. We in this country were slow in taking up new ideas, but this modern type of fair was quite different from the old-time fairs. They of the Board of Trade had a great responsibility in trying to bring to this country as many overseas buyers as possible, and through the various services of the Department they were doing their best to develop export trade. It was not easy to appreciate how rapidly some parts of the British Empire were growing, but it was the desire of the Board of Trade to place its services at the disposal of the business and commercial community. Referring to the recent Exhibition of Decorative Art in Paris, he said that it taught one outstanding lesson: the enormous development in electric lighting. Paris on the occasion to which he referred offered a real object lesson to those engaged in the English electrical industry.

The electrical trade representatives then made a very thorough tour of the electrical section of the Fair.

The Electrical Association for Women.

This Association held a meeting on February 23rd, at the Birmingham Fair, for the purpose of inaugurating a branch in the Midlands. Lady Brooks was in the chair, and Miss Haslett, director of the Association, explained the objects of the organisation, emphasising the need for greater knowledge amongst women of things electrical. Those who were fortunate enough to possess electricity in their homes needed education in electrical "first aid," while for others a demonstration of the value of electrical labour-saving devices was the essential. This instruction would become available to the women of the Midlands if a branch of the Electrical Association for Women was formed there. Miss Haslett emphasised the need for the improvement of the hire system of expensive electrical apparatus, and the value of electrical instruction to girls at school.

Mrs. Lawson, local hon. secretary, announced that it was hoped to hold a large meeting in two or three weeks' time, and as a result of her appeal to those present to become members a large number of local ladies were enrolled during the afternoon.

Mr. Chattock, the city electrical engineer, gave the new branch a very warm welcome, and promised advice and assistance wherever possible. He spoke of the need for an educative movement in the proper use of electricity and the best way of applying it, and said that he wanted the ladies of Birmingham to take an interest in the greater use of electricity for domestic purposes.

Miss Griff, A.M.I.A.E., moved a resolution inaugurating the local branch, and this was seconded by Mrs. Howie, of Walsall. After an open discussion it was decided to call the

branch "The Birmingham and Midland Branch of the Electrical Association for Women."

The meeting concluded with an interesting report from Mr. Dean, on behalf of Mrs. George Cadbury, of an experiment at Bournville. Three houses had been built of the same standard, but fitted, respectively, with (*a*) coal fires, gas cooker, and electric light; (*b*) all-electric fires and lights except in the kitchen, which had a coal range, for cooking and heating water; and (*c*) electricity throughout, no coal fire at all. The last-named was proving rather difficult to dispose of. Careful records were to be kept in these houses for the next 12 months of all expenses connected with heating and lighting (even the cost of chimney sweeping and ceiling painting) so that due comparison could be made.

At the close of the meeting members visited the stands and were then entertained by the Fair authorities to tea; later in the evening members were invited to a reception at the Town Hall, given by the Lord Mayor.

Lady Brooks was elected as president of the branch, Mrs. Lawson as hon. secretary, Mrs. Chattock and Mrs. Beale as vice-presidents, and amongst those elected to the Council were the following:—Mrs. Howie (Walsall), Mrs. S. T. Allen (Wolverhampton), Mrs. Muncaster (Leicester), Mrs. Forrest, Mrs. Garrard, Mrs. Tucker, Mrs. Jennings, Mrs. Martin, Miss M. F. McDonald, Mrs. Collard, Miss C. Griff, Miss E. D. Lockley, Mrs. H. L. Wood, and Mrs. Boyes.

Stands at Castle Bromwich.

We have already reproduced photographs showing examples of the types of stands erected by exhibitors or their contractors in Building C of the Castle Bromwich Aerodrome. As a further guide to prospective participants in future fairs we illustrate herewith four more typical examples. The first (Julius Sax & Co., Ltd.), shows how advantage has been taken of a small space to exhibit a wide range of accessories. The second (Young, Osmond & Young, Ltd.), illustrates the effective use of a large space to show a single idea—the "Lightfoot" tubular heating system. The third example (the Chloride Electrical Storage Co., Ltd.), is a corner stand, and the fourth (Berry's Electric, Ltd.), is a double stand with a room at the rear for demonstrating the effects of electric fires.

Allen-Liversidge, Ltd.

Among a collection of apparatus, examples of "Pontelec" welders and rivet heaters were shown. One of them—the No. 10 spot welder, which was demonstrated, is capable of continuously welding wrought iron or mild steel up to ¼ in. added thickness, or ⅜ in. occasional working, and weldable brass up to 3/22 in. added thickness. It is strongly constructed, fitted with water-cooled electrodes having renewable tips and a swivelling pressure pedal adjustable to any angle up to 30 deg. The heating control provides for eight different degrees of heating for varying thicknesses of material. A trip switch automatically cuts off the current immediately the weld is completed. The machine is rated at 6 kW. A 15-kW rivet heater was shown, and it was demonstrated that the rivet was heated from the core outwards, so that the head was least affected. An 8-heat control plug device is provided, and the machine is provided with three heads, each with its separate operating pedal. Another machine on view was a 30-kW butt welder.

Smith & Paget, Ltd.

A number of washing machines and wringers were exhibited by this company; among them was the "Northern Crown" electric washer and wringer. The clothes container in this machine is a cage of perforated pitch pine operated by a patent reversing motion giving 1½ revolutions in each direction alternately. The wringer provided is of substantial propor-

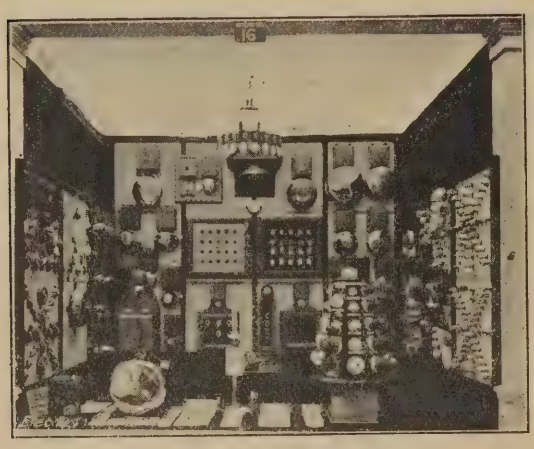


Fig. 15.—Julius Sax & Co., Ltd.

Fig. 17.—Chloride Electrical Storage Co., Ltd.

Fig. 18.—Berry's Electric, Ltd.

Representative Examples of Stands at Castle Bromwich.

tions, and is driven by guarded chain gears from a small motor which operates the clothes container. Another design of washer was the "Crown Capital" machine, which is of the dolly type, the dolly being operated by a ¼-h.p. motor.

Crossley Bros., Ltd.

A number of running engines were displayed upon this stand. The largest was a 31-b.h.p. horizontal, cold-starting oil engine, designed for operating an electrical generator. It can employ the cheapest grades of fuel oil, but it is also suitable for higher class oils. It has a moderate compression pressure and the fuel consumption is said to be only .45 lb. per b.h.p.-hour at full load when using furnace oil. The fuel admission is on the solid injection principle, the pump delivering oil through a special sprayer nozzle. Another engine shown was the Crossley vertical 2-stroke crude oil engine, with a capacity of 14-b.h.p. normal working load. The special features of this type of engine are an air scavenge pump and a system of forced lubrication to all working parts. The

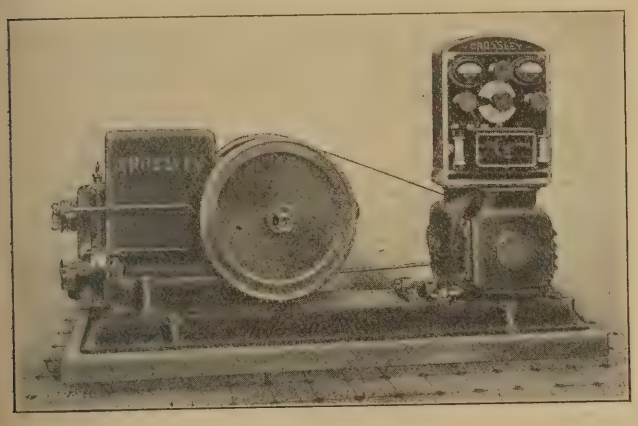

Fig. 19.—A Crossley Lighting Set.

fuel consumption on furnace oil at full load is .57 lb. per b.h.p.-hour. An entirely new production which was shown is the 1½-kW electric lighting set illustrated in fig. 19. This set comprises a 3-b.h.p. horizontal paraffin engine, totally enclosed, with automatic lubrication, belt driving a 50/70-volt dynamo, upon which the switchboard is mounted. The set is erected upon a substantial base, as will be seen from the illustration; this base contains the fuel supply. Water cooling is provided by a fan-cooled radiator attached to the engine water jacket. This set is also made in the following sizes:—¾ kW, 1 kW and 1½ kW. It is arranged for battery charging for country house lighting, etc.

Berry's Electric, Ltd.

The well-known "Magicoal" fires formed the *pièce de résistance* of this exhibit. Upon the stand was a lounge in which several of these in various "period" styles were arranged. At one end of the stand was an "Ironsafe" switchboard which is one of the firm's specialities. Distributed about the stand were examples of "Mulparvo" heaters, which,

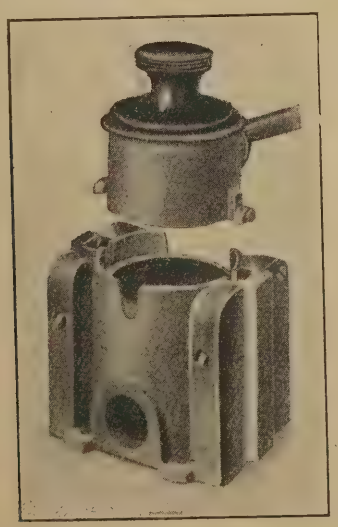

Fig. 20.—The "Konform" Switch-plug.

as their name implies, serve a number of purposes in the heating and cooking direction. Other exhibits were an effective revolving illuminated advertising device and a shaving mirror into which an electric lamp is fitted to direct light upon the face. A recent production exhibited was the "Konform" ironclad switch-plug designed for use with trailing cables, portable tools, &c. This device, which is illustrated in fig. 20, has a quick-make and quick-break switch action which is independent of the operator. It is impossible to make an incorrect sequence of contacts, and there is no separate switch handle to operate. All live parts are enclosed and the contacts submerged when the plug is withdrawn and the operating springs are kept well away from the switch contacts. The latter are of a substantial blade and clip form. Earthing is provided for on both parts.

Upon this stand, also, was a selection of electrical instruments made by Messrs. Nalder Bros. & Thompson, Ltd.

Julius Sax & Co., Ltd.

The principal articles exhibited by the company were "Sax" rubbing contact bells, capable of ringing upon from 2 to 250-V d.c. or a.c., in sizes of from 2 in. to 12 in., and suitable for domestic use, as alarms of various types, for railway signalling, &c. A number of indicators of all kinds were shown, as well as other bell accessories and materials. A very wide range of wall plugs formed another section of the exhibit, which is illustrated in fig. 15, and there was also a candle fitting capable of being adapted to any size of sconce, and numerous lampholders, switches, &c.

Atomised Fuel and Engineering Co., Ltd.

Pulverised fuel is usually considered suitable for large installations only, but this company exhibited a plant which can be suitably employed in situations where the consumption is less than 25 tons per day. The "Atomiser" consists of a complete pulverising and firing equipment, self-contained on a single baseplate. The pulveriser has two stages which successively granulate and pulverise the coal. The coal, which should not be larger than 1¼-in. cube, is delivered into a hopper and is fed by an automatic feeder into a breaking-down chamber, where it is rapidly reduced to a granulated condition by an impact rotor, consisting of beater arms fixed radially to a shaft. When sufficiently granulated, the coal is drawn to the inlet of a grinding rotor, and is discharged through ports on to a grinding ring, where it is ground to a fine powder by grinding balls, which are carried round by the rotor, and kept in contact with the grinding ring by centrifugal force. While these operations are going on, a current

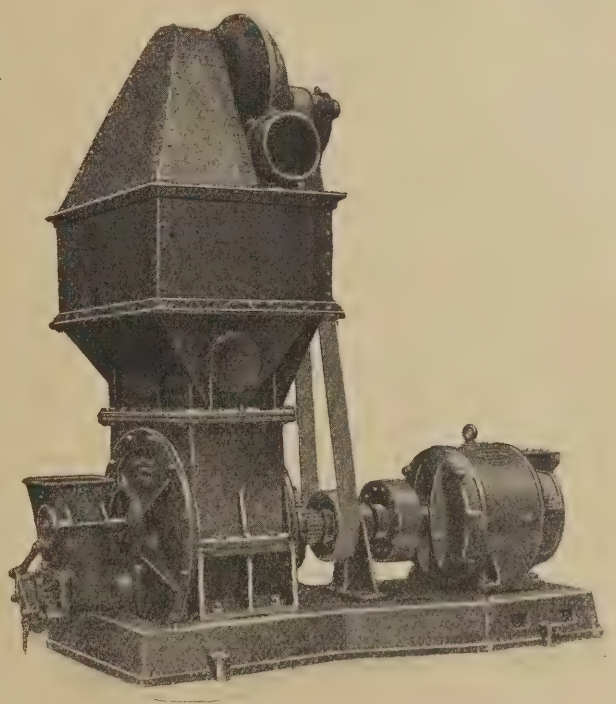

Fig. 21.—The "Atomiser" Pulverised Fuel Equipment.

of air is induced through the machine by a fan. Part of this air enters with the coal, but the major portion enters at an air inlet. As the finely-ground coal leaves the grinding ring it is lifted up by this current of air and is carried into an air-separation chamber; the dust-laden air expands in filling this larger volume and in doing so precipitates the coarser particles, and these fall by gravity through a passage into the machine for re-grinding, whilst the finest product only is carried forward by the fan to the burners. On the discharge side of the fan is fitted a valve, by means of which the air admitted to the machine is controlled, and by this means the fineness of the product can be regulated at will. The equipment is made in three sizes with capacities of 5-10, 20-30, and 30-40 cwt. per hour. The plant is illustrated in fig. 21.

Coley & Swinnerton, Ltd.

Among the appliances shown by this firm were "Electric Perfection" and "Savex" cookers. These are of a fairly light construction and consequently low in price. They are fitted with one, two or three boiling rings as required, and are of ample dimensions for average domestic use. Another exhibit was the "Savex" electric wash boiler consisting of a 10-gallon tank with a 2-heat arrangement, giving 175 W for continuous running and 2,800 W for speedier water heating.

The Hewittic Electric Co., Ltd.

This company's principal exhibit formed part of the special arrangements of the exhibition. This was a mercury-arc rectifier sub-station, comprising eight 100-A units feeding a 3-wire system. The sub-station was fed from the 5,500-V mains of the Birmingham Corporation, the supply being stepped down by two main transformers made by the Hackbridge Electric Construction Co., Ltd. By means of a simple arrangement of three switches, complete isolation may be obtained at any time upon the a.c. or d.c. sides, enabling inspection and repair to be carried out while the other rectifiers in the same bank remain on load. The whole of the gear forming the rectifier proper is enclosed in a sheet steel cubicle, making a compact unit, the instruments, switches, circuit breaker and voltage regulator control being mounted on the front panel. A door is provided in the front, giving access to the fuses, and a lift-off panel at the back facilitates inspection. One of the main advantages of the mercury vapour rectifier over other forms of converter is its relatively high and constant efficiency through a wide variation of load. A view of the sub-station appeared in our last issue (fig. 8, p. 330). The company also showed its "Service Light" system. This employs a tube of incandescent gas 50 in. long and 1 in. in diameter, giving a wide distribution which is claimed to be glareless, and thus there is no need for any form of diffuser. An efficiency of three candles per watt is claimed for this system, as compared with about 1.5 candles per watt for gasfilled lamps. The intrinsic brilliancy is less than 20 candles per square inch as compared with several thousand in the case of the gasfilled lamp. Another one of the firm's manufactures which was shown was the Hewittic-Levick "Ulviarck" lamp, for electro-medical purposes. This gives a light rich in ultra-violet rays and is useful in the sunlight treatment which is coming into extensive use in hospitals, particularly for the treatment of children.

Ruston & Hornsby, Ltd.

Four representative machines of this company's manufacture were shown. The first was a cold-starting horizontal oil engine developing 130 b.h.p. This is designed to run without alteration on a wide range of fuel oils, and it is claimed to start from cold under any conditions. This type is made in sizes from 16 to 340 b.h.p. The engine was shown in operation, as was also a two-stage air compressor of the type used for charging self-starter air receivers, with a working pressure up to 300 lb. per sq. in.; this is water jacketed, self-lubricating, and starts on petrol and continues on paraffin. The other exhibits were stationary—one was a 3-cylinder vertical oil engine (45 b.h.p.). This possesses many of the characteristics of the horizontal type, but has the virtue of occupying less space. It is made in sizes up to 1,000 b.h.p. The Ruston patent "Thermax" boiler which was shown, is a vertical boiler which, by reason of the special arrangement of tubes, is said to give a much higher efficiency than the ordinary vertical cross-tube boiler. The saving of fuel is claimed to be at least 20 per cent., and it is pre-eminently suitable for installation in positions where space is limited.

The "Ceag" Miners' Supply Co., Ltd.

Among the exhibits of this company was a 4-V lamp to provide more than four times the light obtainable from a 2-V lamp, although it is less than twice the weight of the latter. It has been largely adopted by colliery companies for use at the coal face. Another type of miner's lamp on view was an experimental lamp in which the bulb is carried in a swivelling head, and by the use of a scientifically-designed reflector and lens, a very large percentage of the total light is concentrated into a wide-angle beam, which can be directed on to the work. The swivelling arrangement consists of an adaptation of the universal ball joint to enable the light to be shown in any direction without the use of connecting wires. This ball is divided and insulated, and contact is made through the centre of the bulb. Another clever and useful type of lamp which was seen, was a gas-detecting lamp. Upon this is a small oil chamber with a wick ignited by a platinum wire. The wire is carried above the wick by the supporting columns, which perform the double purpose of carrying the chamber and of conducting the current from the accumulator to the platinum wire. The insulating plate in the lamp is divided so that in one position the standard bulb is illuminated, giving light for general use. A turn switches off the light, and a further movement causes the current to flow through the platinum wire, heating it and so lighting the oil lamp. It is said that the oil flame can detect from 1½ to 5 per cent. of gas. A quick-action lid was fitted to a number of these lamps; this enables the electrodes to be readily removed from the accumulator case. Three peculiarly shaped lugs rise out of corresponding recesses in the case when the lid is twisted, so freeing the electrodes. When the lid is pressed on, these lugs drop into position, definitely locating and securing the lid and the case together.

"M. K." Electric, Ltd.

Plugs and sockets and switches of various patterns formed the bulk of this company's exhibit. There was a complete range of 2- and 3-pin plugs and sockets, surface and sunk types embodying the continuous ring spring "Multi-Kontact" sockets, from which the firm derives its name. Foot-press switches for use with radiators were shown; these have largely taken the place of the American rotary types. Combined switch plugs for heating circuits in various types and finishes were displayed, including inter-locking patterns which are foolproof, and conform fully to Home Office regulations and the I.E.E. Rules. Complete control panels for electric cooking and heating installations; teak-cased fuse boards of H.O. design, suitable for 5 to 20-A circuits and a patent double surface safety plug were shown and demonstrated. The last article is a reducing adaptor enabling a fire or other appliance taking a heavy current, to be run from the same point simultaneously with a kettle, iron, or other lighting appliance, the light circuit being protected by a sub-replaceable fuse. Tumbler switches and tumbler switch plugs were shown by the company for the first time. These are rated at from 5 to 7 A. The switch is designed on the same general lines as the well-known foot-press switch. It has a long positive quick-make and quick-break action and the contacts are of phosphor bronze and long and flexible.

Hackbridge Electric Construction Co., Ltd.

The interior of a transformer dominated this stand. The plant is rated at 500 kVA, 3 phase, 50 cycles, 6,600/400 V. It is mesh-star connected and has primary adjustable tappings at plus and minus 2½ and 5 per cent. Samples were shown of bakelite insulation in a number of forms, coil clamping rings, transformer tapping arrangements, 100,000-V bushings, &c.

Gent & Co., Ltd.

This company produces a diversity of equipment, and it required a large stand to display examples of them adequately. One prominent exhibit was an electric turret clock movement, which is capable of driving four 12-in. dials; it is controlled by a master time transmitter. Several patterns of "Pul-syn-etic" clock were shown, including recording apparatus. In addition to these, there was a representative collection of signalling apparatus of various classes, *e.g.*, for mines, on board ship, &c. The telephone apparatus section included several types of intercommunicating telephones and staff locaters, as well as headphones for radio reception. Other radio equipment on view comprised complete receiving sets, loud-speakers, inductance coils, l.f. transformers, &c. An audible as well as visible exhibit was a number of electrically-driven sirens which were occasionally demonstrated.

Waygood-Otis, Ltd.

In addition to a standard electric winding engine (lifting 24 cwt. at a speed of 128 ft. per minute), two hand service lifts, and accessories, this company showed a very handsome working model of an automatic electric passenger lift.

Blackstone & Co., Ltd.

The main exhibit upon this stand was a 100-b.h.p. spring-injection cold-starting oil engine, typical of a range with a maximum output of 900 b.h.p. The "spring-injection" system, it is claimed, ensures a lower fuel consumption, more perfect and prolonged combustion, and the fuel is injected at the same point of the stroke and at the same pressure irrespective of the speed of the engine. This injection mechanism was shown separately. Another engine shown was a new model 5-b.h.p. petrol engine driving a two-stage compressor.

The London Fair.

The General Electric Co., Ltd.

We have already described this company's exhibits at the two sections of the Fair, and a view of its stand at Castle Bromwich has also appeared. In this issue we reproduce a

Fig. 22.—The G.E.C. Stand at the White City.

photograph of the company's stand at the White City, from which it will be seen that the company lent its full support to the Fair.

S. G. Brown, Ltd.

Messrs. S. G. Brown showed a cabinet loud speaker of handsome finish and appearance, having an internal horn of stout

cast aluminium; it is covered by a 12-months' guarantee. In addition there was a display of the company's standard headphones, loud speakers, amplifiers, and other wireless apparatus.

Red Seal Radio Co.

This exhibit consisted entirely of loud speakers, of which two models were shown. These are of simple appearance, free from "freaks"; the cases are sealed, and the instruments are guaranteed without a time limit, provided the seals are not broken. The diaphragms are thicker than usual, and the shape of the horn has been carefully designed.

Eddystone Co.

Besides accessories of all kinds, this company showed short-wave coils for receiving American stations, a 2-valve broadcast receiver for waves from 25 metres upwards, and shock-absorbing feet of Sorbo rubber. All the receiving sets were fitted with front panels of thick glass, and with geared slow-motion condensers.

Gilfillan Bros., Ltd.

The elimination of the battery from radio receivers was the main theme of this firm's exhibit. The Gillan IIx set works directly off the d.c. lighting mains (which, incidentally, also serve the purpose of an aerial within a few miles of the transmitting station). Plate battery pressures from 50 to 160 volts are available when the supply is at 200 volts or more; four filament currents are provided for as well as grid bias from —2 to —10 volts. The battery eliminator unit, which is incorporated in the set above named, can also be obtained separately.

Radio Communication Co., Ltd.

This company had a large exhibit consisting mainly of its marine wireless equipments, rated at 1½, ½, and ¼ kW; a ¼-kW lifeboat set, an automatic call device, and a variety of broadcast receiving apparatus, transmitters, &c., were shown. The 1½-kW ship-and-land station was fitted with continuous wave apparatus, as well as the spark system, and had a daylight range of 800 miles with spark, and 2,000-2,500 miles with c.w. The "Polar Audalion" loud speaker was a notable feature of the exhibit.

Brandes, Ltd.

Amongst the well-known manufactures of this company there were to be seen—and heard—the cone cabinet loud speaker, a neat hornless design; the Brandola; and the little "table-talker," with non-metallic horns. The matched-tone headphones should not be overlooked, and a "distortionless" transformer was shown, with ratios of 5.1 and 3.1.

C.A.C. Radio, Ltd.

Amongst a variety of wireless apparatus, the high-pressure accumulators made by this firm formed a noteworthy feature of the exhibit. The 10-Ah and 1-Ah sizes were shown, each set giving 80 volts; two intermediate sizes are also made. The company is now making its own valves, of several types, which are sold with a three-month guarantee from the date of sale. A portable set having a range of 30 miles on the loud speaker and 50 miles on 'phones, weighing 17 lb., was worthy of note; with an outdoor aerial it has a range of 1,000 miles. Another interesting item was the "Voltometer," a set which takes both h.p. and l.p. supply from the d.c. lighting mains.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The B.E.A.M.A.—The annual luncheon of the British Electrical and Allied Manufacturers' Association will be held at the Connaught Rooms, on March 18th, at 1 o'clock.

Proposed Exhibition at Sydney.—Much work has been done in connection with the proposal to hold an exhibition in Sydney in 1930 to mark the completion of the Harbour Bridge. A committee has been appointed and plans made for a vast gathering, which will also mark the completion of the electrification of the suburban railways and the advancement of Canberra, which should by that time be nearing completion. A proposal, however, has been made that the exhibition be held in Sydney in 1929 instead of in 1930.—*Reuter's Trade Service* (Melbourne).

The Engineering Dispute.—Over 900 men employed by Messrs. R. Hoe & Co., printing machinery manufacturers, have been on strike for some time on the question of the employment of non-union labour. The principal union concerned, the Amalgamated Engineering Union, has refused to recognise the strike, stating that the men should resume work to enable negotiations to be carried on. This action of the union has had no effect, and as a consequence a statement was issued last week by the Engineering Employers' Federation that steps to end the dispute would be taken, to the extent of ordering a national lock-out.

A national lock-out is also threatened by the Federation if unions or district groups attempt to enforce an increase of wages, following upon the abandonment of the national negotiations.

On Friday last the board of management of the Engineering Employers' Federation decided that lock-out notices should be posted in all federated engineering works to-day (Friday), and that they should take effect on Saturday, March 13th. The strike committee of the employés at Messrs. Hoe's works is said to have stated that the threat of a lock-out had no effect upon its determination to abolish non-unionism at the works and to obtain higher wages.

The Swedish Electrical Industry.—*Swedish Export* says that the situation of Sweden's electrical industry greatly improved during 1925. The home market was certainly rather dull, but the demand from abroad improved considerably. Competition was severe, but on the whole Swedish manufacturers were able to retain their position in the export market.

Post Office Engineers' Salaries.—The *Daily Telegraph* reports that the Arbitration Court, which consisted of Mr. Harold Morris (president), Sir Felix Pole, and Mr. J. J. Mallon, have awarded the Post Office engineers new and improved scales of salary. The new basic salary, that is, salary exclusive of the cost of living bonus is to be:—Executive engineers, London, £450-20-550 a year (present scale, £430-20-510); executive engineers, provinces, £420 20 520 (present scale, £400-20-480); assistant engineers, London, £200 240 15 420 (present scale, £220-15-400); assistant engineers, provinces, £180-220 15 400 (present scale, £200-15-380). The lower minima awarded to assistant engineers relate to probationers. The salaries on the adjusted scale will be subject to the current cost of living bonus. The award becomes operative as from January 1st last.

Catalogues Wanted.—MESSRS. ABRAHAM BROS., of 7, Jinkee Road, Shanghai, wish to receive on behalf of the Van Chong Co., electrical engineers, trade catalogues with discounts, also particulars of new electrical accessories and novelties. The Van Chong Co. is Chinese, but the management is British.

New Electricity Company.—The Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Company was incorporated by the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Act, 1925, which received the Royal Assent on December 22nd, 1925. The Act empowers the company to supply electricity within the major portion of the counties of Cambridge and Huntingdon and the Isle of Ely, and in certain districts in the north-eastern portion of the county of Bedford. The provisions in the Bill in connection with the acquisition of land and the erection of a generating station were excluded owing to the Government proposals. Arrangements will therefore be made in the first place with the North Metropolitan Electric Power Supply Company for bulk supply. The directors and officials are as follow:—Directors—Sir James Devonshire (chairman), Viscount St. Davids, Mr. J. S. Austen, Mr. E. Garcke, and Sir Douglas Newton; chief engineer—Mr. J. M. Donaldson, M.I.E.E.; secretary and offices—Mr. Evelyn Boys, F.C.I.S., York Mansion, 94, Petty France, Westminster, S.W.1.

Unemployment.—The number of persons registered at the Employment Exchanges as wholly unemployed on February 15th was 1,139,300, representing a decrease of 25,657 on the week. The total was 100,496 less than that of February 16th, 1925.

Employment During January.—The February *Ministry of Labour Gazette* states that employment in the engineering industry remained bad on the whole during January; there was a slight decline in the electrical engineering section. The detailed statistics show that the total of unemployed in Great Britain and Northern Ireland in the electrical engineering industry was 4,954 (as compared with 3,917 a month earlier), an increase of 1.4 per cent. of the total number employed in the industry (76,720 in July, 1925). The percentage of unemployed in the electrical wiring and contracting industry is given as 9.5 (total insured, July, 1925, 12,660), which is an increase of 2.7 per cent. in the month. There was also an increase in unemployment in the electrical cable and wire and electric lamp manufacturing industries, this amounting to 1.9 per cent., making the proportion of unemployed 7.5 per cent. in a total (as at July, 1925) of 81,350.

Electricity in "Weir" Houses.—The Electrical Trades Union has written to Glasgow Corporation making representations against the employment of unskilled labour on the electrical work in steel houses, and asking the Corporation to refuse to supply electricity to any of the "Weir" housing schemes in the city. Bailie Higgins, who is secretary of the Clyde District Committee of the Union, states that no electricians are employed by Messrs. Weir. Electrical work is being done by girls, he alleges, and the sections are being wired in the factory by a method which is not in accordance with the I.E.E. rules, and which he considers is not safe for dwelling-houses. The Union expects to obtain the assistance of the Electrical Contractors' Association.

D

Social Events.—A social evening was held by the Siemens and English Electric Lamp Co., Ltd., on February 19th. The first part of the evening's entertainment consisted of a concert, one item of which was a play in three acts, written by two members of the staff. The cast was entirely composed of members of the staff. Another item was a humorous topical interlude by four outside representatives. The concert was followed by refreshments and a dance, in which approximately 100 people participated.

The first of what it is hoped will be a series of annual dances was held by the staff of the London Electric Wire Co. and Smiths, Ltd., at the Bridge House Hotel, London Bridge, on February 9th. The majority of the company came from the London offices and the Leyton factory, although there were representatives from the Manchester and Liverpool works. Some of the directors attended, and the affair was a thorough success.

Trade Announcements.—Messrs. Pritchett & Gold and E.P.S. Co., Ltd., announce that Messrs. Simpson, Baker and Co. are not now acting on their behalf in the counties of Gloucester, Wilts, Devon, Cornwall, Somerset, and Dorset. The territory, with the exception of Dorset, will be covered by their own representative, Mr. A. G. Foxlee. Dorset will be covered by the company's agents for the Eastern and South-Eastern areas—Messrs. Wood & Ball.

Messrs. Wm. Sanders & Co., of Falcon Electrical Works, Wednesbury, wish to absolutely repudiate rumours that they have disposed of their business. The business is the sole property of Mr. William Preston.

Mr. G. Gordon, late engineer to Messrs. Brown, Stewart, Ltd., has opened premises at 114, Alexandra Parade, Glasgow, as an electrical and mechanical repair shop and contractor. He asks for manufacturers' lists, &c.

The sale of "Redmanol" moulding compound in the English and Continental markets carried on by Mr. A. W. Bishop, Victoria Station House, S.W.1, has been taken over by a newly-formed company—Redmanol, Ltd. The company's specialities are coloured compounds, cements, resins, laminated insulation, compound for silent gears, &c.

Messrs. Ferguson Superheaters, Ltd., 3-4, Clements Inn, London, W.C.2, have been appointed sole selling agents in the London district by Quantameters, Ltd., for its remote tank level and flow indicator, &c.

The Surrey Engineering Co., Ltd., has removed from Surrey Street to 66-67, Shoe Lane, Fleet Street, London, E.C.

Mr. F. Knott (Maxted & Knott, Ltd.) is retiring from active practice after 34 years in the company, and Mr. E. G. Walker, of Westminster, has joined the firm. Messrs. Maxted and Scott, Ltd., will continue their present temporary head offices at Dunstable and their registered offices at 23, Queen Anne's Gate, Westminster, pending the securing of permanent headquarters, and will add to their special branches of engineering structural work, power plant, &c.

Messrs. Ross & Co. (Electric), Ltd., opened new premises at 41 & 43, Robertson Street, Glasgow, C.2, on March 1st.

Mr. H. M. Campbell, A.M.I.E.E., has secured premises at 10, Church Street North, Colchester, where he will open offices and showrooms for electrical products, on the 24th inst.

Messrs. Yates & Lomas, Ltd., electrical engineers, have this week opened new premises at 18 and 20, Chester Square, Ashton-under-Lyne.

Messrs. Alexander Brown & Co. have removed to 113, West Regent Street, Glasgow, C.2.

Mr. E. T. Turner, electrical engineer, of Epsom, has removed to larger premises at 77a, High Street.

Messrs. Edwardes Bros., of Blackfriars Road, London, will be glad if any reader will promptly 'phone to them at "Hop 2115" if anyone claiming to be a representative of the firm asks for advance payments for orders given or received on their behalf.

Holland House Electrical Co., Ltd., has opened an electric fittings, heating and cooking apparatus showroom at 247a, St. Vincent Street, Glasgow.

Mr. H. E. Massingham, electrical and mechanical engineer, 109, Edith Road, West Kensington, London, W.14 (telephone: Western 3129), has taken over the agency for London and district of Vesta, Ltd., Copenhagen, manufacturers of high-grade electrical cooking and heating apparatus.

Catalogues and Lists.—Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—Two well-illustrated and priced catalogues:—Section B, covering electrical accessories and materials; and Section L, dealing with "Cosmos" electric kitchen equipment of all kinds, domestic and commercial.

Tok Switches, Ltd., Granville House, Arundel Street, W.C.2.—A calendar-blotter advertising the company's products.

Mr. A. Hinderlich, 1, Lechmere Road, N.W.2.—A post-card advertising quartz crystals for radio work. Priced.

Mr. L. J. Wolf, 116, Putney Bridge Road, S.W.15.—An illustrated pamphlet dealing with "Hazemeyer" star-delta starters. Priced.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—Publications No. 379c, 413a, and 442, dealing, respectively, with "Sterling" square-law condensers, "Nong-Pong" valve holders, and headphones.

The Ray Manufacturing Co., of 350, Fishponds, Bristol, have sent us one of their "Andy" vest-pocket fuse-wire wallets, of which they recently made a large number for a well-known electrical manufacturing company.

Messrs. Belbin & Bowden, Ltd., 3, Finsbury Square, E.C.2.—A folder, containing prices of "Bow Bells" electric lamps.

Messrs. Ferranti, Ltd., Hollinwood, Lancashire.—Pamphlet Te 151, illustrating and describing "Ferranti" immersed transformers.

Messrs. E. Brook, Ltd., Empress Works, Huddersfield.—A folder, giving prices of the company's single-phase high torque motors up to 11 b.h.p.

Messrs. J. Hopkinson & Co., Ltd., Britannia Works, Huddersfield.—A card, illustrating the "Metacentre" reducing valve, and the company's works.

British Insulated Cables, Ltd., Prescot, Lancashire.—Pamphlet P.197, dealing with braided aerial cables and wire, and Pamphlet P.198, a list of the company's manufactures and branch offices.

Switchgear & Cowans, Ltd., Elsinore Road, Old Trafford, Manchester.—Descriptive Section No. 10, illustrating and giving full details of totally-enclosed, ironclad, interlocked, air-break switch- and fuse-gear.

Superlamp, Ltd., 92-94, Paul Street, Great Eastern Street, E.C.2.—February net trade price list of radio components and accessories.

The Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.—Catalogue W, containing details and prices of "Exide" radio batteries. The publication contains notes on the care of accumulators, valves, &c.

Bankruptcy Proceedings.—W. C. Rhodes (L. J. Palmer & Co.), electrical engineer and contractor, 141, Newspaper House, Corporation Street, Birmingham.—Last day for proofs for dividend, March 13th. Trustee, Mr. C. Hoult, Official Receiver, 191, Corporation Street, Birmingham.

W. R. Squire, electrical engineer, 11, Steward Street, Spring Hill, Birmingham.—Last day for proofs for dividend, March 15th. Trustee, Mr. C. Hoult, Official Receiver, Corporation Street, Birmingham.

A. E. Burrow and A. G. L. Prahm (World's Fair Supplies), makers of electrical and mechanical games, Bushy Lodge, Totterdown, Bristol.—Receiving order made February 22nd, on debtors' own petition.

A. F. Kingdom, electrical and mechanical engineer, Tavistock Street, Devonport, Plymouth.—Receiving order made February 22nd, on creditor's petition.

J. E. Byrne, electrical contractor, 3, Wells Yard, Waterworks Street, Kingston-upon-Hull.—Trustee, Mr. J. E. Stickney, Official Receiver, 37, Scale Lane, Hull, released February 18th.

A. C. R. Birkett, electrical engineer, Radio House, 22 & 24, Wheeler Gate, Nottingham.—Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham, released February 22nd.

Company Liquidations.—Pressland Electric Supplies, Ltd., wholesale electrical and radio factors, Eden Street, Kingston-on-Thames.—Mr. William Bronson, I.A., of 1, Cricklade Avenue, Streatham Hill, London, S.W., the liquidator appointed in the voluntary liquidation of the company has issued a circular to the creditors in which he states that the company was incorporated on December 6th, 1922, with a nominal capital being 1,100 shares of £1 each. Mr. Pressland purchased 1,000 of the shares for cash and 98 for a consideration other than cash. Mr. Hamilton, the secretary of the company, holds the remaining two shares. The progress of the company was such that it very quickly outgrew its capital, and it became vitally necessary to obtain further funds. A Mr. A. W. Matton was therefore approached, and was willing to advance certain sums from time to time, and he eventually became a debenture holder for £6,000. There was a sister company, namely, the Woodhall Wireless Manufacturing Co., Ltd., which, in fact, was the manufacturing part of the business. In the early stages of its manufacture the Pressland Company made advances to the Woodhall Co., and for these advances obtained a debenture for £2,000. Later, Mr. Matton did not consider he was sufficiently secured for the moneys which he had advanced, and for the guarantee which he had given the bank, so eventually this debenture was endorsed over to Mr. Matton. In addition to the cash advanced by Mr. Matton, and covered by his debentures, he advanced further sums of £1,000 and £200, so he is therefore an unsecured creditor for £1,200. At December 31st last the interest then due on the debentures had not been paid, and consequently a receiver was appointed on January 15th. There was some dispute with regard to the appointment of the receiver, and thereupon the receiver made application to the Court, and was appointed as an officer of the Court on January 29th. The validity of the debentures had been established. The business was a good one, and if its capital had been sufficient for its needs the present position would not have arisen. At present the receiver is still carrying on the business. The following are creditors:—

	£		£
Albion Manufacturing Co. ...	136	General Radio Co.	
Brandes, Ltd.	114	Hunt, A. H., & Co., Ltd. ...	
Burndept, Ltd.	324	Igranic Electric Co., Ltd. ...	
British Thomson-Houston Co., Ltd.	205	Knapp, Drewett & Sons, Ltd. ...

Graham, A.	100	Stevens, A. J., & Co.	
General Electric Co., Ltd. ...	153	Siemens Bros. & Co., Ltd. ...	
		Vandervell, C. A., Ltd.	

Radio Works, Ltd., 5, Dyers Buildings, Holborn.—A meeting of creditors was held on February 25th, at the offices of Messrs. R. L. Taylor & Co., I.A., South Place, E.C., when the chair was taken by Mr. R. L. Taylor, who had been appointed to act as the liquidator in the voluntary liquidation of

company. A statement of affairs was submitted which disclosed liabilities of £3,173, and net assets of £318, leaving a deficiency of £2,855. The deficiency as regards contributories was £2,955. The company was formed in October, 1923, with a share capital of £100. Mr. Taylor stated that the company had never been conducted at a profit, and the accounts for the year ended December 31st, 1924, showed a loss of £697. For the period to the date of liquidation there had been a further loss of £1,292. The turnover for the former period was £4,951, and for the latter £1,528. No resolution was passed; therefore the voluntary liquidation of the company will be continued with Mr. Taylor as liquidator.

Erith Electrical Co., Ltd., High Street, Erith.—A meeting of creditors was held on March 1st, at the Institute of Chartered Accountants. The chair was occupied by Mr. H. C. Merrett, who had been appointed to act as liquidator. The statement of affairs presented showed liabilities of £1,718, and net assets of £701, leaving a deficiency of £1,017 so far as the creditors were concerned. The issued capital of the company was £576, and as regarded the shareholders there was a deficiency of £1,593. Mr. Merrett reported that the company was registered on April 25th, 1924, with an authorised capital of £2,000. A sum of £400 was borrowed on the security of a debenture. The accounts for the period to March 31st, 1925, disclosed a trading loss of £585. On January 7th last the debenture holder appointed a receiver, who continued to carry on the business for a month. Following the appointment of the receiver several of the larger creditors approached the directors and pointed out that it would be necessary for the company to go into liquidation. He was nominated by the principal creditors, and the shareholders appointed him as liquidator. There was a petition on the file for the compulsory liquidation of the company; it had been adjourned for a month. A resolution was passed confirming the voluntary liquidation of the company with Mr. Merrett as liquidator, with an advisory committee consisting the representatives of the Siemens and English Electric Co., Siemens Bros. & Co., Ltd., and the Metropolitan-Vickers Electrical Co., Ltd. The following are creditors:—

	£		£
Callender's Cable & Construction Co., Ltd.	51	Metropolitan - Vickers Electrical Co., Ltd.	114
Cable Accessories Co., Ltd. ...	43	Rashleigh Phipps & Co.	23
De Maid, Ltd.	28	Siemens & English Electric Co., Ltd.	523
Falk, Stadelmann & Co., Ltd. ...	42	Siemens Bros. & Co., Ltd. ...	115
Electrical Supplies Co.	54	Young & Wildsmith	30
Foster Engineering Co.	48	London Electric Stores	42
General Electric Co., Ltd. ...	111		

Victoria Electrical (Manchester), Ltd., Oakfield Road, Altrincham.—A meeting of creditors was held recently, at Altrincham, when Mr. R. N. Brookes, C.A., Manchester, submitted a statement of affairs which showed total unsecured liabilities of £6,836. The net assets were only £802, which was insufficient to discharge the sum due to the bank, which held debentures for £2,464. There were, therefore, no assets available to meet the claims of the trade and the other creditors. The liquidator reported that following his appointment he closed down the business, as he was of opinion that it would be useless to carry it on. The creditors decided to confirm the appointment of Mr. Brookes as the liquidator of the company.

Brolt, Ltd.—Winding up voluntarily. Liquidator, Mr. A. V. Jerome, 15, Newhall Street, Birmingham.

Anode Wireless & Scientific Instruments, Ltd.—Trustee, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C., released February 18th.

B.M.A.S., Ltd.—A petition for the winding up of this company has been presented to the Chancery of the County Palatine of Lancaster, Manchester District, by the Chloride Electrical Storage Co., Ltd., of Clifton Junction, near Manchester, creditors, and will be heard at St. George's Hall, Liverpool, on March 8th.

Bishops Castle Electric Light & Power Co., Ltd.—First meetings of creditors and contributories, March 15th, at 2, Offa Street, Hereford.

Park Royal Engineering Works, Ltd.—Liquidator, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C., released February 23rd.

Dissolutions of Partnership.—Williams Lighting Co., dealers in gas and electric light fittings and accessories and wireless apparatus, 338, Mare Street, Hackney, 2, High Street, Tooting, and 212, High Street, Stoke Newington.—Messrs. P. & W. Lubelsky and N. Ruda have dissolved partnership. Debts will be attended to by Mr. W. Lubelsky and Mr. N. Ruda.

La Rose & Co., wireless and photographic accessories, 9, Stroud Green Road, Finsbury Park, N.—Messrs. L. & B. Phillips and I. Rose have dissolved partnership. Mr. L. Phillips will attend to debts.

For Sale.—Mr. H. J. Shaw will sell by auction on March 17th, at 550-556, Oxford Street, W., about 5,000 accumulators and batteries, h.p. cable, hand lamps, headphones, &c.; and on March 18th, at 13, High Holborn, W.C., a stock of wireless and electrical goods. Hull Corporation Electricity Department invites offers for about 10,800 yd. of scrap cable. (See our advertisement pages to-day.)

Another E.L.M.A. Design Course.—We have received the programme of the eighth illumination design course organised for contractors and others by the Electric Lamp Manufacturers' Association, which is to be held at the Lighting Service Bureau, Savoy Street, W.C.2, from March 23rd to 26th. This synopsis shows that a liberal lighting education is to be imparted in the few days of the course, both scientific and practical aspects of illumination receiving their share of consideration. The programme includes a visit to the Ideal Home Exhibition on March 25th, and concludes with an informal dinner to the "students."

Palestine Contract.—According to the *Daily Mail*, Sir John Jackson, Ltd., the London firm of civil engineering contractors, have recently acquired a part of the concession for water and electricity supply in Jerusalem held by M. Mavromatis, a Greek subject, whose claim against the British Government was upheld by the Permanent Court of International Justice in March, 1925. Mr. Percy Westacott, the managing director of the company, is at present in Palestine.

New French Company.—La Société Dauphinoise d'Accumulateurs is the name of a new company which has lately been formed at Grenoble (5, Rue Ampère) with a capital of 900,000 fr., to manufacture accumulators.

Book Notices.—"Behind the Counter: A Practical Guide for Shop Assistants." By W. H. Beable, F.S.M.A. P. 102. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. Price 3s. 6d. net.—Although this little book does not touch on electrical salesmanship, it may be read with advantage by electrical retail sellers, showroom and demonstration room assistants. Useful food for thought is contained in the recommendation of sympathetic treatment for the customer.

"Science Abstracts" (A & B). Vol. XXIX, Part 2, February 25th, 1926. London: E. & F. N. Spon, Ltd. Price 3s. each.

"The *Journal* of the South African Institution of Engineers." Vol. XXIV, No. 7, February, 1926. Price 2s.

Lighting and Power Notes.

Australia.—Sugarloaf Rubicon Scheme.—The Victorian Electricity Commission recently completed the first portion of the Sugarloaf Rubicon Scheme, when the first two cables of the Sugarloaf dam span were carried across a deep gully and creek and strained into position. In the Sugarloaf Rubicon hydro-electric scheme it was necessary to carry the main transmission line, which will eventually carry electricity at a pressure of 66,000 V from Sugarloaf Hill to the foothills on the other side of the weir. The shortest distance possible between the supports on either side was found to be 4,726 ft. and the work was successfully completed.—*Reuter's Trade Service* (Melbourne).

Belgian Congo.—Hydro-Electric Development.—M. van Deuren, Professor at the Belgian Ecole Militaire, has placed before the Union Coloniale a scheme which he has prepared for rendering the lower course of the Congo navigable between Matadi and Kinshasa and at the same time utilising the water power for the generation of electrical energy. The scheme includes the construction of seven dams.

Bexhill.—New Mains.—The Electricity Committee is to provide additional feeder and distribution mains at a cost of £6,500.

Brighton.—Electricity Supply.—The borough electrical engineer recently submitted a report to the Electricity Committee in which he stated that readings taken on the 230-V network during the past Christmas peak loads showed that 11 feeders out of 15 were overloaded and he recommended that some of the existing feeders should be extended and additional feeders laid in various parts of the town. The Town Council is to apply for sanction to a loan of £8,840 for extensions, the work to be carried out during the coming spring and summer.

Burnley.—Price Reductions.—The Corporation Electricity Committee has reduced the charges for lighting from 5d. to 4½d. per kWh. Power charges varying between 2½d. and 1½d. per kWh are to be reduced to 2d. and 1d. respectively. These reductions apply to the borough only.

Bury.—Loan Sanctioned.—The Town Council has received sanction to a loan of £14,291 for the provision of water-cooling towers at the electricity works.

Canada. — Hydro-Electric Development. — Rural hydro-electric development for the past fiscal year has cost the Provincial Government, under its guarantee of 50 per cent. payment of primary and secondary costs of transmission, approximately $335,000, which represents the most active twelve months in the history of rural power extension. Last year's programme of rural construction represents also between 400 and 500 additional miles of service.

A further step in the scheme for the development of between 50,000 and 60,000 h.p. upon the Riviere des Prairies, is marked by the presentation of a Bill in the Quebec Legislature on behalf of the Montreal Island Power Company. The project involves the expenditure of several million dollars. The construction of the dam and power house will probably take

two years. The Island Power Company proposes to dam the "Black River" at a point below Sault aux Recollet and to construct barriers which will form an artificial lake about three miles long

Quebec.—The Toronto correspondent of *The Times* reports that Mr. Taschereau, Premier of Quebec, has introduced a Bill in the Legislature to prohibit the export of hydro-electric power produced in the Province. All future contracts must contain a prohibitive clause, and a like clause must be written into existing contracts and retained in case of the renewal of such contracts. Power developed in Quebec can be exported to other Canadian provinces only on a definite understanding that such power shall not be re-exported to the United States.

Cheadle and Gatley.—Loan.—The Urban District Council has applied for sanction to a loan of £7,576 for carrying out an electricity scheme in the Gatley area.

Cheltenham.—Electricity Supply.—At a recent meeting of the Electricity Committee a letter was read from the Electricity Commissioners stating that in the light of the new Government proposals it was undesirable that any definite decision should be taken at present in regard to the proposed erection of a power station jointly with the Gloucester Corporation, and suggesting that the correct course would be for the two Corporations to inter-connect and to negotiate a short-term bulk supply contract with the West Gloucestershire Power Co. in order to provide for the requirements during the next three or four years.

Electricity Charges.—The Electricity Committee has adopted the following revised charges for electricity:—Lighting: For the first 125 hours' use per quarter of the maximum demand, 6½d. per kWh, and for all additional energy 2½d. per kWh; flat rate, ordinary consumers (other than special supplies), 5½d. per kWh, and large consumers, 4½d. per kWh. Churches, 4½d. per kWh. Kinemas, combined rate of 3d. per kWh. Power (other than special contracts), 1½d. per kWh.

Clayton (Yorks.).—Electricity Supply.—The Urban District Council, on February 24th, decided to apply for an Order constituting the Council as the distributing authority for electricity in the district. The decision is the outcome of the long-standing *impasse* due to rival claims to supply Clayton by the Bradford Corporation and the Electrical Distribution of Yorkshire, Ltd. The Council has opened negotiations with the Yorkshire Electric Power Co., with a view to obtaining terms for a supply in bulk. The Company is laying mains to the Clayton boundary, but the boundary is a considerable distance from the main consuming area.

Continental.—Rumania.—At a recent meeting of the Superior Power Council at the Ministry of Industry and Commerce, the Mayor of Bucarest was authorised to install in the municipal electricity works a 10,000-kW turbo-alternator.

The Mining Industry Company in the Banat has received a concession to erect a 30,000-kW power station at Boccha-Montana. This plant will use exclusively the coal of inferior quality found in the region.—*Reuter's Trade Service* (Bucarest).

France.—The Paris Municipal Council has decided to increase the price of electricity by 15 per cent.

Work is about to be commenced on the laying of an underground electric cable between Lille, Armentieres and Hazebrouck, with eventual extensions to Dunkirk, Calais, and Boulogne. The first section, that between Lille and Armentieres, is expected to be completed this year. The cable will replace an existing overhead cable.

A new hydro-electric station known as the Bonne Inferieure has recently been completed by the Société des Forces Motrices Bonne et Drac. The plant, which is being worked by the Société Hydro-Electrique de Fare et Morge, comprises three 3,500-h.p. generating sets. The output will be utilised in the Mure-Gap districts of the Department of Isere.

Portugal.—The Executive Committee of the Municipal Chamber of Lisbon will shortly discuss the conditions of the competition to be opened for the supply of electricity to the city. The committee has already received from a group of British bankers a request for a copy of the conditions.—*Reuter's Trade Service* (Lisbon).

Upper Silesia.—A *Reuter* message from Berlin states that it is reported from Breslau that an Anglo-American group of financiers is at present negotiating at Warsaw for the acquisition of the Chorzow electricity works. It is intended to enlarge the works so as to supply Polish Upper Silesia, the Dombrova coal district and Cracow industrial undertakings with electricity.

Switzerland.—Work will commence shortly on a new hydro-electric power plant on the Rhine, at Schwörstadt (Canton of Aargau), which is to cost £2,400,000, and is expected to yield 550 million kWh Two other plants will be erected subsequently on the Rhine, at Dogern and Reckingen.

Coventry.—Loan.—The Electricity Committee has recommended to the Town Council that application be made for sanction to a loan of £4,087 for electricity purposes.

Dover.—Loan.—The Electricity Committee is applying for sanction to a loan of £3,500 for electricity services.

East Hagbourne.—Electricity Supply.—The local Council has decided to withdraw its application to the Wallingford Rural District Council for a supply of electricity, and to make direct application for the necessary powers to carry out its own lighting scheme.

Godalming. — Price Reduction. — The Urban Electric Supply Co., Ltd., has reduced the charge for electricity for lighting from 1s. to 10d. per kWh, subject to a minimum charge of 12s. 6d. for the winter quarters, and 8s. 4d. for the summer quarters.

Guildford.—Loans Sanctioned.—The Electricity Committee has received sanction to a loan of £10,000 for mains and meters.

Helsby.—Proposed New Power Station.—The Mersey Power Co., Ltd., is seeking consent from the Cheshire County Council to a scheme for the erection of a power station at Helsby.

Irish Free State.—Leixlip (Co. Kildare).—A memorial petitioning the Dublin United Tramways Co. to extend the tramway service and electricity supply to Leixlip has been approved by the Kildare County Council.

Shannon Scheme.—The power station at Ardnacrusha which has been constructed as a temporary means of supplying electricity for work on the Shannon scheme, is now completed, and was put into operation recently.

Lancaster.—Electricity Supply.—A second h.p. main is to be laid between Ridge Lane sub-station and Morecambe boundary at an estimated cost of £5,000.

Leicester.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer: Mr. T. R. Smith) for the year ended December 31st last, record a total revenue of £294,292, as compared with £300,723 in the preceding year. Working expenses amounted to £158,592, as against £139,696, leaving a gross profit of £135,700 (£161,027). After deducting capital charges, and special expenditure charges to revenue of £14,079, there was a net profit of £544. The reduction in the charges for electricity made in 1924 operated during the full year of 1925, resulting in an approximate decrease in revenue of £51,000. The total capital expenditure during the year was £164,151, and the balance in reserve now stands at £113,293. The sales of electrical energy increased by 5.5 per cent., as compared with the previous year, and the average price per kWh obtained showed a decline of .142d.

Liverpool.—Rate Relief Contributions.—The Corporation Tramways and Electricity Committee has decided to transfer £115,000 from the profits towards the relief of the rates—£50,000 from the tramways and £65,000 from the Electricity Department.

Breakdown Inquiry.—A special sub-committee of the City Council, which has been inquiring into the recent breakdown in electricity supply, has submitted a report, which states that the breakdown on January 28th was due to an accident. After the fullest tests a new motor-generator was switched into operation when some inherent defect developed that had not shown up under the tests that had been applied both by the makers and the staff under all usual conditions. The short circuit wrecked the motor and wrenched off a copper lead some 50 yards away, which was connected to the bus-bars. The finding of the Committee was as follows:—"We wish to place on record that the city electrical engineer and his staff retain our complete confidence."

Mansfield. — Investigation Committee Appointed. — The Town Council has appointed a committee to make a full investigation of the affairs of the electricity undertaking.

Morecambe.—New Feeder Cable.—The Electricity Committee has decided to purchase a second e.h.p. feeder at a cost of £11,600.

Electricity Charges.—The borough electrical engineer has been instructed to prepare alternative schemes for a new scale of charges to become operative from April 1st next based on the principle of a fixed charge, plus a "unit" charge for energy consumed.

New Sub-Station.—The Committee is to obtain a site at White Lund for the erection of a sub-station.

Northern Ireland.—Lurgan (Armagh).—At a recent meeting of the Urban District Council, the report from the consulting electrical engineer was submitted for consideration. This report contained the engineer's new estimate for completion of the electricity scheme in the town. The new estimate amounted to £13,830, and the amount already expended amounted to £4,875. It was decided to apply for sanction to a loan of £20,000 to complete the scheme.

Belfast.—The *Irish Electrician* states that it is understood that the chief engineer, Mr. Johnston Wright, has under consideration the matter of replacing the two 600-kW generators at present in the harbour station by two 1,500-kW generators. There are at present two 1,500-kW sets installed in this station. It is reported that the 1,000-kW turbo-alternator at present installed in the York Street works of the Flax Spinning Company will be shortly replaced by a set of 2,500 kW capacity.

Poulton.—Electricity Supply.—The Urban District Council has asked Blackpool Corporation to proceed with a separate Order for the supplying of electricity to Poulton.

Plymouth.—Price Reductions.—The Electricity Committee has recommended a reduction in the charges for lighting from 4½d. to 4d. per kWh, and a proportionate reduction in the charges for other purposes.

Loans Sanctioned.—The Committee has received sanction to the borrowing of £25,000 for general distributing mains and £6,000 for services in the Lipson Vale and Laira district. Cable extensions have also been approved, at a total estimated cost of £2,821.

Plympton.—TRANSFER OF UNDERTAKING.—Under an Order granted by the Electricity Commissioners, the Plympton Rural District Council is authorised to acquire, as from April 1st, the electricity undertaking at Plympton of Messrs. Hurrell and Heath at an agreed price of £7,000, and to supply electricity obtained in bulk from the Plymouth Corporation throughout its area. Until such time as it is possible to lay a h.p. cable from the Plymouth Corporation's works, the Council will continue to utilise Messrs. Hurrell & Heath's generating plant at Plympton. Work is proceeding for the extension of the supply to the parishes of Compton Gifford and Plymstock.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Keighley Corporation, for the extension of its area of electricity supply so as to include the urban district of Silsden and certain parishes in the rural district of Skipton; the County of London Electric Supply Co., Ltd., and the North Metropolitan Electric Power Supply Co., for the reciprocal supply of electricity in bulk.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Gwynedd Trust, Ltd., to supply in the borough of Pwllheli and the rural district of Lleyn, and the Barry Urban District Council to supply in its area.

Vale of Clwyd.—INQUIRY.—According to the *Manchester Guardian*, the Ministry of Transport has appointed Mr. O. A. Sherrard to hold an inquiry at the offices of the Ministry in London on March 5th with reference to the Denbigh and St. Asaph Electricity Special Order and the objections to its confirmation made by the Rhyl Council. The Order proposes to confer upon the Electricity Distribution of North Wales and District, Ltd., powers of supply in the Vale of Clwyd, including an area in the vicinity of Rhyl in which the Rhyl Council has applied to be the recognised distributor.

West Indies.—GRENADA.—Subject to the approval of the Imperial Colony Crown Agents, the Government will shortly enter into a contract for the erection of a hydro-electric plant at Grand Etang in the interior of the island for lighting St. George's.—*Reuter's Trade Service* (St. George's).

Willesden.—LOANS SANCTIONED.—The Electricity Committee has obtained sanction to loans of £8,000 for the extension of the sub-station at Acton Lane, and to £1,580 for a sub-station at Oxgate Lane.

Tramway and Railway Notes.

Colne.—MOTOR OMNIBUSES.—At a meeting of the Town Council, on February 25th, the Town Clerk read a letter from the Ministry of Transport relating to an objection signed by residents in the Laneshawbridge district regarding the proposed abandonment of the light railway. It was decided to forward to the Ministry the observations of the Tramways Committee which had passed a resolution that a service of motor omnibuses should be substituted for the present tramcar service on the reconstruction of the roadway.

Hull.—TRAMWAY IMPROVEMENTS.—The Corporation Tramways Committee has given instructions for the completion of the section of tramway connecting Spring Bank West with Cottingham Road. The cars will run along the Chanterlands Avenue extension. The chairman states that the Beverley Road service has been improved by the addition of two cars. A scheme for relieving congestion in King Edward Street by altering the termini has been referred to the manager for report.

Leeds.—ELECTRICITY SUPPLY FOR TRAMWAY.—The Corporation Cleansing Committee is considering a scheme for the generation of electricity for the tramway by the utilisation of refuse, by means of a new destructor plant at Kidacre Street, expected to be completed in the coming summer, at a cost of £23,000.

London.—LOTS ROAD STATION EXTENSIONS.—The operation of the extension from Charing Cross to Kennington will make further demands on the Lots Road power station and in consequence of this and other transport facilities to be provided in the future the generating plant is being augmented accordingly. The power station at present contains seven turbo-alternators of 6,000-kW each and three of 15,000-kW each. A fourth 15,000-kW machine is under construction, and when this is complete the generating capacity of the power station will be 102,000 kW. The present maximum load on the station is about 70,000 kW, and it is estimated that in five years' time the total demand will be about 100,000 kW. To provide for this additional load further turbo-alternators, which will have a capacity of 15,000 kW, will be installed in place of the existing 6,000-kW machines, and further 50,000-lb. boilers will be substituted for the existing 16,000-lb boilers.

Rawtenstall.—INQUIRY.—Speaking at a Ministry of Transport inquiry at Rawtenstall, on February 24th, regarding the refusal of the Corporation to license a private firm's motor 'buses, Mr. C. L. E. Stewart, tramway manager, said there was a prospect of a loss on the tramway system at the end of the year. On the 'buses there was a profit of 3.595d. per mile, the receipts averaging 16.330d. per 'bus mile. The net surplus last year was £2,396. He estimated the loss of revenue to the Corporation in the event of the Ribble Motor Services being allowed to run a duplicate service, would be £3,000. Last year as a result of the operation of the Ribble Services, there had been a loss of £400 on the Waterfoot section of the tramways. Mr. Wrottesley, K.C., said the Corporation was bound to see that its transport undertaking was not exposed to unnecessary loss. There was already the prospect of a deficit on the tramways and it was only because the 'buses were a success that there was any surplus on the Corporation transport undertakings. It could not continue to provide tramway facilities if competition was allowed.

Southern Railway Electrification.—In the course of his speech at the annual meeting of the Southern Railway Co., on February 25th, Brig.-General Everard Baring stated that with regard to electrification, in April last, electric working was introduced on the old Brighton section from Victoria to Coulsdon and Sutton *via* Croydon, and in July the services from Waterloo to Guildford and Dorking, and on the South Eastern section from Victoria and St. Paul's to Orpington and the Crystal Palace were opened. The results in all these cases have more than exceeded expectations, and the number of passengers carried in these newly-electrified areas shows an increase as compared with the corresponding period of 1924 of 3,200,000, or nearly 12 per cent. The heavy initial cost of introducing the electrical services, involving the training of large numbers of men in new methods, and the testing of the new equipment both on the trains and in the power stations, has been finished with to a large extent, and the extra revenue from electrification is now covering the extra cost of the improved services. Plans and estimates are being considered for the extension of the electrification to complete the whole of the suburban area, and it is expected to make a start with this during the current year. It involves the electrification of the services from London Bridge and Victoria to Sutton and Epsom, Epsom Downs and Purley, with possible extensions to Caterham and Tattenham Corner, and from Crystal Palace to Beckenham.

Electric train services were commenced on February 28th, between Charing Cross, Cannon Street, and London Bridge, and (1) Orpington, *via* Chislehurst, (2) Bromley North, *via* Hither Green, (3) Beckenham Junction, Hayes, and Addiscombe, *via* Lewisham and Ladywell. These routes, totalling eighty-eight track miles, have been electrified at a cost of £1,300,000, and twenty eight-coach trains have been built for the services, comprising 160 vehicles, apart from spare trains. The new services, giving 50 to 100 per cent., improved schedules on Sundays, mid-day on weekdays, and in the evenings after the rush hours, will result in an increased train-mileage of 8,132 miles a week. It is anticipated that all three Dartford routes from Charing Cross and Cannon Street will be completed by June next.

South Shields.—INQUIRY.—An inquiry was conducted by Mr. Alan D. Erskine and Mr. Thomas L. Patterson, inspectors of the Ministry of Transport, on March 26th and 27th, into the application of the Kearney High Speed Tube Railway Co. for an Order to construct a tube under the Tyne between North and South Shields. Mr. Sidney Morse, in stating the case for the promoters, said the present proposal had been before North and South Shields since 1922, and was ultimately withdrawn by the promoters, who undertook to raise the capital, £300,000, in London. The proposed fare for the tube would be 2d. Passengers on the tube would receive a three-minutes' service each way as a maximum, as against twenty to twenty-five minutes now occupied from the centre of one town to the centre of the other, on a ferry journey. South Shields Town Council supported the general principles of the scheme, but Tynemouth Corporation and the River Tyne Commission opposed the application.

St. Helens.—DEVELOPMENTS.—The Corporation Tramways Committee proposes to introduce railless cars on various routes, and application has been made for a Provisional Order. The Committee also proposes to construct a single-line tramway track from Duke Street to Sefton Place.

Telegraph and Telephone Notes.

America.—TELEPHONE USERS.—The fact that the people of the United States were using 16,935,918 telephones at the start of 1926, an increase of 863,160 over a year ago, is shown by figures soon to be published by the American Telephone and Telegraph Co.; for every hundred of population there are 14.7 telephones. The European country in closest competition with the United States in telephone use is Sweden, with 418,318 at the start of 1925, or 6.9 per 100 of population; Switzerland follows with 189,429, or 4.8 per 100 persons; then Germany, with 2,385,177, or 3.9; Great Britain with 1,260,242, or 2.7 per 100; France with 694,937, or 1.7; and Italy with 173,927, or 0.4.—*Reuter* (New York).

Canada.—RADIO OPERATORS.—Canadian Marconi operators have notified the companies concerned that they desire to abrogate the existing contract, with a view to increased wages and improved conditions. The companies in their reply express a desire for a downward wage revision.—*Reuter* (Toronto).

China.—FOREIGN CABLE DUES.—A sidelight on the conditions in China is an intimation from all the foreign cable companies at Shanghai to the effect that, since they have for a long time not received from the Chinese administration any share of the moneys paid by the public to the administration

for the dispatch of telegrams to places abroad, the companies will no longer accept other than Government telegrams from the administrations in the Yangtse Valley provinces unless accompanied by cash.—*Financial News.*

Chile.—Telephone Development. — Having commenced operations 36 years ago, the Chili Telephone Co. may claim to be the pioneer of modern telephone development throughout the Republic. It installed in 1922 an automatic service at Valparaiso, and similar plant is now in course of manufacture at Messrs. Siemens Bros'. factory at Woolwich, London, and will be installed in Santiago. According to the *Chilean Review*, considerable reconstruction work has had to be carried out in the capital in connection with the installation of this up-to-date plant, embracing the laying down of cable ducts and street chambers to which overhead wires can be transferred. Modern switchboards and equipment involving similar reconstruction work are also being installed at Iquique, Antofagasta, and Concepcion, and in several towns of lesser importance underground installations to take the place of overhead wires are being actively proceeded with. The company has about 20,000 subscribers and operates some 14,000 miles of trunk lines throughout the Republic, which are connected to 260 exchanges. The company contemplates an extension of its service in the South of Chile to embrace the important port of Valdivia, and in the North the consolidation of telephone service in the nitrate area. Apart from a few technical officers the staff of the company, at present numbering about 900, is almost entirely Chilean, and the practice has been followed of bringing Chilean youths to England for training at the works of Messrs. Siemens Bros. and various technical schools. The plant and installations are valued at about £1,000,000.

India.—Radio-Telegraph Services.—The annual report on the post and telegraph services for the year 1924-25 shows, says *The Times*, that the number of radio telegrams exchanged with ships at sea by coast stations in India and Burma was nearly 20,000. A number of official telegrams was also exchanged with the British naval station at Matara, Ceylon. The service between Burma and the Malay Peninsula, *via* Rangoon and Penang, continued to work satisfactorily. Communication was also established between Rangoon and Sabang (Sumatra) for meteorological purposes. Wireless communication with Kabul, *via* Peshawar, was maintained, and traffic was passed whenever the condition of the land line necessitated it. The Marconi arc station erected for the Chinese Government at Kashgar continued in operation and exchanged official messages with India *via* Peshawar.

Facilities have been offered by coast stations whereby ships at sea equipped with direction-finding installations can obtain bearings on the coast stations as an aid to navigation. Bearings thus obtained on Diamond Island in unfavourable weather have been particularly valuable, and results elsewhere have been satisfactory. The report further states that the British official Press *communiqués* from the Oxford radio station were received at Jutogh and passed to Reuter's Agency for distribution to subscribing newspapers. As usual, this service was interrupted for some weeks during the hot weather owing to weak signals from Oxford and atmospheric interference.

Bharatpur State Telephones.—Bharatpur was the first Indian State to adopt the automatic telephone system. It is now nearly two years since the Maharajah started to consider the possibilities of providing an automatic service which would cater for the Palace telephones, the State offices, the general public of Bharatpur City, and also give trunk facilities to distant parts of Bharatpur State, and, *via* Agra, to the whole of Northern India. The scheme finally selected consists of a central Relay automatic exchange of the new "Britannic" class connected with the Palace by two miles of underground cable. The circuits are arranged so that an unauthorised person attempting to call up any of His Highness's telephones is at once connected to the inquiry clerk, who completes the call at his discretion. Should the caller not "get through" within twenty seconds of the time when he lifts his receiver, the automatic apparatus will dial the inquiry number itself. The same result will occur should the caller dial a wrong number, or an "out of order" number. Public call offices are to be provided at all the important police chowkies and all effective calls from these telephones will be automatically metered in the central exchange. All the apparatus for the installation has arrived in India and construction work will be commenced immediately under the supervision of one of the Relay Automatic Telephone Company's engineers stationed in India. It is expected that the system will be in working order by April.

International Telephony.—Special Committee.—A determined effort to obtain better international telephone service was initiated, says the *Financial Times*, at a meeting of the special committee appointed by the Brussels Congress of the International Chamber of Commerce. The International Telephone Committee held its first meeting under the chairmanship of Sir Martin Abrahamson, representing Denmark, and Mr. F. Gill, representing England, laid stress on the fact that, technically, there should be no difficulty whatever in any capital in Europe getting into communication with any other capital in from five to fifteen minutes, and for ships in any big port getting into touch with their home office in from 15 to 30 minutes.

Irish Free State.—Telephone Service.—According to an official of the General Post Office in Dublin, there are now up to 24,000 telephones in use in the Irish Free State.

The Telephone Service.—School Installations.—The Willesden Education Committee has recommended that the local elementary schools be equipped with telephones, and an application for a grant for the purpose has been made to the Board of Education. Telephones have been provided in several of the L.C.C. secondary schools, but so far no elementary school has been so favoured. The Willesden precedent, if the Board of Education agrees to the grant, will probably be followed elsewhere.

Monthly Increase.—Sir W. Mitchell-Thomson (Postmaster-General), in a written reply to a question in the House of Commons, states that telephones in this country are at present being installed at the rate of 19,000 a month.

Radio Notes.

Committee of Inquiry.—Result Forecast.—The Committee of Inquiry, presided over by Lord Crawford, that was appointed by the Government to consider the future of broadcasting has completed its report, which is a unanimous one. Contrary to many expectations, says the daily Press, it is gathered that the Committee recommends that a further licence should not be granted to the British Broadcasting Co. to continue in control after the expiry of its existing licence on December 31st next. It will almost certainly be found that the Committee has favoured the creation of a national board, representative of the wireless trade, the public, and the Government, to carry on the work now performed by the B.B.C. The new body would be answerable to Parliament through the Postmaster-General. The financial proposals are designed to prevent any larger sum being taken from the public than is actually required to maintain the organisation.

India.—Increase of Licences.—The annual report on Posts and Telegraphs of India for 1924-25 (Calcutta: Government Press, 4s. 3d.) gives some interesting details of what may be described as the beginning of broadcasting in that country. According to *The Times*, it states that experimental broadcasting by the radio clubs in Calcutta, Bombay, and Madras stimulated public interest and caused an increase in the number of licences for receiving stations. In the last seven months of the year over 1,000 licences were issued in a new form. They are obtainable from certain head post offices and cover the use of receiving sets in British India, except Baluchistan and the North-West Frontier Province. Licences for fixed stations continued to be issued for transmitting and experimental purposes; 81 were renewed, and 220 new licences were granted during the year. In future fixed station licences will not be necessary for receiving stations, owing to the introduction of broadcast receiver licences. The import of wireless apparatus is restricted to those who possess licences for the purpose. At the end of the year 90 such licences were held. There will be, no doubt, a very rapid increase in the number of licences now that broadcasting is to be conducted on a commercial basis by the company, which was recently granted an exclusive contract.

Radio Reception on Trains.—G.W.R. Experiments.—Following the successful experiment of installing wireless receiving apparatus in a moving train and picking up broadcast programmes during a journey from Bristol to Cardiff and back, the Great Western Railway announced that on March 2nd the Cornish Riviera express, which leaves Paddington at 10.30 a.m. for Plymouth, was equipped with a wireless installation similar to that used in the special train which carried out the Bristol-to-Cardiff experiment. Loud-speakers were set up in one of the dining cars, and the compartments of a first-class coach were fitted with headphones. The reception was successful, but was subject to interference from the lighting dynamos under the coaches.

South Africa.—Radio Legislation.—On March 1st the Union House of Assembly read for the first time a comprehensive Bill dealing with all phases of wireless. According to *The Times*, heavy penalties are provided for "piracy," and for illegal broadcasting, while the obstruction of communication, the dispatch of false telegrams, &c., are punishable by a fine of £50 and three months' imprisonment, with or without hard labour. The Bill authorises any competent postal official to enter any premises to inspect the wireless apparatus and makes provision for the zone system of graduating broadcasting fees.

Spain.—New Station.—The new Barcelona broadcasting station (EAJ1) on the top of Tibidabo (1,745 ft. high), the loftiest hill in the vicinity of the Catalonian capital, has just been completed. It will have a wave-length of 325 metres and the station will be the most powerful one in Spain and one of the most powerful in Europe, and its altitude will contribute in its due ratio to the power. The official inauguration took place on February 25th.—*Reuter* (Barcelona).

United States.—Proposed Regulations.—The White Bill for the regulation of broadcasting was approved on February 11th by the House Merchant Marine Committee. The measure grants the Secretary of Commerce authority to issue radio licences, but rejected applicants have the right of appeal to a Federal Radio Commission and to the courts. The Commission would consist of five members appointed by the President from regional zones.—*Reuter's Trade Service* (Washington).

Wave-lengths.—KESTON TESTS.—The B.B.Co.'s Keston (Hayes) receiving station has been again checking some of the European stations' wave-lengths. The Bureau International de Radiophonie at Geneva had previously arranged for certain Continental stations to work on revised wave-lengths, in order further to determine what recommendations should be submitted to the conference which is to take place on March 25th at the Palais des Nations, Geneva. The Continental stations co-operating were the German stations at Munich and Berlin (two), two Austrian stations (Radio-Wien and the new and important Rosenhugel), also Brno, Budapest, Helsingfors, Prague, Zurich, and Sundsvall (Norway). During the test many other stations were picked up, and in this country both Aberdeen and Swansea were detailed to co-operate on specified wave-lengths. To the exactitude preserved by the stations, which had all been allotted wave-lengths differing considerably from their normal, the exception was that of Zurich. Barcelona, working on increased power, jammed Nottingham, and many outside stations, supposed to be working on their normal wave-lengths, wandered sadly beyond their appointed limits; also Morse interference from ships' stations was a constant cause of trouble.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Argentina.—BUENOS AIRES.—April 12th. Public Works Department. Rock drilling installation, including steam shovel aerial transporters, 170-h.p. electric generating plant, &c.*

Australia.—MELBOURNE.—April 7th. Victorian Government Railways. One hydraulic plate-bending press.* April 21st. Eight electric overhead travelling cranes.*

BRISBANE.—August 27th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator and two water-tube boilers, with economisers, draught plant, &c. Specifications (£5 5s.) from the offices of the company, Boundary Street, Brisbane.

SYDNEY.—April 21st. New South Wales Government Railways. Four motor-generator sets. Four switch operating batteries.*

Birmingham. — March 6th. Tramways Committee. Traction motors, power wiring, &c., for 30 tramcars. Form of tender from Mr. A. Baker, general manager, Tramway Offices, Council House, Congreve Street.

Brazil.—RIO GRANDE DO SUL.—April 15th. Port and Bar Management. 10 electrically-operated portal cranes, capacity 2,500 kilos; 2 ditto, 5,000 kilos capacity; and 7 electric winches or capstans.*

Bridlington. — March 10th. Electricity Department. Stores for 12 months, including electrical sundries, lamps, cables, &c. (February 26th.)

Cambridge.—March 6th. Corporation. Twelve months' supply of electric lamps. Forms of tender from the Borough Engineer and surveyor.

Cardiff.—March 8th. Electricity Department. One 10,000-kW turbo-alternator and condensing plant. (February 5th.)

March 22nd. Grit-collecting plant, 100-kW, 400-V alternator, &c. (See this issue.)

Croydon.—March 17th. Board of Guardians. Six months' supply of electrical fittings and sundries. Forms of tender from the Union Offices, Mayday Road, Thornton Heath.

Dublin.—Commissioners of Dublin Union. Electrical fittings for six months. Mr. John P. Condon, clerk of Union, 1, James' Street, Dublin.

East Ham.—March 15th. Electric Lighting and Tramways Department. Cable, bifurcating boxes, and joint boxes. (February 26th.)

Eccles.—March 6th. Health Committee. Installation of electric lighting, including wiring and fittings, for houses being erected in Anson Street, Monton. Form of tender from Borough Electrical Engineer, Electricity Works, Cawdor Street.

Edinburgh.—March 8th. Electricity Supply Department. One 25,000-kW turbo-alternator with condensing plant, or alternatively, one 20,000-kW turbo-alternator with condensing plant. (February 5th.)

March 9th. Tramways Department. 1,200 tons of steel tramway rails. Specifications, &c., from Tramway Manager, 2, St. James' Square.

Six or 12 months' supply of cables, conduits, 604 frames and covers, house-service fuse boxes, electricity supply meters and meter boards. (See this issue.)

Grimsby.—March 29th. Electricity Department. One 2,000-kW converter, one 1,000-kW do., l.p. switchgear, cable work, &c. (See this issue.)

Hamilton.—County of Lanark District of the Middle Ward. Electric lighting installations in 50 houses near Airdrie and 32 houses near Wishaw. Particulars from Mr. P. C. Smith, Housing and Town Planning Department, District Offices, Hamilton.

Hull.—March 18th. Electrictiy Department. Static transformers and motor converters. (See this issue.)

India.—March 30th. India Store Department. Complete equipment for one rotary-converter sub-station, three separate rotary-converter sets and track sectioning switchgear for the G.I.P. Railway electrification. (February 26th.)

March 19th. Inert electric cells, "S" pattern. (See this issue.)

April 23rd. Electrical equipment for 15 motor coaches and 42 trailer coaches. (See this issue.)

April 13th. 23 electric passenger locomotives. (February 26th.)

Kettering.—March 9th. Electricity Department. E.h.p. and l.p. cables. (February 26th.)

March 23rd. Transformers, e.h.p. and l.p. switchgear, one 1,500-kW rotary-converter equipment, and one steam turbo-boiler feed pump. (February 26th.)

Letterkenny (County Donegal).—Committee of Management of the Tirconaill Mental Hospital. Oil engine, generator, switchboard extension, booster, motors, connections, &c. Dr. J. C. Martin, resident medical superintendent, Mental Hospital, Letterkenny.

London.—HOLBORN.—March 10th. Board of Guardians. Electrical fittings for six months. Forms of tender from Mr. C. J. Cross, Clerk to the Guardians, 53, Clerkenwell Road, E.C.1.

LONDON COUNTY COUNCIL.—March 23rd. Wiring and fittings for electric lighting at St. Paul's Road elementary school, Bow, E. (See this issue.)

SOUTHWARK.—March 11th. Board of Guardians. Six months' supply of electric lamps. Forms of tender from the offices of the Board, Ufford Street, Blackfriars, S.E.

BETHNAL GREEN.—March 16th. Board of Guardians. Installation of electric lighting in the office extension at Bishop's Road, N.E., and rewiring of the existing building. (See this issue.)

METROPOLITAN ASYLUMS BOARD.—March 24th. Installation of electric lighting at the Southern (Lower) Hospital, Dartford. (See this issue.)

ISLINGTON.—March 16th. St. Mary's Board of Guardians. Electrical supplies for six months. Forms of tender from Mr. A. King, Guardians' School, Hornsey Road, N.

Manchester.—March 22nd. Electricity Department. 3-phase, 420-V sub-station switchgear, 3-phase, 6,600-V and 11,000-V ditto, three 500-kVA static transformers, and one 7,500-kVA forced-air-cooled transformer. (February 19th.)

March 22nd. One 5-ton electric tipping wagon and one 10-ton electric tractor with trailer. (February 26th.)

Menston (Yorkshire).—The Committee of the Wharfedale Isolation Hospital has decided to invite separate tenders for installing electricity at the hospital—one for an electric lighting installation in the various parts of the Institution, and the other for electric power only in the boiler block.

Mountain Ash.—March 22nd. Electricity Department. Two 500-kVA transformers. (See this issue.)

Newark-upon-Trent.—March 16th. Electricity Department. Medium and l.p. switchgear and accessories. (February 26th.)

Newcastle-under-Lyme.—March 16th. Electricity Supply Department. 2,300 yd. single l.p. cable and 800 yd. single l.p. cable. (See this issue.)

New Zealand.—WELLINGTON.—April 23rd. Public Works Department. 11,000-V metering equipment and switchgear for the Arupuni electric power scheme.*

Oldham.—March 8th. Board of Guardians. Electric lamps and fittings. Form of tender from Mr. F. W. Fletcher, clerk to Board of Guardians, Union Offices.

Otley.—March 30th. Wharfedale Isolation Hospital Committee. Electrical installation at the Isolation Hospital, Menston. (See this issue.)

Portsmouth.—March 17th. Board of Guardians. Three months' supply of electrical stores and lamps. Forms of tender from the Guardians offices, St. Michael's Road, Portsmouth.

Electricity Supply Department. Erection of a steel-framed turbine house. (February 19th.)

Preston.—March 12th. Electricity Department. 4,200 yd. (approx.) e.h.p. cable and four sets of e.h.p., 3-phase transformers. (February 26th.)

Pentre, Rhondda.—March 27th. Rhondda U.D.C. Electricity Department. 12 months' supply of house-service a.c. ordinary and prepayment meters, cable, joint boxes, compound, cut-outs, &c. (See this issue.)

Rochdale.—March 16th. Gas and Electricity Committee. One 1,250-kW (or alternatively 1,500-kW) rotary-converter equipment, including transformer and switchgear. (February 26th.)

Roxburgh.—March 15th. Electrician's work required in extension of Grammar School. Schedules from Messrs. Reid and Forbes, architects, 7, Ainslie Place, Edinburgh.

South Africa.—JOHANNESBURG.—April 12th. S.A. Railways and Harbours. Electrification of Cape Town Suburban Railway. Supply and erection of the overhead equipment of the permanent way and overhead transmission and distribution lines. (February 12th.)

Sutton Coldfield.—March 24th. Electricity Department. E.h.p. underground mains, distributors, feeder, pillars and network fuse boxes. (See this issue.)

Tynemouth.—March 15th. Electricity Department. One 250-kVA transformer. (February 26th.)

Warrington.—March 15th. Electricity and Tramways Committee. Motors and transformers. (February 26th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—Melbourne.—According to the *Sydney Morning Herald*, the City Council Electricity Committee has reconsidered the recommendation to accept the tender of C. A. Parsons & Co., Ltd., for a turbo-generator, and has decided to call for fresh tenders. The original tenders were:—C. A. Parsons & Co., Ltd., £18,953, plus £10,145 duty for a 6,000-kW plant; the Australian firm of Thompson & Co., £24,054 for a 5,000-kW machine, plus £4,152 duty on parts which would have to be imported. The action of the committee in selecting the overseas tender caused several heated debates in the Council, and the notice of motion was referred back to the Committee.

In calling for fresh tenders, it is stated that the Committee, to make the conditions more definite, has decided to provide that the size of the plant be not less than 5,000-kW and not greater than 5,500 kW, with the usual overload.

Tenderers will also be invited to quote for as much of the plant as can be efficiently manufactured in Australia, and to set out particulars of the plant to be manufactured there and the value thereof.

Barking Town.—Housing Committee. Accepted:—
Wiring 59 houses on Eastbury estate (£408).—Jameson & Burrows.

Beckenham.—Electricity Committee. Recommended:—
Water-softening plant (£293).—Vennicott Water Softener Co.

Belgium.—Belgian, German, Austrian, Danish, French, and British (Callender's Cable & Construction Co., Ltd.) firms competed last week for a Belgian State Railway cable and wire contract. Altogether there were 22 lots, for 15 of which Belgian manufacturers submitted the lowest tenders, German concerns being successful as regarded the remaining seven.

Biggleswade.—Urban District Council.
Wiring 41 Townfield 1925 houses:—

Christy Bros.	£9 9 0	per house.
First Garden City, Ltd.	8 9 0	,,
F. Bott & Son	6 10 0	,,
H. Knight & Son. (Recommended.)	**6 9 0**	,,
N. R. Collings & Co.	5 19 0	,,

(Electricity supplied by First Garden City, Ltd.)

Birkenhead.—Electricity Committee. Accepted:—
400-kVA transformer (£363).—English Electric Co., Ltd.
Three miles service cable (£881).—Liverpool Electric Cable Co., Ltd.

Bispham.—
Electrical work at the Lancashire and Cheshire Miners' Home, Bispnam, near Blackpool.—G. Morrison.

Calne.—Board of Guardians. Accepted:—
Installing electric lighting at the Institution.—H. E. Gunning & Sons.

Carnarvon.—Electricity Committee. Accepted:—
Linking-up main (£122).—National Electric Construction Co., Ltd.

Croydon.—Tramways Committee. Recommended:—
12 sets motor equipment, brakes, &c. (£4,825).—British Thomson-Houston Co., Ltd.

Ilford.—Electricity Committee.
Transformer kiosk (£274).—Foster Engineering Co. (Accepted.)
500-kW rotary converter, 500-kVA transformer and other plant for Ganty Hill sub-station (£4,160).—Metropolitan-Vickers Electrical Co., Ltd. (Accepted.)
1,000-kW La Cour converter (£3,000).—Ateliers de Constructions Electriques de Charleroi.
(The recommendation for a 1,000-kW La Cour converter was referred back for the Committee to obtain further tenders.)
2½ miles assorted cable and 24 miles of cable.—Power and Lighting Cables, Ltd. (Accepted.)
1 mile and 4 miles of cable.—Union Cable Co. ((Accepted.)

Lancaster.—Town Council. Accepted:—
L.p. cables for the Bowerham district.—British Insulated Cables, Ltd.

Leeds.—Tramways Committee. Accepted:—
40 partial electric equipments for new rolling stock (£16,120).—General Electric Co., Ltd.
80 drum type controllers (£3,600).—English Electric Co., Ltd.
Special track work (£1,620).—Hadfields, Ltd.
Electricity Committee. Accepted:—
Sub-station switchgear (£740).—West Leeds Engineering Works.
2,000 house cut-out boxes (£812).—Yorkshire Switchgear & Engineering Co., Ltd.
1,000 house cut-out boxes (£425).—Macintosh Cable Co., Ltd.
2,000 house service boxes (£919).—Cole, Marchent & Morley, Ltd.

Leicester.—Baths Committee. Accepted:—
Installation of electric lighting at Bath Lane baths (£332).—J. E. Lester.

Lamp Contracts.—The Southern Railway has placed a contract for "Cosmos" lamps for six months with Metro-Vick Supplies, Ltd. The London, Midland & Scottish Railway, Northern Counties Committee, Belfast, has placed a contract for a 12 months' supply of electric lamps with the General Electric Co., Ltd.

London.—Admiralty.
10,000 inert cells.—Edison Swan Electric Co., Ltd.

General Post Office.—The contract for the battery for the Manchester trunk telephone exchange has been awarded to the Alton Battery Co., Ltd.
14,000 lampholders.—Edison Swan Electric Co., Ltd.

Battersea.—Electricity Committee. Accepted:—
3 h.p. cubicles (£252); e.h.p. busbars (£472).—Ferguson, Pailin, Ltd.
50-ton overhead crane (£2,050).—H. Morris, Ltd.
Belt conveyors (£1,522).—Babcock & Wilcox, Ltd.

Manchester.—Electricity Committee. Accepted:—
Cables.—Standard Telephones & Cables, Ltd.; Siemens Bros. & Co., Ltd.; Hackbridge Cable Co., Ltd.
Converting plant for sub-stations.—Mather & Platt, Ltd., sub-contractors for transformers, Ferranti, Ltd.; Metropolitan-Vickers Electrical Co., Ltd.; Bruce Peebles & Co., Ltd.
Wiring for lighting and power, the offices, stores and workshops at High Street depôt.—John Collier & Co. (Electrical Engineers), Ltd.
Electric battery type motor tower wagon.—General Vehicle Co., Ltd. Sub-contractors for body and tower ladder, S. Rawlinson, Ltd.; for Iron-clad battery, Chloride Electrical Storage Co., Ltd.
Tramways Committee. Accepted:—
50 tramcar motors.—General Electric Co., Ltd.
24 pairs maximum traction trucks.—Brush Electrical Engineering Co., Ltd.

Newark.—Town Council. Accepted:—
Mains and accessories (£21,987).—Macintosh Cable Co., Ltd.
Two transformers (£632).—British Thomson-Houston Co., Ltd.
11,000-V switchgear (£1,574).—Ferguson, Pailin, Ltd.

Portland.—Urban District Council. Accepted:—
One 50/75-V dynamo, with switchboard, battery, &c., also electric lighting installation at the main waterworks station (£106).—Smith & Son.

Ripon.—Board of Guardians. Accepted:—
Installing electric lighting at the Institution (£994).—Cox-Walkers and Partners.

Rosyth.—
Electrical installation at the new St. Andrew and St. George Episcopal Church.—R. Bell.

Salford.—Electricity Committee. Accepted:—
4,500 yd. l.p. cable (£1,498).—Nederlandsche Kabelfabriek.

Tynemouth.—Electricity Committee. Accepted:—
Oil separator (£171).—De Laval, Chadburn Co., Ltd.

Forthcoming Events.

Ideal Home Exhibition.—At Olympia, W. March 2nd to March 27th.

Junior Institution of Engineers.—Friday, March 5th. At 39, Victoria Street, S.W. At 7.30 p.m. Paper, "Tendencies in Modern Electric Practice," by Mr. J. M. Seddon. Special meeting of the Institution at the Engineers' Club, Waterloo Street, Birmingham. At 7.30 p.m. Paper by Mr. C. H. Woodfield on "Hoisting Appliances."

Electrical Power Engineers' Association (Southern Division).—Friday, March 5th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 7 p.m. Lecture on "A 50,000-kW Parsons Reaction Turbine," by Mr. C. D. Gibb.

Association of Mining Electrical Engineers (Western District Sub-Branch).—Saturday, March 6th. At 62, Wind Street, Swansea. Debate on "D.c. *versus* A.c. for Colliery Practice," to be opened by Messrs. G. W. Walton and H. Thomas.

(London Branch).—Saturday, March 13th. Visit to Chislett Colliery at the invitation of Mr. J. W. Robinson. Paper, "Some Notes on the Electrical Plant at Chislett Colliery," by Mr. C. Dawson.

Royal Institution—Saturday, March 6th. At 21, Albemarle Street, W. At 3 p.m. Lecture on "The Rare Gases of the Atmosphere," by Sir Ernest Rutherford.
Friday, March 12th. At 9 p.m. Lecture on "Radiation from Electric Discharges," by Sir J. J. Thomson.

Institution of Electrical Engineers.—Informal Meeting.—Monday, March 8th. At the Institution, Victoria Embankment, W.C. At 7 p.m. Discussion on "A Recent Development in a.c. Apparatus," to be opened by Mr. F. Creedy.

(Scottish Students' Section).—Friday, March 5th. At the Royal Technical College, Glasgow. At 7.30 p.m. Ordinary meeting.

(North-Eastern Centre).—Monday, March 8th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "Electro Farming; or the Application of Electricity to Agriculture," by Mr. R. B. Matthews.

(North-Western Students' Section).—Tuesday, March 9th. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Ordinary meeting.

(North-Midland Centre).—Tuesday, March 9th. At the Hotel Metropole, King Street, Leeds. At 7 p.m. Address by the president, Mr. R. A. Chattock.

(Scottish Centre).—Tuesday, March 9th. At the North British Station Hotel, Edinburgh. At 7 p.m. Paper on "An All-Electric House," by Prof S. P. Smith.

(South-Midland Centre).—Wednesday, March 10th. At the University, Birmingham. At 7 p.m. Paper on "Electro Farming; or the Application of Electricity to Agriculture," by Mr. R. B. Matthews.

(Dundee Sub-Centre).—Thursday, March 11th. At the University College, Dundee. At 7.30 p.m. Paper on "Cable Troubles," by Mr. A. F. Stevenson.

(Irish Centre) (Dublin).—Thursday, March 11th. At Trinity College, Dublin. At 7.45 p.m. Paper on "Recent Developments in the Production of Synthetic Ammonia," by Dr. J. F. Crowley.

(North-Western Centre).—Tuesday, March 16th. At the Engineers' Club, Manchester. At 7 p.m. Annual general meeting.

Association of Engineering and Shipbuilding Draughtsmen (Birmingham Section).—Wednesday, March 10th. At the Chamber of Commerce, Birmingham. At 7.30 p.m. Lecture on "Boiler House Layout and Management," by Mr. P. S. Wooley.

Institution of Engineers-in-Charge.—Wednesday, March 10th. At St. Bride Institute, Bride Lane, E.C. At 7.30 p.m. Paper on "Modern Laundry Machinery," by Mr. E. A. Alliott.
Saturday, March 6th. Bohemian concert.

Birmingham Electric Club.—Friday, March 12th. At the Grand, Hotel, Birmingham. At 7 p.m. Annual dinner.

Physical Society of London.—Friday, March 12th At the Imperial College of Science, South Kensington. At 5 p.m. Ordinary meeting.

Institution of Automobile Engineers (Wolverhampton Centre).—Tuesday, March 16th. Paper on "Electric Ignition Equipment," by Capt. A. C. Burgoyne.

(London Graduates' Section).—Thursday, March 18th. Paper on Electric Lighting and Starting," by Mr. S. T. Henn.

Porcelain Insulator Manufacture.

Impressions of a Visit to Messrs. Taylor, Tunnicliff & Co.'s Staffordshire Factories.

Founded in 1867 for the production of general porcelain, the firm of Taylor, Tunnicliff & Co., Ltd., has been associated with the production of electrical porcelain ever since the manufacture of electrical plant and accessories became a commercial proposition in this country.

The founder of the Company was Mr. Thomas Taylor, who was chairman and managing director until the day of his death in 1919. The present chairman and managing director is Lt.-Colonel W. J. Kent,

Fig. 1.—The New Factory at Stone.

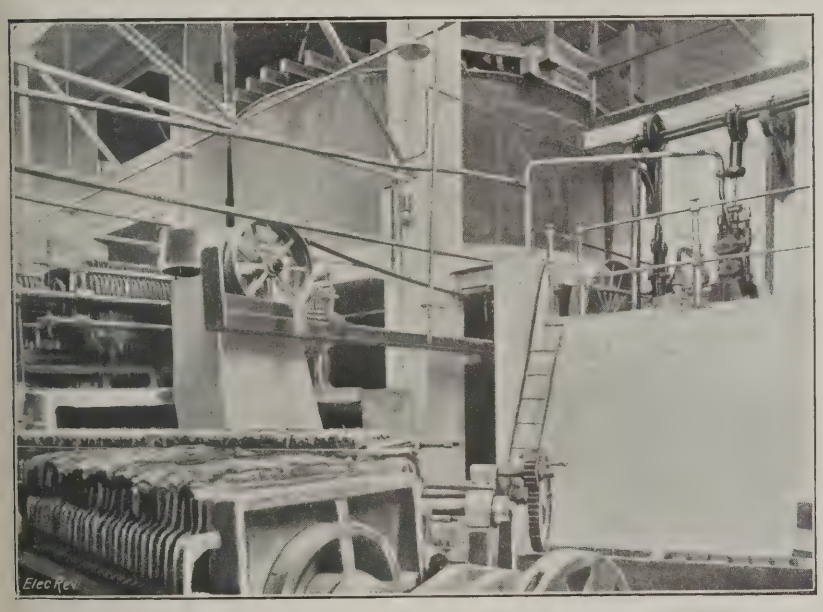

Fig. 2.—Raw Materials Grinding and Mixing Plant, showing some Filter Presses.

with Mr. A. E. Wilbraham as assistant managing director. Mr. M. J. Dark, A.M.I.E.E., is the resident London director, and Mr. P. Cooper is general manager and director. To-day over 90 per cent. of the firm's output is electrical, almost every pattern of insulator being made in its three factories at Longton, Hanley (Stoke-on-Trent) and at Stone, which afford employment for nearly 1,000 people. The last-named works, fig. 1, which are capable of producing 100,000 finished insulators per week, are situated just outside The Potteries. These works are new and are laid out on one floor to facilitate transportation. They are a striking example of the influence that modern equipment (in the form of belt and other conveyors, special machine tools, &c.) has on the reduction of production costs.

The raw materials, canal-borne Cornwall clays and "stones," flints, felspars, &c., from Norway and Sweden, are first crushed and ground exceedingly fine in water. To ensure intimate mixing of the ingredients, the liquid is run into 30-ton underground concrete tanks, and compressed air is circulated through it by means of a system of pipes so arranged that currents and counter currents are formed; this method is quicker and more efficient than the use of mechanical agitators, and the clay being suspended in the water in very small particles does not absorb air, which escapes through the water. On its way to the filter presses, the liquid flows through troughs containing a large number of magnet "combs," which remove particles of iron, &c. The type of pump used to feed the filter presses is interesting in that the vertical ram is cam-lifted and carries a heavy weight at its lower end for the return stroke. As the press becomes filled with clay, the pressure increases and consequently the stroke of the pump decreases in length until the pressure (120 lb. per sq. in.) balances the weight, when the pump automatically ceases to function. The above processes are continuous and result in the production of plastic clay, which is next broken up and undergoes "pugging," an important process that forces the air out of the clay. The material is divided at this stage for the manufacture of accessories and e.h.t. insulators: For instance, porcelain rods and tubes are extruded by means of hydraulic presses at pressures of from 4 to 10 tons.

For casting purposes it is broken up again and then mixed with various chemicals in order that its weight (solid content) may be increased,

Fig. 3.—Part of Insulator Casting Department.

at the same time preserving its fluid state. The resulting liquid flows through the system of piping shown in fig. 3 into plaster of Paris moulds, the air

being driven out as the mould fills. Moisture is absorbed by the plaster mould, and when the required thickness of solidified clay has been deposited, the liquid clay remaining in the centre is run off. When sufficiently set to stand handling, the mould is removed and the formed insulator allowed to dry before being trimmed, glazed, fired, &c.

Another process is to dry and grind the clay in order that it may be used for press work; the plant for this is capable of producing 80 tons of "dust" per week; small articles, such as switch bases, ceiling roses, fuse handles, and the like, being produced by means of hand presses. Fig. 5 is a view of the press shops.

Yet a third method is to use the clay in a plastic condition. In certain cases the clay is first manipulated by hand by a highly skilled potter with the aid of his wheel (see fig. 8), a very fascinating process to watch, the object being to get rid of any air which may still be in the clay; this is of the utmost importance, and the preliminary shaping of the insulator being made is done at the same time. From this stage the articles are passed to another skilled potter to be turned on a lathe (see figs. 4 and 6), and it is this operation which finally shapes the insulator.

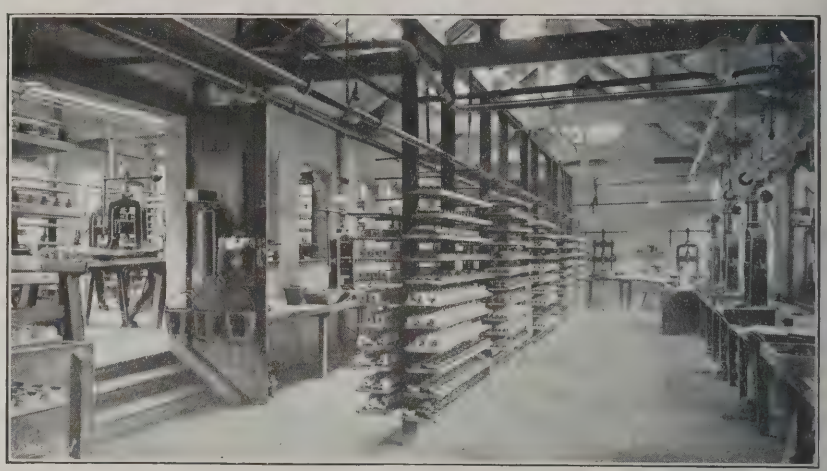

Fig. 5.—A View of the Press Shops.

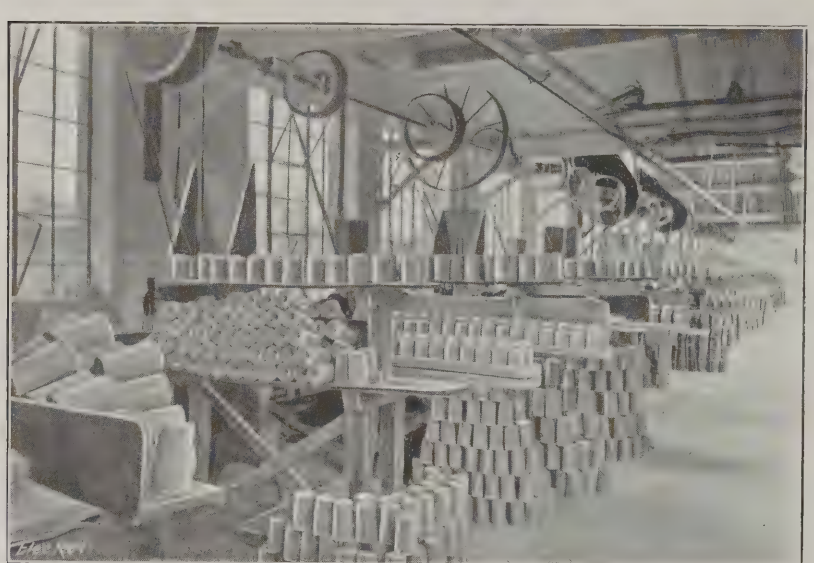

Fig. 4.—One of the Machine Turning Shops.

Another way in which the plastic clay is formed is known as "jollying." This operation may be termed a mechanical one. The clay is put into a plaster mould which revolves and determines the outside shape of the insulator being jollied; a tool of correct form is brought down into the revolving clay mass, impresses it on the side of the mould, and thus shapes the interior and exterior at the same time. In the new factory, however, all these processes are done by machinery.

Particularly in the case of the manufacture of telegraph, telephone, and similar insulators, all the operations of preliminary shaping and the final turning are done by girls, who become quite expert. Many of these machine tools have been specially designed by the Company's staff. Some of the jigs are extremely complicated, alike for lathe turning, drilling, and press work, the cost of which, however is well balanced by the economy and speed of machine production as compared with the older hand method. All the scrap material from the lathes and presses is reclaimed for further use.

It is of interest to note that the turning of the larger products is all done to scale within close limits. The turner works to blue-print drawings, and an article which may weigh 140 lb. may emerge as a finished product weighing only 40 lb. The large bowl-shaped wireless insulators shown in fig. 7 are some of the types made by the Company; to keep them within the fine limits demanded, certain surfaces are ground after firing. A large and well-equipped tool room is maintained, and something like 14,000 pattern numbers are in use, many of them intricate and involving some 50 patents. The drying process which every article has to undergo at more than one stage of its manufacture is carried out in steam-heated and hot-air rooms, and in the case of the larger insulators may last for a number of days, even weeks. Glazing is done by hand, fig. 12, the operator knowing just how long each article should be immersed from experience, according to the weight per pint of the glazing liquid, which may be white, brown, or green, as desired.

The firing process is almost the last operation. This vitrifies the insulator, giving it its insulating properties, the glaze not being depended on for this purpose; it merely gives the article a finished appearance and keeps it clean. Placed in fireclay receptacles, the insulators are stacked in tiers inside the kilns, the tem-

Fig. 6.—Part of the Turning Department.

perature control of which is a very delicate operation. In the older coal-fired kilns the control is obtained visually by watching the degree of melting of strips of clay of various qualities. In the new works, however, fig. 14, the kilns are producer-gas fired; the temperature is controlled by Cambridge pyrometers, the flue exhaust gas temperature being also recorded as well as the in-going gas pressure and quality. The chimney draught is automatically controlled by a very sensitive Arca regulator; it consists of a diaphragm, one side of which is in connection with the kiln side of the flue, the other side of the diaphragm being subjected to water pressure. Should climatic conditions (high winds, &c.) affect the draught, the balance of the diaphragm will be upset, which causes the flue damper to be automatically opened or closed, according to its prior setting. Each kiln, as it is newly filled and sealed, before the gas is turned on to it, is pre-heated to about 700 deg. C. by means of the exhaust gases from the kilns already being fired. After a period, the gas is shut off and the temperature begins to fall; at first fairly rapidly, then it remains steady for a time. At this point the insulator is finished, and in order to save time the kilns are cooled forcibly by the introduction of cold air, the hot air extracted being used for the drying rooms and other heating purposes.

Fig. 7.—Large Wireless Insulators being Ground to Close Limits.

When an article is required to be printed with the maker's name, voltage, &c., an engraved copper plate is made which transfers the pattern to very thin strips of paper. The paper is laid over the insulator and washed off, leaving the pattern on the surface of the insulator; various colours may be used if required. The insulator is then fired a second time, so as to enamel it. This second firing need not be at a high temperature, about 800 deg. C. sufficing. In the older method two firings were necessary—one known as biscuit and the other the glaze. In the majority of cases, however, the modern methods used by Messrs. Taylor, Tunnicliff & Co. necessitate only one firing, which is a consideration in view of the fact that 12 tons of coal are needed per kiln, the firing being an expensive item in the manufacture of electrical porcelain. Firing is quite an art, for the insulators, especially the larger sizes, have to be placed in specially-shaped supports to prevent strains which would lead to distortion being set up while at high temperature that would cause cracking and fracture. Over firing would cause "boiling," which is a cause of porosity.

High-voltage insulators have been made by the Company for a quarter of a century. The development of e.ht. line insulation is naturally of more recent growth, but, once the demand for it materialised, modern equipment was installed and a specialist department created for the production and testing of this class of insulation.

The manufacture of efficient transmission line insulation necessitates close co-operation between the potter and the electrical engineer. The former's business is to control the mixing and firing of clays so as to produce

Fig. 9.—One of the Warehouses, showing Telegraph Insulators.

Fig. 8.—A Potter at his Wheel.

Fig. 10.—Part of the Toolroom.

the requisite "body" for high-voltage work, while the latter designs and arranges the product to give efficient service. The "body" of which the Company's insulators are made, and the methods employed in shaping and firing them, result from long experience. The

Fig. 11.—One of the Drying Rooms.

strength of porcelain may be gauged from the fact that radio-aerial strain insulators are made to withstand a pull of 15 tons. It was a natural development for the pin-type power insulator to follow the telegraph pattern; modern practice is to use the pin-type for working pressures up to 33 kV; the T. & T. range has been standardised up to 66 kV, though there are one or two examples of such insulators functioning satisfactorily on 88-kV lines. The spindles are mild-steel hot-galvanised forgings of two standard strengths and having elastic limits of 1,000 and 2,000 lb. respectively. No cement is used to attach the spindle to the insulator.

To guard against the destructive mechanical stresses which are liable to be set up in insulators composed of three elements, *viz.*, porcelain, metal, and cement, each of which has a different co-efficient of expansion, a resilient medium is inserted between the three materials. The cement used is chiefly Portland, requiring a week or more to set, but a special composition is used in the case of insulators that have to withstand hot oil under pressure.

Metal-hooded suspension and strain insulators are regarded as the standard wherewith to insulate extra-high-tension overhead lines; on a few important systems the interlinked (cementless) type has been em-

Fig. 12.—Part of the Glazing Department.

ployed, but they are in the minority. The number of units per insulator string theoretically increases in more than direct proportion to the voltage, since the units nearest the line carry more of the electric stress than those at the earth end of the line. This effect, however, does not become of any magnitude until, say, six units in series (corresponding to a working voltage of 110 kV) are employed; so at ordinary voltages the number of units per string may be considered to vary in direct proportion to the working voltage. As above-mentioned a resilient medium is used between metal and porcelain to take up the difference in expansion with changing temperature. All modern insulators are designed to flash-over away from the body of the insulator without the aid of arcing horns; nevertheless, under exceptional climatic conditions, the arc may cling to, and destroy, the body, unless horns are provided. Such horns may be used with metal-hooded insulators, but arcing devices for pin insulators are seldom desirable.

Space considerations do not permit of the many and diverse products of Messrs. Taylor, Tunnicliff and Co. being mentioned. They include insulators for wireless, post office telegraphs and telephones, electric railways, and other purposes. It may be noted, however, that electric heater elements are made by the Company which can be safely immersed in water when at a red heat.

Fig. 13.—A Well-stocked Warehouse.

Testing facilities are, of course, an essential feature of such an organisation; they will be illustrated and

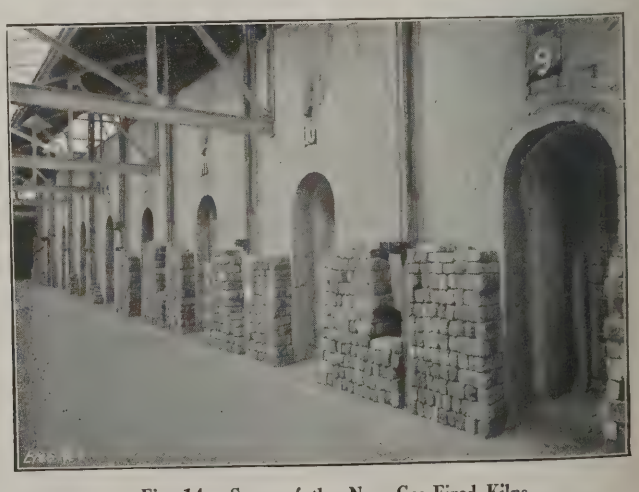

Fig. 14.—Some of the New Gas-Fired Kilns.

referred to fully in a later issue.

(*To be concluded.*)

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

RITEHEAT electric irons.

Resins for soldering purposes (in quantity).

Notes.

Meter Engineers' Association.—We have received a copy of the Rules of the Meter Engineers' Technical Association (ELECTRICAL REVIEW, January 29th, 1926; p. 183). It is proposed eventually to circulate the proceedings of the Association to all members and associate members, and the Council has decided to institute a technical information bureau, through which members may receive unbiased information regarding the apparatus they are called upon to handle.

Local Societies.—EDINBURGH ELECTRICAL SOCIETY.—A lecture was given before the Society on February 17th by Mr. Allan Arthur on hydro-electric plant. Mr. J. G. Burchell, president of the Society, occupied the chair, and the lecture proved to be most interesting.

TRAMWAYS *v.* 'BUSES.—The monthly meeting of the Paisley Association of Electrical Engineers was held on February 23rd, when a very large gathering of members and friends listened to a debate on "Tramways *versus* 'Buses." Mr. W. R. Bruce, of the Glasgow Corporation Tramway Department, upheld the case for tramways, and Mr. Peter Hamilton, jun., of Messrs. Hamilton Brothers, took up the cudgels on behalf of the 'bus proprietors. Mr. Bruce quoted figures and facts in support of tramway travel as against the prevailing fashion to travel by 'bus. Mr. Hamilton gave statistics of costs to show how cheaply 'buses could be managed, as compared with tramways, and pointed out the many advantages of 'buses with regard to comfort, speed, and flexibility which were, he said, all against tramways. After tea a lively discussion was entered into by Messrs. Scott, Coats, Heys, Todd, Young, Hutcheson, and M'Geoch. Mr. Bruce and Mr. Hamilton replied to the discussion ably, and in the general summing up opinion was fairly divided as to the merits of each side.

Electricians' Strike.—Some 80 electricians employed at Devonshire House, London, struck work on March 2nd. The complaint was that work which fitters were doing at the rate of 1s. 3½d. per hour was electricians' work, for which the Union's rate was 1s. 10d. Some 600 other workmen went on strike in sympathy with the electricians.

The I.E.C. and the Electricity Supply Bill.—According to the latest information, the Government's Electricity (National Development) Bill will be circulated to Members of Parliament about the middle of next week, and the second reading will take place on March 23rd. As reported in our issues of January 15th (p. 108) and February 12th (p. 265), the plenary meeting of the International Electrotechnical Commission in New York commences on April 13th and continues until about the 22nd, after which the delegates will embark on a tour of 2,500 miles in the United States and Canada, ending on May 8th. Thus the British delegates will be absent from this country from the beginning of April to the middle of May—the very time when the Bill is before Parliament. Owing to this unfortunate clashing of events, we believe that several of our most prominent electrical engineers who were to have served as official delegates at this exceptionally important meeting of the I.E.C. will be compelled to remain in England, greatly to the detriment of British influence in the I.E.C. discussions.

Presentation to Mr. Harry Booth, O.B.E.—On Friday last, at the Institution of Electrical Engineers, a meeting was held for the purpose of making a presentation to Mr. Harry Booth, on his retirement from the public service last year.

Sir Harry Renwick, K.B.E., presided, and in opening the proceedings, said that they were assembled to show their regard for a much respected public servant who had served his country in general, and the electric supply industry in particular, for over 40 years with unstinted devotion. Mr. Harry Booth entered the public service in 1882, the year which gave birth to the first Electric Lighting Act; Mr. Booth was not responsible for that Act, many clauses of which were so ill-designed, but he had been mainly concerned with it and subsequent Acts throughout his career, and carried on his work as head of the Electricity Department of the Board of Trade all those years practically single-handed. It was in respect of that work that they were honouring him that day. The position had been a most difficult one, having regard to the diverse interests affected, but Mr. Booth had at all times shown a high sense of the responsibilities of his office, and had always been true to the best traditions of public life. He was always tactful, courteous, helpful, and absolutely impartial, and was a splendid type of the Civil Servant of this country, a body of which they were all so justly proud.

Sir Harry then read an address inviting Mr. Booth to accept a piece of plate and the cordial congratulations of the contributors on the completion of 43 years of public service, covering almost the entire history of electricity supply in Great Britain. The address pointed out that his intimate knowledge of the Electricity Acts and Regulations governing electrical enterprise had been of the greatest value and assistance to the electrical industry, and the signatories expressed their deep appreciation of the loyal and painstaking service that he had rendered to the development of the industry.

An album containing the signatures of the 86 contributors to the presentation, including many of the most eminent members of the profession and industry, was handed to Mr. Booth, together with a handsome piece of plate and personal souvenirs.

At the invitation of the chairman, Sir George Hume, M.P., L.C.C., M.I.E.E.; Mr. R. A. Chattock, president I.E.E.; Mr. Alderman Duncan Watson, M.I.E.E.; and Sir Tom Callender, M.I.E.E. paid personal tributes to the merits of Mr. Booth, who then expressed his gratitude for the presentation, the generous terms of the address, and the kind words which had been spoken. It was embarrassing, he said, after 40 years of public service in a position involving adverse decisions, to meet with nothing but eulogy. He had experienced the greatest kindness and consideration from his chiefs and colleagues. He entered the Electricity Supply Department in 1890, and had been closely concerned with the subsequent Acts; the clause of the Act constituting "Fringe Orders" was his invention. He had a horror of red tape, and always administered the law with all the elasticity that was possible; he had "tried to help," and felt that he had had a measure of success.

Mr. Sydney Morse proposed a vote of thanks to the chairman, who was the originator of the movement, the great success of which was due to him. Sir Philip Nash supported the proposal, which was unanimously adopted, and Sir Harry briefly acknowledged the compliment.

Educational.—UNIVERSITY OF MANCHESTER, FACULTY OF TECHNOLOGY.—A scholarship in electrical engineering, of the value of £50 per annum for three years, which has been endowed by the executors of the late Lewis Atkinson, will be offered this year. Forms of nomination and application, returnable by April 1st, may be obtained from the Internal Registrar, The University, Manchester. (See our advertisement pages to-day.)

E.h.p. Rectifying Valves.—Indication of the progress which has recently been made in the application of valves for extra-high-pressure rectifying purposes is given by the production of two new types by the General Electric Co., Ltd., They are known respectively as the Osram valve type-E.H.T.1, and Osram valve type-E.H.T.3. No. 1 is a 2-electrode valve that will withstand a maximum peak reverse pressure of 80,000 volts, equivalent to an input voltage of approximately 28,000 volts r.m.s., or 40,000 volts on a capacity load. The maximum anode current that may be taken from the filament is 200 milliamps. r.m.s., but the manufacturers advise the inclusion of a protective resistance in series with the anode circuit; for cable testing this protective resistance should be approximately 1 megohm. Although this valve is designed primarily for cable-testing purposes, it may be employed to replace mechanical rectifiers in all cases when the rectification of high voltages is desired. The overall length of the valve is 365 mm. and the maximum diameter of the bulb is 160 mm. Its impedance is approximately 1,800 ohms; its maximum filament voltage is 17, and its filament current 10 amperes.

Like the E.H.T.1, the larger valve bearing the numeral 3 is supplied with a plain anode cap, and an Edison screw cap for filament connection. Type 3 is also a 2-electrode valve, built to withstand a maximum peak reverse voltage of 150,000 on a resistance load, or 75,000 volts peak on a capacity load. The maximum anode current that may be taken from the filament is 100 milliamps. peak value, and it is necessary for a protective resistance of the order of 1 megohm to be included in series with the anode circuit. The impedance of the valve is so low, *viz.*, approximately 750 ohms, that there is no visible sign of heating of the anode under normal working conditions; the maximum filament voltage is 8 volts, and the filament current 8 amperes. The valve is 530 mm. overall, 180 mm. in diameter, and its weight only 3 lb.

Dinner.—The dinner of the Ex-British Westinghouse Association takes place to-night (Friday) at the Holborn Restaurant, London.

The Economics of the Electricity Bill.—Sir Arnold Gridley, speaking at the annual dinner of the Preston and District Chamber of Commerce on Thursday last week, referred to the Government's Electricity Bill, and said that what was troubling him and many others was the question how electricity was to be rendered cheaper when it was proposed to set up a new board below the Electricity Commissioners, but above the existing municipal and company authorities, and when a large capital sum would have to be found for the construction of new stations and for the "grids" of interconnecting cables and for the standardisation of frequency.

Association of Mining Electrical Engineers.—IRON-ORE MINES.—At a meeting of the West of Scotland Branch of the Association Mr. Arthur Dixon dealt with the electrification of the Hodbarrow iron-ore mines, prior to which, he remarked, the annual coal consumption was approximately 13,000 tons, representing a cost of about £20,000. It was estimated that the electrified plant would account for 10,000 tons per annum, of which 3,000 tons would be used by the "broken ground" pumps, the approximate saving in coal being 5,000 tons, which represented £6,000 per annum. It was explained that the fuel originally used in the "broken ground" was now providing the complete electrical requirements of the mines, and there was a further saving in boiler attendance and upkeep.

Appointments Vacant. — Assistant electrical engineer (£310+) for the Admiralty service. Practical electrician for the Leeds City Police Fire Brigade. Probationary assistant telegraph engineer for the Government of the Federated Malay States. Senior switchboard attendant for the Borough of Derby Electricity Department. One meter repairer and tester for the Worksop Urban District Council Electricity Works. Relief shift engineer, for the North Metropolitan Electric Power Supply Co. (See our advertisement pages to-day.)

Electricity in Agriculture in Belgium.—With the object of encouraging the use of electricity in connection with farming operations, the Comice Agricole of Mons has recently organised a series of lectures on the subject for farmers and farm workers. The first lecture was given at the Provincial Technical School in Mons, but the subsequent ones are being delivered at different farms where electricity is already in use, so that the students are given practical demonstrations of the use of different classes of electrically-operated agricultural machinery and implements.

Institution Notes.

Institution of Electrical Engineers.—Informal Meeting.—Mr. H. T. Young was in the chair at the informal meeting on Monday, February 22nd, when Mr. A. F. Harmer opened a discussion on "Some Changing Characteristics in the Application of Electricity to Public Supply." This in the main was a description of the development of the supply company with which he is associated, especially emphasising the necessity of economy in distribution costs, and details of some new gear, designed with this object in view, were given. In a brief outline of the history of the Metropolitan Electric Supply Company he described the maze of systems which had been inaugurated at one time or another. At the present time power is only generated at Harlesden, and in the near future all the energy leaving that station will be at 20,000 volts, 3-phase, 50 cycles. The company's western area covers 400 square miles, and in the last few years about 100 miles of 20,000-volt, three-core cable has been laid. To visit the 17 sub-stations, taking the shortest possible route by road, involves a journey of 120 miles. The e.h.p. cables are armoured and laid direct in the ground, and are followed throughout with an armoured cable containing the screened pilots for the Beard-Hunter protective system and two pairs of telephone wires. The centre, or voltage pivot, is Uxbridge, where the voltage is maintained at 20,500 V; this ensures other places getting their correct voltage.

The secondary system of mains is at 6,600 and 3,300 volts; the latter will be raised to the former as soon as convenient. Places like Acton, Brentford, &c., have a network of these mains, stepping down to 415/240 volts either on consumers' premises or in kiosks; this is also in process of being carried out in Paddington. Some of the places supplied take the supply in bulk, and distribute according to local methods. Wherever there is a step down from 20,000 to 6,600 volts, there is a standard metering panel, which is, where necessary, reciprocal; that is, the metering scheme takes care of current either flowing out from, or into, the system.

One of the greatest difficulties supply authorities experience is the lack of depth in going over bridges, whilst other authorities have occupied the greater part of the available space. A 20,000-volt cable has had to be laid direct in the River Thames on this account. In other places, railway embankments have had to be tunnelled under, either in the usual manner or by the use of the thrust borer; this has also been used in town for crossing under tram-lines, &c.

A considerable mileage of the cables is laid in the canal towing paths. More than one burn-out has been due to the bargees driving steel mooring stakes into them, notwithstanding what was thought to be ample protection.

Mr. Harmer stated that public supply authorities should install their own system of telephonic communication, in view of the possibility of serious damage to plant, interruption of supply, and serious risk of loss of life in the event of a breakdown, when instant communication was vital, and said that it was a regrettable fact that few supply authorities had anything but quite feeble methods of telephony, due, no doubt, to the lack of appreciation by heavy engineers of the fact that telephonic apparatus and cables must be of the first order, chosen, installed, and maintained, with the same amount of thought and care as e.h.p. gear: in fact, more so, as 20,000-volt gear gave clear indications when matters were not satisfactory. Mr. Arthur Wright asked for figures of capital cost per kW, and whether the possibility of overhead transmission had been considered. Messrs. H. T. Young, P. Dunsheath, W. E. Rogers, W. A. Erlebach, R. V. Hook, W. Lunn, and M. D. Hart also took part in the discussion.

Association of Consulting Engineers (Inc.).—Annual Dinner.—The annual dinner of the Association was held at St. Stephen's Club, Westminster, on Thursday last week, the chairman of the Committee, Mr. E. W. Monkhouse, M.Inst.C.E., presiding over an attendance of about 150 members and guests. After the loyal toast, Mr. C. G. Du Cane, M.Inst.C.E., proposed the toast of "The British Empire," to which, in the unavoidable absence of Lt.-Col. Wilfrid Ashley, M.P., Sir Henry Slesser, K.C., M.P., responded. He remarked that the prosperity of the British Empire was a matter outside party politics; the Labour Party was as solicitous for the welfare of the Empire as any other party. Sir Joseph Cooke, G.C.M.G., High Commissioner for the Australian Commonwealth, also responded. He referred to a Conference of Dominion representatives, to be held in October next, which he described as a meeting of "political consulting engineers." The time was not yet ripe to establish one common council to prescribe for the Empire in all its ramifications; they could not make a piece of machinery to fit an organism, a corporate body with a soul. He welcomed the development of wireless communication and aviation as shortening the distance between the ends of the Empire.

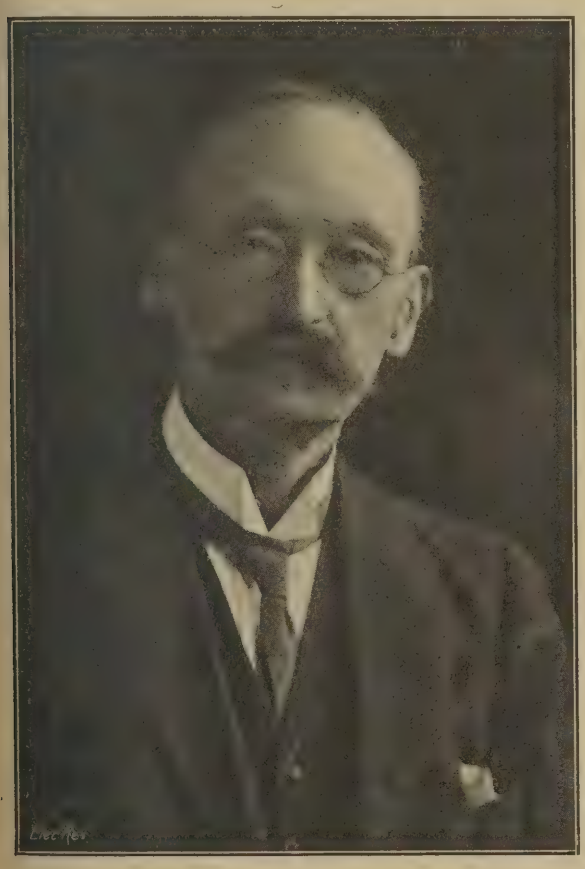
The toast of "Science" was proposed by Mr. S. C. Lewis, M.Inst.C.E., who said that it was the function of the engineer to apply the findings of the scientist. Sir Ernest Rutherford, O.M., president of the Royal Society, responded, describing physical science as the mother of engineering. The use of the electron, he said, was now a branch of engineering; the same was true of wireless and radiography. Engineering was flourishing, whilst the fruitful mother continued to live in a frugal way. If science had helped engineering, it was true also that engineering had helped science, providing it with better methods and better apparatus for research. He had recently re-visited Australia and New Zealand, and was greatly impressed by the work of the engineers and their courage in designing enormous structures such as the great bridge across Sydney Harbour and the electrical works that were in progress at Arapuni and on the Waikato River. The development of engineering depended on the progress of pure science, and enormous changes had taken place in 30 years, due to the influx of new ideas from University laboratories. Science to-day was more active than ever before; there was a great wave of advance every year, and the problems of the properties of matter and the structure of the atom were being attacked all over the world. The results that would be obtained would have an immense influence on engineering, and he pointed out that the wealthy industries should therefore contribute to the support of the frugal mother.

Mr. A. H. Preece, M.Inst.C.E., proposed the toast of "Law," remarking that law was the "engineering" of human nature. Mr. Justice McCardie responded, pointing out that physical truth was the quest of scientists and engineers, whereas judges sought to discover the truth with regard to facts—a far more difficult problem. He claimed that fearlessness, honesty, and independence were the basis of the English judicial system. Sir Lynden Macassey, K.B.E., K.C., also responded, tracing the origin of engineers and lawyers from a common source. For the benefit of the Bar he recommended that engineers should continue to draw up their own contract clauses.

Mr. W. B. Clode, K.C., proposing "The Association of Consulting Engineers," declared that engineers had done more to develop the civilisation of to-day than any other body of men. The chairman responded, describing the Association as keeping the conscience of the profession, its object being to maintain a uniform standard of professional practice. On behalf of the Committee he tendered warm thanks to the honorary officers, particularly the honorary secretary, Mr. A. H. Dykes.

Electrical Association for Women.—The Glasgow and District Branch of the Association on February 25th visited the Pinkston power station of the Glasgow Corporation Tramways Department and also the tram-car works at Coplawhill.

Junior Institution of Engineers.—Coal-cutting Machinery.—At a meeting of the Institution on February 19th, Mr. S. Reilly delivered a lecture on the subject of "Coal-cutting Machinery," beginning with a general description of the coal face and the methods of machine mining, and showed lantern slides to illustrate the "long-wall" and "heading" methods of working. Mr. Reilly explained that in Scottish mines the long-wall method of working had to be used on account of the small seams of coal, which varied between 9 and 14 in. The height of the roof above the pavement was, therefore, never much more than 2 ft. 6 in., and it would be impossible to work these seams with hand picks. A modern electric disk coal cutter weighed about 2¾ tons and had a motor of about 30 h.p. The disk ran at anything from 16 to 30 r.p.m., and forced lubrication was used. The machine was totally enclosed so as to be flameproof, although it was not necessarily gasproof; under the arduous conditions of working it was impossible to keep all joints absolutely tight. The cost of maintaining a machine was about 1.2d. per ton of coal worked, and the cost of power was about 2.5d. per kWh. The initial cost of the machine was about £700, when installed at the coal face, and its life depended much on the way it was treated. The chief troubles were electrical, and were greatly increased by abuse of the machine; the life of an armature was usually from four to five months. New machines were being made only 12 in. high and were adapted for remote control.



Institution of Public Lighting Engineers.—At a recent meeting of the Council, the programme of the annual meeting, which is to take place at Newcastle on September 14th, 15th and 16th, was considered and approved; it was decided to hold an exhibition on the first day, followed by a reception and a tour of inspection of the public lighting of the city.

On the second day, in addition to the president's address, papers will be read on "Public Lighting from a Motorist's Point of View," by Major Stenson Cook (secretary, Automobile Association); "Improved Lighting of a City," by Mr. J. F. Colquhoun, lighting engineer, City of Sheffield; "Hours of lighting," by Mr. R. Beveridge, City of Edinburgh; and "Electric Public Lighting," by Mr. John Christie, engineer and manager, Brighton Corporation Electricity Works. An excursion will take place on the final day.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. J. E. Kingsbury, M.I.E.E., to whom we are indebted for the very interesting article, "The Telephone—1876-1926," which appears in another part of this issue of the Electrical Review, has been closely identified with telephony during the greater part of his career—indeed, for practically the whole of the 50 years the completion of which is now being celebrated. Yet Mr. Kingsbury's numerous friends in the electrical world are unable to regard him as other than a young man in spite of his 71 years. His practical interest in telephony began in the year 1878, and commercially in 1883, when he started the British branch of the Western Electric Company, to whose interests he devoted his attention until 1910, when he retired from active management, though remaining a director. Recently he has resigned that position, and has limited his telephonic interests to the operating field as a director of several important telephone companies. In 1882 Mr. Kingsbury published a pamphlet entitled "The Telephone in Principle and Practice, its Origin and Development," and many other contributions to the literature of telephony have come from his pen. They have included various papers read before the British Association for the Advancement of Science and the Institution of Electrical Engineers, but his greatest work was the volume published in 1915 entitled "The Telephone and Telephone Exchanges," a book which has become a standard work of reference. He was awarded the Fahie Premium for his paper on Telephone Switchboards in 1895. He has been prominent in the counsels of the Institution of Electrical Engineers, of which body he is a past-vice-president, and a member of Council, and was honorary treasurer from 1915-1919. His close interest in the affairs of the Electro-Harmonic Society, the Electrical Engineers' Ball, and other social organisations of the profession and industry is well known and appreciated.

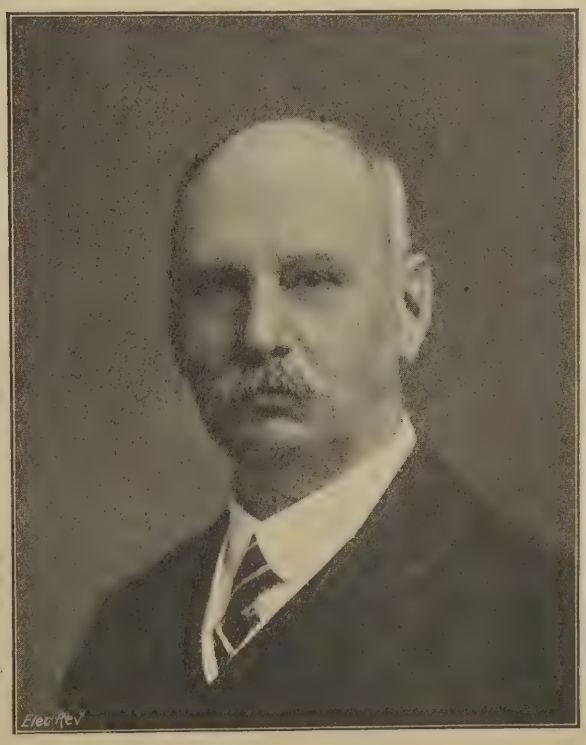
Mr. J. E. Kingsbury, M.I.E.E.

Mr. R. H. Campion, chief engineer of the Chesterfield Corporation electricity and tramways undertaking, has been appointed manager and engineer of the Torquay tramways, in succession to Mr. H. J. Nisbett, who has retired.

Mr. T. Brighouse has recently resigned his position as chief assistant to Mr. J. A. Robertson, M.I.E.E., M.I.M.E., consulting engineer, in order to take up a position as district representative of the Mitchell Conveyor & Transporter Co., Ltd. His address is St. John Chambers, St. John Street, Deansgate, Manchester.

The Board of Trade has appointed Mr. William Smith Jarratt to be Comptroller-General of Patents, Designs, and Trade Marks, in succession to Mr. W. Temple Franks, C.B., who retires as from March 1st on account of ill-health. Mr. Jarratt has been one of the assistant comptrollers at the Patent Office since 1921.

Mr. L. J. B. Forbes, electrical engineer at Kirk Sandall glassworks (near Wakefield) of Messrs. Pilkington Bros., Ltd., is shortly leaving to take up duty as electrical engineer at the same firm's headquarters' works at St. Helens, Lancashire.



The *Yorkshire Post* states that Mr. T. E. Price Stretche, of Preston, is retiring this month from the position of superintending engineer to the Post Office for the North-Western District of England, which he has held for fifteen years. Mr. Stretche will be succeeded by Mr. J. M. Shackleton, staff engineer of the G.P.O., London.

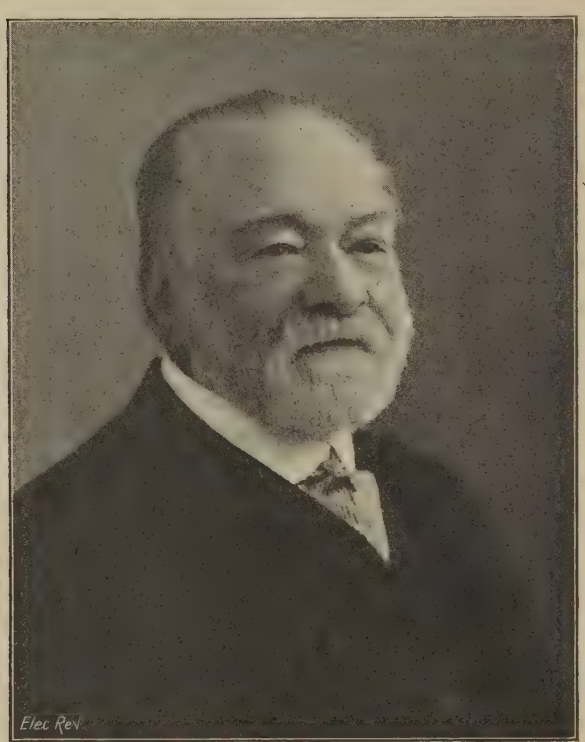
Mr. H. Burrows has resigned his position with the Liverpool Electric Cable Co., Ltd.

We understand that there is every prospect of Mr. Guy Burney's organising ability and driving power being again placed at the disposal of the electrical industry when a suitable opportunity presents itself. Many of our readers who are familiar with his achievements will welcome such a decision. Our readers will remember Mr. Burney's prominent association with the electrical industry during the past 25 years, especially as the founder and managing director of the Sterling Telephone & Electric Co., Ltd., from which undertaking he resigned in July last, as was stated in our pages at the time.

The International General Electric Company has appointed Mr. A. S. Durrant, formerly manager of the Department of the Americas, to be vice-president. Mr. James C. Ryan, formerly sales manager of the Department of the Far East, has been appointed general sales manager of the company.

Obituary.—Mr. Martin Roberts.—Mr. Martin Roberts, M.Inst.C.E., M.I.E.E., F.C.S., whose death it was our sad duty to record last week, was born at Lichfield toward the end of 1853. He was educated at King's College, London, and entered the Engineering Department of the Post Office in 1871, becoming inspecting engineer in 1873, superintendent of factories in 1880, and assistant engineer-in-chief in 1898. He retired from the Post Office in 1909. While in the Post Office he was responsible for the design of the P.O. factories and power stations. From 1898 onwards until his retirement in 1909, Mr. Roberts, in association with Mr. (afterwards Sir John) Gavey, was responsible for the whole of the engineering work involved in the establishment of the Post Office London Telephone system. The decision to provide the main channels of communication by means of underground plant produced many problems of a novel character, and to the solution of these Mr. Roberts contributed both a sound engineering knowledge, and a degree of foresight which evoked the admiration of all who took part in this pioneer work—the foundation on which the present extensive telephone system in London is based. He was a member of the Engineering Standards Committee, and of the Physical Standards Committee, and had contributed to the Journals of the Institutions of Civil and Electrical Engineers.

Elliott & Fry [*London.*



The late Mr. Martin Roberts.

During the war Mr. Roberts gave his services on the Engineering Staff of the Ministry of Munitions, for which he was made a Member of the Order of the British Empire. He was engaged during the Constantinople Exhibition at Olympia in reorganising the mechanical and electrical work of the building, and in designing the lighting of the large stage during the Kiralfy Exhibitions. He was responsible for the mechanical and electrical equipment of the re-built Trocadero.

In the early days of 3-phase alternating currents, he was sent by the Post Office to the Continent to report on the most recent Continental practice in connection with a proposal to provide a central power station for Post Office power and lighting, and was thanked by the Postmaster-General for the value of the report.

He was a man of great vitality and many interests, a keen yachtsman and collector of books, prints and etchings. He was also a prominent Freemason, holding Provincial Grand rank.

Mr. A. P. Lundberg.—Mr. A. P. Lundberg, the news of whose death reached us at the moment of going to press last week, was born at Ringby, Bjorneborgs Bruk, Sweden, in 1831, and had thus reached his 95 year. His early interest lay

Miles Kay] [*London.*

The late Mr. A. P. Lundberg.

in the direction of mathematical instruments ,but in 1855 he spent some time in France and then in Russia and Denmark in various electrical and other pursuits. Later he found employment in London and settled here in the early 'sixties. After working for several instrument firms here he entered the service of Messrs. Siemens at Charlton as foreman of the cable department, subsequently joining the c.s. *Faraday* as assistant engineer for the laying of the first section of the Direct U.S. cable. After other experiences and a return to Sweden he entered the service of Col. R. E. Crompton at Chelmsford, working among other things on the first type of Crompton arc lamp, and he recognised the value of the Colonel's friendship. At the end of three years at Chelmsford Mr. Lundberg, in 1881, started a workshop in Clerkenwell, where a new type of lampholder was made, and subsequently there was developed the large and well-known business of A. P. Lundberg & Sons, which has long made a speciality of the production of switches and all other classes of electrical accessories for lighting, heating, and power. Large numbers of readers are aware of the late gentleman's efforts to assist others to gain electrical knowledge in matters where he himself had experienced difficulty. It will be remembered that with this end in view, he secured the hearty co-operation of the late Mr. W. Perren Maycock and a successful scheme of examination in switching and kindred matters was prepared, which proved very successful and ran continuously for over 10 years. Although withdrawn over two years ago, we understand that several applications for test papers still arrive weekly. Messrs. Lundberg feel that the scheme did something to raise electrical installation matters to a higher level. The snowball effect was so great that inquirers took the scheme as a correspondence course.

Wills.—The late Sir E. E. Pearson, a director of S. Pearson & Sons, contractors, left, so far as can be at present ascertained, £124,525 net and £247,917 gross personalty.

The late Sir Alfred Shuttleworth (Clayton & Shuttleworth, Ltd., Lincoln) left £1,020,808.

Mr. R. T. Brown, late of the West India & Panama Telegraph Co., Ltd., left £11,343 gross and £9,131 net personalty.

New Companies Registered.

Faraday Sound Wave Electric Gramophone, Ltd. (211,922).—Private company. Registered February 22nd. Capital, £100 in 1s. shares. Objects:—To carry on the business of manufacturers of gramophone or other motors, gramophones or their parts, wires, apparatus, electrical appliances, mechanical devices for use in connection with musical instruments, loud-speakers, &c. The first directors are:—A. M. Kinnear, 65, Dalmeny Avenue, S.W.16; A. F. Chappell, 39, Baalbec Road, N.5. Secretary: T. Granville Smith. Registered office: 8, Bridewell Place, E.C.4.

Dodds Flame-Spark Co., Ltd. (14,014).—Private company. Registered in Edinburgh on February 19th. Capital, £2,000 in £1 shares. Objects:—To manufacture and deal in an electrical device to be known as "The Dodds Flame-Spark," used for facilitating the starting of petrol-driven engines, and to acquire the patent rights of the said device, &c. The directors are:—H. J. Gray, 41½, Union Street, Aberdeen, M.A., J.P., advocate; E. M. Dodds, 146, Bon-Accord Street, Aberdeen, university assistant; J. M. Strachan, Culver Lodge, Acton Vale, London, W.3, coachbuilder and engineer. Qualification, 100 shares. Registered office: Crown Mansions, 41½, Union Street, Aberdeen.

Trelleborg Ebonite Works, Ltd. (211,931).—Private company. Registered February 22nd. Capital. £5,000 in £1 shares. Objects: To carry on the business of manufacturers, importers and exporters of ebonite, vulcanite, rubber tires and goods made wholly or partly of rubber, to act as merchants, commission agents, carriers, shipowners, &c., in the United Kingdom, Scandinavia, and elsewhere, &c. The subscribers (each with one share) are:—H. Reynolds, 7, Arundel Street, W.C.2, solicitor; E. T. Gorst, 7, Arundel Street, W.C.2, solicitor. The first directors are to be appointed by the subscribers. Remuneration as fixed by the company. Solicitors: Reynolds & Sons, 7, Arundel Street, W.C.2.

Herculean, Ltd. (211,960).—Private company. Registered February 24th. Capital, £12,000 in £1 shares. Objects: To carry on the business of synthetic products manufacturers, manufacturers of electrical insulating moulding powders, laminated cloth and paper, insulating cables, tapes and products of all kinds, manufacturers of synthetic resin, &c. The permanent directors are:—W. A. Jones (managing director), Clifton Street, Miles Platting, Manchester, electrical engineer; and F. L. Jackson, Clifton Street, Miles Platting, Manchester, secretary. Qualification, 500 shares. Remuneration as fixed by the company. Solicitors: H. T. Sales, 44, Kennedy Street, Manchester.

Ellerphones, Ltd. (211,956).—Private company. Registered February 24th. Capital, £5,000 in £1 shares. Objects: To carry on the business of radio engineers and manufacturers of, and dealers in radio apparatus and gramophones, &c. The first directors are:—R. H. Elleray, "Spring Bank," Lyth, Kendal, mechanical and electrical engineer; J. G. A. Kitchen, "Brookfield," Windermere, gent.; and J. K. Thornborough, "Rosemount," Westbourn Terrace, Windermere, electrical engineer. Qualification, 300 shares. Solicitor: W. Todd, 18, Sunt Street, Lancaster.

Julians of Reading, Ltd. (211,993).—Private company. Registered February 25th. Capital, £5,000 in £1 shares. Objects: To carry on the business of electrical engineers, manufacturers of and dealers in motors, motor cars, motor and other cycles, aircraft, radio apparatus and accessories and parts thereof, &c. The first directors are:—H Julian, The Hermitage, Basingstoke, motor engineer; A. A. S. Julian, 46, St. Anne's Road, Caversham, motor engineer; and W. H. Julian, The Hermitage, Basingstoke, motor engineer. Qualification, £100. Remuneration of chairman, £500 per annum; of A. A. S. Julian and W. H. Julian, £350 per annum. Secretary: A. J. Stevens, 96, Basingstoke Road, Reading. Solicitors: Blandy and Blandy, 1, Friar Street, Reading. Registered office: 84, Broad Street, Reading.

Official Returns of Electrical Companies.

Adelaide Electric Supply Co., Ltd.—Acknowledgment of indebtedness dated February 8th, 1926 (supplemental to trust deed dated June 11th, 1918, and deeds supplemental thereto), to secure £250,000 redeemable consolidated debenture stock, making in all £1,000,000 debenture stock secured by the original trust deed, constituting a floating charge on the company's undertaking in Australia (excluding dividend equalisation fund and uncalled capital). Trustees: Electric and General Investment Co., Ltd., Falcon House, Aldersgate Street, E.C.1.

Electron Co., Ltd.—Issue on February 2nd, 1926, of £1,400 debentures, part of a series already registered.

Ayling & Co., Ltd.—C. Currie, of 29g, Ixworth Road, Lewis Estate, Chelsea, S.W., was appointed receiver and manager on February 12th, 1926, under powers contained in debenture dated October 23rd, 1925.

Practical Machines Co. (A. T. Gadsby), Ltd.—R. W. Simmons, of 23, College Hill, Cannon Street, E.C., was appointed receiver and manager on February 13th, 1926, under powers contained in debentures dated April 9th, 1923.

John Richards & Co. (Electrical Engineers), Ltd. (183,000).—Capital, £6,000 in £1 shares. Return dated January 1st, 1920. 4,802 shares taken up. £2 paid. £4,800 considered as paid. Mortgages and charges, nil.

Luminograph Co., Ltd. (185,849).—Capital, £1,000 in £1 shares. Return dated January 14th, 1926. All shares taken up. £1,000 considered as paid. Mortgages and charges, £1,500.

Credenda Conduits Co., Ltd. (126,340).—Capital, £50,000 in £1 shares. Return dated January 14th, 1926. All shares taken up. £30,000 paid. £20,000 considered as paid. Mortgages and charges, nil.

Barbados Electric Supply Corporation, Ltd. (104,367).—Capital, £60,000 in 40,000 preferred and participating and 20,000 ordinary shares of £1 each. Return dated December 16th, 1925. 35,172 preferred and 20,000 ordinary shares taken up. £34,672 paid. £20,500 considered as paid. Mortgages and charges, £19,000.

British Automatic Telephone Installation Co., Ltd. (176,608).—Capital, £10,000 in £1 shares. Return dated December 22nd, 1925. 4,500 shares taken up. £4,418 15s. paid (being £1 per share on 4,175 and 15s. per share on 325 shares). Mortgages and charges at date of return, nil. Since registered: Debenture dated January 27th, 1926, to secure £300.

Metalite Co., Ltd. (184,750).—Capital, £100 in £1 shares. Return dated November 5th, 1925. All shares taken up. £100 paid. Mortgages and charges, nil.

Robert W. Blackwell & Co., Ltd. (63,446).—Capital, £50,000 in £1 shares. Return dated January 14th, 1926. All shares taken up. £18,338 paid. £31,662 considered as paid. Mortgages and charges, nil.

Radio Equipment Co., Ltd.—Debenture dated February 10th, 1926, to secure £979 14s. 6d., charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Lighting, Heating and Glass, Ltd., Bilbao House, New Broad Street, E.C.

Rose Bros. Electrical Co., Ltd.—Satisfaction in full on January 29th, 1926, of debenture dated July 16th, 1925, securing £1,000.

Ingleby & Co., Ltd.—R. E. Starkie, of 6, South Parade, Leeds, ceased to act as receiver or manager on February 12th, 1926.

Lydbrook Cables, Ltd.—Debenture dated February 15th, 1926, to secure £37,500, constituting a specific charge on the company's land at English Broknor, Glos., and all other freehold and leasehold property of the company and a floating charge on the company's undertaking and other property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C

Brecknell, Munro & Rogers, Ltd. (79,766).—Capital, £150,000 in 2,200 preference shares of £5 each and 278,000 ordinary shares of 10s. each. Return dated January 28th, 1926. 2,058 preference and 174,829 ordinary shares taken up. £90,673 10s. paid on 2,058 preference and 160,767 ordinary shares. £7,031 considered as paid on 14,062 ordinary shares. Mortgages and charges, nil.

Greenwich Cable Works, Ltd. (74,517). — Capital, £125,000 in 50 000 preference shares of £1 each and 150,000 ordinary shares of 10s. each. Return dated April 1st, 1925 (filed February 3rd, 1926). 14,100 preference and 138,260 ordinary shares taken up. £30,480 paid on 11,350 preference and 38,260 ordinary shares. £52,750 considered as paid on 2,750 preference and 100,000 ordinary shares. Mortgages and charges, £30,000.

Almondsbury and District Electric Supply Co., Ltd. (183,582) —Capital, £3,000 in 1,000 preference and 2,000 ordinary shares of £1 each. Return dated December 10th, 1925. 1,000 preference and 1,115 ordinary shares taken up. £2,115 paid. Mortgages and charges, nil.

Rhayader Electric Light and Power Co., Ltd. (188,604).—Capital, £2,000 in £1 shares.—Return dated January 28th, 1926. 354 shares taken up. £1,770 paid. Mortgages and charges, nil.

Brookhirst Switchgear, Ltd. (175,995).—Capital, £550,000 in £1 shares. Return dated December 29th, 1925. 126,002 shares taken up. £30,502 paid. £95,500 considered as paid. Mortgages and charges, £25,000.

Corwen Electric Light Co., Ltd. (183,842).—Capital, £2,000 in £1 shares. Return dated November 10th, 1925. 1,245 shares taken up. £1,242 10s. paid. £2 10s. in arrears. Mortgages and charges, nil.

W. S. Laycock, Ltd. (in liquidation).—Satisfaction in full (1) on August 28th, 1925, of charge dated May 5th, 1925, securing £106,153 19s. 2d., and (2) on January 26th, 1926, of charge dated August 4th, 1920, securing £23,543 5s. 8d. and £3,171 7s. 7d., together with interest and any other amount or balance owing on current account or any other account. (Filed February 10th, 1920.)

Santon, Ltd. (172,731).—Capital, £4,000 in £1 shares. Return dated November 20th, 1925. 2,000 shares taken up. £2 paid. £1,998 considered as paid. Mortgages and charges, nil.

Electrolines, Ltd.—Debenture dated February 5th, 1926, to secure £450, charged on the company's property, present and future, including uncalled capital. Holder: E. Lewis, "Sonoma," Abbotsleigh, near Bristol.

Mann, Egerton & Co., Ltd.—Satisfaction in full (1) on June 6th, 1913, of mortgage dated April 1st, 1909, securing £2,000; and (2) on June 30th, 1925, of debenture ssecured by trust deed dated April 1st, 1905, securing £10,000.

London Electric Stores, Ltd. (185,651).—Capital, £1,000 in £1 shares. Return dated February 11th (filed November 28th), 1925. 750 shares taken up. £750 considered as paid. Mortgages and charges, nil.

Buss, Webb & Son, Ltd.—Satisfaction in full on December 30th of mortgage dated September 30th, 1925, securing all moneys due or to become due not exceeding £2,500.

Bullers, Ltd. (62,020).—Capital, £400,000 in 20,000 ordinary and 20,000 preference shares of £10 each. Return dated December 23rd, 1925. 15,593 ordinary and 15,000 preference shares taken up. £150,070 paid on 7 ordinary and 15,000 preference shares. £155,860 considered as paid on 15,586 ordinary shares. Mortgages and charges, £223,950.

Power and Traction Finance Co., Ltd. (181,220).—Capital, £250,000 in £1 shares. Return dated January 1st, 1926. 6,002 shares taken up. £6,002 paid. Mortgages and charges, nil.

Hall Telephone Accessories, Ltd. (175,783).—Capital, £30,000 in £1 shares. Return dated December 31st, 1925. All shares taken up. £6,501 paid (being £1 per share on 2 and 10s. per share on 12,998 shares). £17,000 considered as paid on 17,000 shares. Mortgages and charges, nil.

Wardle Engineering Co., Ltd. (102,714).—Capital, £25,000 in 10,000 preference and 15,000 ordinary shares of £1 each. Return dated January 13th, 1926. 4,432 preference and 7,139 ordinary shares taken up. £10,871 paid £200 considered as paid. £500 in arrears. Mortgages and charges, £4,000.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

The "Underground" Group.

Speaking at the joint annual meeting of the companies of this group, on February 25th, Lord Ashfield, the chairman, said that although the companies carried no less than 42 per cent. of London's vast traffic, they were unable to secure an adequate margin of income to meet the needs of the capital invested; and other traffic concerns were also in an unsatisfactory condition. He was convinced, however, as the traffic grew in volume, that, given a reasonable measure of co-ordination between the various interests concerned, there could be no question but that, at the existing level of fares, there was sufficient traffic already in existence to support all the facilities which London needed and leave a margin for further developments. They had been unable to work their traffic as efficiently as they desired; in the past four years the car-mileage had increased by 45 per cent., while the number of passengers rose by 41 per cent. The route mileage of the railways had been increased and trains were worked at more frequent intervals. They had been compelled by competition to increase the number of omnibuses until there were enough for a far bigger volume of traffic. To re-establish their financial position they needed a large increase in the number of passengers carried by the railways. All kinds of improvements had been and were being carried out; these had naturally led to some interruptions in the services which, however, would soon be done away with. They had arranged with the Southern Railway for the use of two disused tracks running to Turnham Green; that would enable them to secure a four-track system from Barons Court to beyond Acton Town at a moderate cost, and would permit the projection of the Piccadilly section trains to places west of Hammersmith. A Bill was being promoted to authorise the work. There was a demand for further facilities north and north-east of Finsbury Park. The extension of the Piccadilly section to these districts would involve an expenditure of £4,000,000. Until they were sure of securing an adequate return upon the very large sums already invested, they could not consider such a venture. Referring again to traffic conditions in London, Lord Ashfield said that a pooling scheme, such as they had in operation, was essential, and expressed the companies' willingness to enter into negotiations with other traffic concerns. There were certain favourable omens to be observed; he instanced the growth of traffic on the City and South London Railway and the Edgware extension, the work on which was being fully justified. He considered that the payment of rates by the railways which had no share in the services provided by municipal authorities was anomalous, and that that state of affairs should be corrected. Lord Ashfield then dealt with the past year's accounts, which were reviewed in our last issue, and concluded by saying that the current year showed improvement, and he hoped next year to present an encouraging account of the year's working. The reports and accounts were adopted, and at subsequent meetings of the railway companies the Bill mentioned by Lord Ashfield was approved.

London Electric Supply Corporation, Ltd.

The annual meeting was held on February 26th, Mr. R. H. Benson presiding. In presenting the report and accounts (*vide* our last issue, p. 347), the chairman said that in spite of the reductions which had been made in the charges, the gross revenue had increased by 15.62 per cent. The cost of production had been reduced from 0.97d. to 0.73d. per kWh, and the sales of energy had increased by more than 47 per cent. to 90,905,284 kWh. The demands for energy for all purposes were considerable and were continuing during the current year. The first section of the electrified portion of the South-Eastern and Chatham system had been put into service, and during 1926 the demand on the company's station would be materially increased by the inauguration of further electric services. The extensions at the Deptford station were almost finished, and the capital expended upon them would soon become productive. Referring to the electricity supply reorganisation scheme, the chairman said that it was regretted that the control of the Deptford station was passing out of their hands into those of the London Power Co., Ltd., but the change was essential to the unification of control of supply. He hoped that the Government's electricity measure would put forward a broad and impartial scheme, but he believed that, given the necessary Parliamentary powers, private enterprise was fully able to do all that was necessary to enlarge the use and to lower the cost of electricity in all parts of the Kingdom. The report and accounts were adopted.

Lancashire United Tramways, Ltd.

The report for 1925 shows total receipts of £285,046 and a gross profit of £66,143. The receipts and expenditure both showed increases due to the development of the motor-'bus services, but there was a favourable balance of £4,196. The interest on the prior lien debenture stock is paid, £15,000 is allocated to motor vehicle depreciation, 5 per cent. is paid on the second mortgage debenture stock, and £680 is carried to depreciation account. The depreciation and renewal accounts and the balances carried forward of the combined companies now amount to £218,942.

The annual meeting was held on February 24th. Sir Arthur Stanley, G.B.E., presided, and in the course of his speech, he said that an agreement had been made with the Farnworth Urban Council for an extension of the company's lease for a further 21 years. An understanding had also been reached with the Salford Corporation which would enable the company to run cars over the Salford system right into Manchester. The profit from the sale of electricity (£8,836) was a record; the generating costs had already been reduced by the working of the extensions at the power station. It was proposed to make further additions to the company's omnibus fleet during the current year. The directors intended to re-issue the prior lien debenture stock when it became due for redemption on July 1st, if necessary at a higher rate of interest. The report and accounts were adopted.

North Metropolitan Electric Power Supply Co.

Sir James Devonshire, K.B.E. (chairman and managing director) presided at the annual meeting on February 23rd, and in presenting the report and accounts (*vide* our last issue, p. 346), said that the past year had been one of activity, and the financial results had been satisfactory. The capital expenditure had amounted to £345,000, of which £210,000 was expended on mains and services. At the end of the past year the company had laid over 770 miles of trunk and distributing mains and had 174 sub-stations in service. After referring to the expansion of the supply, the chairman said that the diversity of the demand made upon the company was a factor of safety against depression in any particular trade. To meet undischarged capital commitments the directors had arranged for the sale of 300,020 6 per cent. cumulative preference shares of £1 each ranking *pari passu* with the existing 6 per cent. preference shares. The ordinary shareholders had taken up at a pre-

mium of 5s. per share 199,980 ordinary shares of £1 each. The new station at Brimsdown would consist, in the first instance, of two 20,000-kW turbo-generators with steam-raising equipment of the most modern type; the Electricity Commissioners had expressed their approval of the proposals. The company's area of supply was increased to 632 sq. miles by the Act passed last year, and already mains had been laid to Stevenage and Knebworth in the added area, and it was expected that mains to Royston and Hitchin would be installed during the current year. The average revenue per kWh sold had fallen from 1.60d. in 1924 to 1.52d. in 1925. The chairman said that the company could claim to have anticipated the Government's proposals relating to the pooling of power resources. It had interchanged supplies with adjoining undertakings for many years past.

Westminster Electric Supply Corporation, Ltd. This company's report was reviewed in our issue of February 19th (p. 306). The annual meeting was held on February 24th under the chairmanship of Lord Wargrave, who, during the course of his speech, said that they had been able to maintain the dividend and to add over £80,000 to general reserve and depreciation fund, bringing that fund up to £630,000. While the output had been increased by nearly four million kWh, the total costs had remained stationary. Already during the current year they had increased their output by over a million kWh. The chairman then dealt in some detail with the reorganisation scheme, and stated that they had submitted a schedule of existing assets, and a computation of the standard prices, which were to govern any excess dividend over and above the standard dividend authorised by the Act, to the London County Council, acting on behalf of the Joint Electricity Authority, for approval. Lord Wargrave said that the extension of tenure would enable them to show—what he contended they had shown up to date—that electricity under private enterprise could be supplied to the public at as favourable, if not more favourable, a rate as could be done under municipal enterprise. He deprecated the cry of "cheap and abundant electricity" which ignored the cost of generating plant and distribution mains, and said, in conclusion, that he hoped the Government would not set up another body of persons to supervise the industry, as that would only clog the wheels and prevent that freedom which was essential for the proper development of the industry.

Mather and Platt, Ltd. The net profit for the past year was £260,885, as compared with £275,034 in 1924 and £325,291 in 1923. The dividend, however, remains the same, 10 per cent., plus a bonus of 5 per cent., both free of tax. £40,910 is transferred to the income tax equalisation fund, and £178,281 is carried forward. The meeting was held in Manchester on Friday last. Mr. L. E. Mather, who presided, said that the result of the past year's working was satisfactory in view of the continued depression of trade. The increase in the item "Sundry debtors," was due to their having had to accept deferred payments for goods supplied, particularly to Russia and Central Europe. This policy had been followed for many years prior to the war with uniformly satisfactory results. Their workshops continued to be run smoothly and efficiently and would bear comparison with the best factories in the United States and on the Continent. During the year the home business had maintained its volume. The falling off of the demand for electrical plant and pumps for collieries had been balanced by the expansion of municipal undertakings. As one of the pioneers of the electrical industry in this country, the company welcomed the Government's electricity proposals. Foreign trade had improved on the whole, and he was glad to report that relations had been re-established with Russia which had placed important orders.

Yorkshire (West Riding) Electric Tramways Co., Ltd. Sir Herbert S. Leon, Bart. (chairman), presided at the annual meeting on February 26th, and in moving the adoption of the report and accounts (*vide* our last issue, p. 347), said that the decrease in the revenue was attributable partly to the state of trade in the district but more particularly to omnibus competition. For some years the company had operated under an "Increase of Charges" order, but for some inexplicable reason the Ministry of Transport had made them reduce certain fares in August last, resulting in a loss of at least £7,000. The abandonment of the Normanton, Castleford and Pontefract sections had been enforced by unrestricted omnibus competition. Although the company had given unfailing and satisfactory service in the district for nearly 20 years, its appeal to the authorities for protection had met with no response. The time was fast approaching, however, when traffic services must be strictly licensed and controlled; the company would then reap the reward of its enterprise. Already the West Riding County Council was taking up the matter.

London United Tramways, Ltd. The report for the past year records traffic receipts of £374,284 and an expenditure of £360,551, leaving net receipts of £13,733, to which was added £7,498 miscellaneous receipts, making £21,231. The deduction of interest and payments to local authorities caused a deficiency of £29,149 and this, together with the previous year's deficit (£16,356), has been carried forward. The report also complains of the growing competition of omnibuses, and states that the company will be unable to carry out its statutory obligations if conditions are not mitigated. At the close of the year the amount of £400,000 allotted for reconstruction had been exceeded. The removal of the tramway from Richmond Bridge to London Road, Twickenham, has been completed, and costs in connection with it have been written off. The meeting was called for Wednesday last.

German Companies. The *Sudicatis Telephone Works and Screw Industry Company*, which is owned entirely by the Berliner Telephone Company, reports that the chief departments were satisfactorily employed during 1924-25, and this state of affairs is continuing in the new financial year. The net profits of 14,000 marks for the past year have been carried forward.

The report of the *Telephone Works Company (late Berliner)* of Berlin and Hanover states that activity in 1924-25 prevailed in almost all departments, while the conditions were normal in the case of the branches and subsidiary companies. A reduction only took place in the orders received from the postal authorities for apparatus, but this was compensated for by orders for automatic equipment for the Reich telephone network. The gross profits are given as 310,000 marks and the net profits, which have been carried forward, as 265,000 marks.

Torquay Tramways Co., Ltd.—Mr. H. T. Barnett (chairman) presided at the annual meeting on February 24th, and in reviewing the past year's working said that in the circumstances the results must be considered satisfactory although the traffic revenue had fallen considerably. That decrease of revenue was due to the competition of motor 'buses on the Torquay-Paignton road. In the winter months the services of trams and 'buses were excessive, and were run at a loss. In addition, the company was burdened with the cost of track maintenance and rates, apart from the handicaps of workmen's fares and compulsory stopping places. The chairman condemned the interference of small competitors in the business of public transport. In conclusion, he said that the Devon General Omnibus and Touring Co., whose ordinary capital was held by the company, was proving a valuable asset.

Radio Corporation of America.—According to the *Financial Times*, the net earnings of this corporation during 1925 amounted to only $5,737,206, as compared with $9,503,442 in the preceding year. After providing $700,000 for Federal taxes, $960,145 to reserve amortisation for patents, $524,068 to other reserves and writing off $700,000, there remained a surplus of $2,852,993, equivalent after preferred dividend payments, to $1.27 per share earned on 1,155,400 common shares of no par value, as against $2.90 per share in 1924. For the first nine months of the year earnings applicable to the common shares were only $140,540, or 12 cents a share, so that the company made a marked recovery in the final quarter to bring up the earnings as it did. No dividend is declared on the common shares.

Metropolitan Electric Tramways, Ltd.—There was a further fall in the receipts during the past year, the total being £668,756. The expenditure was £659,586, leaving a balance of £9,170. To this were added £110,000 miscellaneous receipts and £3,396 brought forward, making £122,566. After deducting interest, rentals, and other fixed charges, there was a debit balance of £43,846, which has been carried forward. The decreased receipts are attributed to the growing competition of motor omnibuses, and it is stated that unless relief is promptly secured the company will be unable to fulfil its statutory obligations. The meeting was to be held on Wednesday last.

Liverpool Overhead Railway Co.—The report for the year ended December 31st last states that the gross revenue receipts were £126,134, and the working expenses (including £5,400 transferred to reserves, were £120,687, leaving a surplus of £5,446. The deduction of the debenture interest causes a deficit of £1,309. This is met by the amount of £5,68 brought forward, the balance (£4,380) being carried to the next account. The number of passengers of all classes carried fell from 11,478,735 to 11,418,978. The report mentions the death of Mr. J. U. Hodgson, a director, and the appointment of Col. H. Concanon, O.B.E., to the vacancy thus caused. The meeting was to be held yesterday (Thursday).

Quebec Power Co.—The earnings during 1925 amounted to $1,046,943, an increase of $138,473, and the operating expenses to $236,444. Interest absorbed $300,000, depreciation $60,000, preferred dividends $207,665, and common dividends $198,607. The surplus was $44,225, making the total a credit of profit and loss $80,232. The assets are valued at $13,175,416, as compared with $11,710,331 a year earlier.

Dividends of $1¼ per share on the common shares, and of $1¾ per share on the cumulative preferred shares have been declared in respect of the quarter ending March 31st.

Hendon Electric Supply Co., Ltd.—After meeting debenture interest, preference and interim ordinary dividends, &c., a balance of £32,591 remains from the receipts from the past year's working. It is proposed to place £8 300 to the repair and renewals fund, to write off duty on the increase of capital and the cost of issue (£1,012), and to pay a final dividend of 2s. per share, free of tax, on the ordinary shares. After additional remuneration to directors is deducted, a balance of £1,853 is carried forward. The meeting is to be held to-day (Friday).

New Issues.—According to *The Times*, the business of *Messrs. J. Hopkinson & Co., Ltd.*, of Huddersfield, is to be converted into a public company, with a capital of £700,000, and £350,000 7 per cent. cum. preference shares are to be offered at par early next week.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.—The directors are publicly inviting applications for £400,000 five per cent. first mortgage debentures to bearer repayable at £100 per debenture on March 25th, 1936, in debentures of £100 each at £93 per debenture. The money is required solely for the repayment of existing debentures for the same amount falling due March 25th this year. Each holder of existing debenture who exercises his preferential rights will be entitled to receive in exchange for each existing £100 debenture a new £100 debenture and a payment of £7 in cash.

London and Suburban Traction Co., Ltd.—The total receipts during 1925 fell by £1,819 to £47,551, and the expenditure amounted to £43,189, leaving a balance of £4,362. This, together with the balance brought forward (£12,704), is carried forward. The report refers to the detrimental effect of motor-'bus competition, and states that, although a certain measure of protection was granted, it came too late to be of much advantage. The meeting was to be held on Wednesday.

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be officially quoted :—

Yorkshire Electric Power Co.—500,000 ordinary shares of £1 each, fully-paid, Nos. 1,103,001 to 1,603,000.

Dealings in the following have been specially allowed by the Committee under Rule 159 :—

North Metropolitan Electric Power Supply Co.—300,020 new 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 599,981 to 900,000.

Telegraph Construction and Maintenance Co., Ltd.—The report for 1925 shows a net profit of £110,631, to which was added £114,861 brought forward, making £225,492. It was proposed to pay a final dividend of 7½ per cent., free of tax, making 10 per cent. for the year, to transfer £30,000 to the supplement reserve fund (making £300,000), and to carry forward £105,852. The meeting was to be held yesterday (Thursday).

South Metropolitan Electric Tramways and Lighting Co., Ltd.—The company's accounts for 1925 show a balance on working of £60,626 and a net income of £48,248, to which is added £5,809 brought forward, making £54,057. After deducting interest, &c., and making provision for renewals (£15,000), a dividend of 5 per cent. is paid on the ordinary shares and £10,244 is carried forward. The meeting was to be held on Wednesday last.

Electro Bleach and By-Products, Ltd.—The balance from working for the past year, after providing for depreciation, repairs, employés' bonus, &c., was £39,202, to which is added £1,781 brought forward, making £40,983. After meeting the preference dividend, a final dividend of 13 per cent., making 20 per cent. for the year, is paid on the ordinary shares, and £983 is carried forward. Meeting : March 9th.

Uxbridge and District Electric Supply Co., Ltd.—The report for the past year shows a profit of £39,745, to which is added £1,589 brought forward, making £41,334. A dividend of 8 per cent. is paid (as in 1924), £15,000 is allotted to depreciation, £1,200 to debenture stock redemption fund, and £1,385 is carried forward.

Kensington and Knightsbridge Electric Lighting Co., Ltd.—The directors recommend a balance dividend of 10s. per share, less tax, on the ordinary shares for the half-year ended December 31st, 1925, making 15 per cent. for the year.

Dubilier Condenser Co. (1925), Ltd.—The first accounts of this company are to be closed on March 31st, and the first annual meeting will be held as soon after this date as possible.

Clyde Valley Electrical Power Co.—A final dividend of 5 per cent. has been declared on the ordinary shares, making 8 per cent. for the year, as in 1924.

Metropolitan Electric Supply Co., Ltd.—A final dividend at the rate of 16 per cent. is recommended, making 11 per cent. for the year, as in 1924.

Stocks and Shares.

Monday Evening.

The financial air is lively with talk of a possible reduction in the Bank Rate on Thursday in this week. Monetary considerations flatter the possibility, and the Government's evident desire to do everything possible towards the fostering of trade and industry may serve as an additional lever, if one were wanted, to induce the Bank Court to lower the 5 per cent. minimum set up on December 3rd last year. Money in plenty is available for investment.

The recent issue of London Power 5 per cent. debenture stock at 96 was largely over-subscribed. Those who had the right to preferential treatment in the allotment, that is, the share and debenture holders of the constituent companies, received about 45 per cent. of their applications, while the general public got only 15 per cent. The price of the stock started, oddly enough, at a small discount, which suggested that the stag had noted the security as being sound, but there was very soon sufficient demand for the price to be lifted to ¼ premium. The Southern Railway has opened fresh electrical extensions this week, and it is thought that these are likely to involve further issues of capital. Heartily maligned as it is, the Southern Railway is certainly doing well for its shareholders; its stocks, alone in the list of the grouped railways, show rises in to-day's prices as compared with those of three years ago, when the grouping system came into force.

The Isle of Thanet Electric Supply enters the dividend list with a modest 2½ per cent. for last year. Nothing was paid in the previous twelvemonth. The price is a shade better at 17s.

The London Electric Supply Corporation, it was announced at the meeting the other day, will provide the Southern Railway with current in the present year, and at a rate considerably greater than that of a year ago. As soon as the company's Deptford power station is finished, however, it will pass over to the London Power Company under the arrangement recently announced. The price of the shares has strengthened to 32s. 6d. The Kensington Company has declared the same dividend as before on its ordinary, namely, 15 per cent. for last year, and the yield at the present price of the shares is 5¼ per cent. Richmond (Surrey)—shares in which were recently distributed to Bournemouth & Poole proprietors—declares the same dividend as before, namely, 10 per cent. less tax, while the Bournemouth dividend is to be 10 per cent., together with 4 per cent. bonus, the latter tax free. These results are the same as those for 1924. The South Metropolitan Electric again pays 15 per cent. for the year. Price changes in prices on the week are insignificant. Bournemouth and Poole went back to 62s.; St. James's lost ½ which they gained a week ago, the price now being 16½. Changes in the prices of the preference shares are few and insignificant.

Hendon Electric Supply has declared a final dividend of 2s. tax free, and the shares keep firm at 53s. The Clyde Valley's 5 per cent., final, makes 8 per cent. for the year, as before, and the shares remain at 30s.

The Home Railway market is quiet again. Lord Ashfield was complaining last week, at the meeting of the Underground Companies, of the way in which independent 'buses had increased, as compared with the reduction in the London General omnibuses under the Traffic Act. He pleaded for a wide scheme in regard to London traffic, a scheme that should embrace both a common financial enterprise and a common management. Within the past few days, developments have occurred which should have the effect of reducing the number of 'buses and of encouraging traffic on the trams. London United Tramways debenture at 48 is 3 higher. The company's report shows a deficiency of £29,000, which has been added to the £16,000 deficit of the previous year and carried forward. London & Suburban Traction preference are 6d. better at 5s. 6d. The Metropolitan Electric Tramways showed a deficiency of £43,800 for last year, and this amount will be carried forward into the current year. The London & Suburban Traction has £17,000 to go forward on the right side, but is paying, of course, no dividends. Underground Incomes, quoted 3 per cent. ex dividend on Monday in this week, are unchanged, allowing for the deductions. There is no premium, this time, on the coupons.

Cable equipment shares are steady, with Babcocks holding their price at 53s. 9d. The prospect of an engineers' strike, coupled with the possibility of other labour disturbances in the near future, are having a deterrent effect upon business in markets concerned with iron, steel and similar shares. Nor is it expected that other companies could avoid being damaged, to some extent, if there were to be any serious stoppage of work. General Electrics are a little better at 32s., Metropolitan-Vickers preference improved to 2 7/16. Cromptons are on the dull side at 16s. 3d. The Telegraph Construction Company has made a net profit of £110,600, which is about £700 less than that for 1924; the company pays the usual 10 per cent. tax free dividend for the year, and the price of the shares maintains its recent advance, at 29. Were the shares to be divided from their present cumbersome denomination of £12, into new shares of £1 each, a freer market would be assured.

Marconi Marines have risen to £1, and are the firmest member of the wireless division. New York has been selling Radio common, the price of which is lower at 7¾, though the preferred keep steady at 9⅜. Cable stocks and shares exhibit no striking movement. Globe preference lost ⅛, going back to 10⅞. Chile Telephones are slightly harder. The Direct West India Cable Company's dividend is again 5s. tax free, this being the interim distribution.

The excitement in Brazilian Tractions has partially subsided, and the price of the shares drooped to 97. Stock Exchange brokers have many selling limits at 100, and until these orders are cleared out of the way, the price of the shares may cling closely under par. Montreal Light, Heat & Power lost a point or so at 226½. British Columbia Electrics are dull. Anglo-Argentine Tramway second preference, officially quoted at 3 middle, can be bought below that figure, shares having come to market of late. Proprietors are probably feeling disappointed with the company's traffic returns. Nothing fresh has happened in the Mexican Utility issues.

Rubber, the produce, fell to 2s. 1d. per lb., and rallied to 2s. 3d. Loud cheers greeted the recovery when the figures were posted in the Stock Exchange rubber market. Share values promptly improved, and the market took on a cheerfuller aspect than it has displayed of late. There is a considerable bear account in some of the principal shares.

Exterior Lighting Scheme.—An exterior lighting schem was employed for the illumination of St. Patrick's Cathedra Dundalk, on the occasion of the recent visit of the Mos Rev. Dr. O'Donnell. Over 300 20-W Osram lamps wer employed, 94 on the stone screen fronting the Cathedral, 10 on the building itself, and 102 on the belfry and clock towe The belfry interior was lighted by two 500-W lamps. Th scheme was designed by Mr. P. A. Spalding, A.M.I.C.E.

The Classification of Insulating Materials.—The atter tion of the British Electrical and Allied Industries Researc Association has been called to the possibility of confusio arising through the use in its reports of letters of the alphabe for the classification of certain insulating materials accordin to properties, uses, &c., because of the fact that the Britis Engineering Standards Association has adopted a classifica tion of insulating materials used in electrical machinery an apparatus by letters of the alphabet according to the workin temperatures for which they are suitable.

In consultation with the B.E.S.A., it has been decided th the B.E.A.I.R.A. shall in future use Roman numerals fo its classifications, and thus avoid any clashing with the class fications of the B.E.S.A. The following reports already issue are affected by this alteration:—Ref. A/S3, pressboard; Re A/S5, insulating papers; Ref. A/S10, non-ignitable board In all the above documents, where the classification is Cla A, Class B, Class C, &c., the designation in future will b Class I, Class II, Class III, &c.

Railway Electrification in France.

Some Particulars of a Section of the Orleans Railway.

By H. PARODI.

(Abstract of a Paper read before a joint meeting of the Institution of Electrical Engineers *and the* British Section of the Societe des Ingenieurs Civils.)

(Concluded from page 355.)

PART 2.

Of the railway lines from the Central Plateau to Paris, those which the Orléans Company proposes to electrify first are the ones having the greatest density of traffic and, consequently, the biggest consumption of coal. It can easily be shown that the greater the coal consumption per mile of line, the more favourable will be the financial results of electrification. For this reason and others the company, after having investigated with the Government the question of commencing the electrification by converting to electric traction the lines in the neighbourhood of the waterfalls of the Central Plateau, eventually decided to carry out the electrification in the following order (see fig. 1):—Paris to Brive, 312 miles, four track and double track; Brétigny to Dourdan, 17 miles of double track; Saint-Sulpice to Gannat, 118 miles of single track; Brive to Clermont, 123 miles of single track. These make a total of about 980 miles of main-line track, excluding switching tracks, sidings, and sorting and shunting stations. On these lines electric traction will replace steam traction for the whole of the passenger, goods, and shunting services.

The scheme has been drawn up with a view to making provision for the following traffic per year:—40 million tonne-km on the Paris-Orléans section, 20 million tonne-km on the Orléans-Vierzon section, and 12 million tonne-km on the Brétigny-Dourdan section, although, as a matter of fact, the traffic in 1923 only reached 22, 12, and 3½ million tonne-kilometres per kilometre respectively on these sections.

Fig. 3 shows the average yearly traffic on the Paris-Orléans section from 1895 to 1923, and clearly indicates the necessity

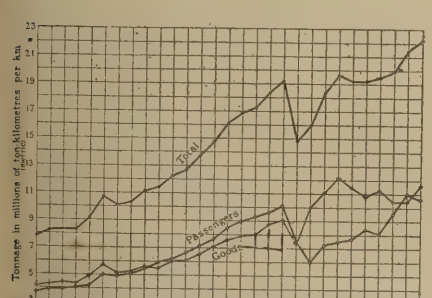

Fig. 3.—Paris-Orleans Traffic.

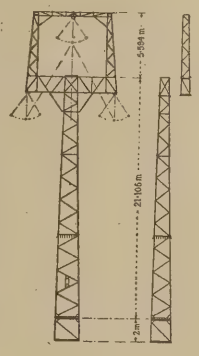

Fig. 4.—E.H.P. Transmission Tower.

of providing, as has been done, for increased requirements in the future, so as to avoid changing the plant materially during the next 15 years at least.

The orders for the Paris-Vierzon and Brétigny-Dourdan electrification, involving the equipment of over 600 km (370 miles) of main-line track, have all been placed since 1923. Already a number of electric trains are running from Paris (Quai d'Orsay) to Etampes and from Brétigny to Dourdan, a total length of 96 km (59½ miles) of route, and the electric service will be extended as far as Orléans and Vierzon before the end of 1926.

The electrical energy for the Paris-Vierzon section is generated in a system of three-phase power stations comprising, at present, the steam-power stations of the Paris district, the water-power plant of Eguzon on the River Creuse, and a group of water-power stations forming part of the concession granted by the State to the Orléans Company.

The unavoidable fluctuations in the output of the water-power stations will be completely compensated, in the case of the plants on the River Creuse, by the exchange of energy between the Eguzon water-power plant and the Gennevilliers steam plant; and in the case of the Haute-Dordogne plant by means of the Chavanon reservoir and by the exchange of energy with the Alpine hydro-electric stations. The energy generated in the various hydro-electric and steam-power stations will be transmitted as follows:—At 13.5 kV by three three-phase cables, at 60 kV by three groups of single-phase cables, at 90 kV by two three-phase overhead lines, at 150/220 kV through an overhead line connecting four transformer sub-stations, and at 120 kV through a line connecting the power stations of the Central Plateau to the Alpine stations.

Fig. 4 shows the general arrangement of the 90 kV and 150 kV towers.

The transmission lines at 60 kV, 90 kV, 120 kV and 150 kV, will be interconnected through five transformer sub-stations situated respectively at Chevilly, Chaingy, Eguzon, Vernéjoux and Commentry.

Three-phase energy at 50 periods is transformed to d.c. at 1,500 volts at 11 sub-stations, representing a total capacity of 54,000 kW for the sections, Paris to Vierzon (200 km, or 124 miles) and Brétigny to Dourdan (27 km, or about 17 miles). The plant consists of twenty-seven 2,000-kW sets of exactly similar type, each comprising two 1,000-kW, 750-volt rotary converters connected in series.

On the suburban section from Orsay to Brétigny a third rail, used also as a feeder, is provided in addition to the overhead line; the shape and method of support of this rail are shown in fig. 5. Beyond Brétigny the carrying capacity of the catenary line is increased by means of a copper feeder of 240 sq. mm. section.

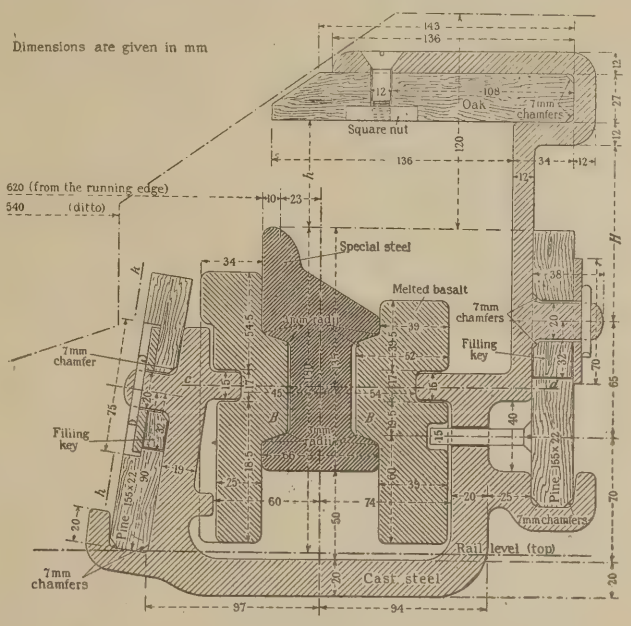

Fig. 5.—Contact Rail.

The suburban trains consist of motor coaches and trailers, whilst the main-line trains, both passenger and goods, are made up of the ordinary rolling stock hauled by electric locomotives.

Each motor-coach multiple-unit train consists of one, two or three driving units, each comprising an electric motor coach, weighing 65 tonnes, and two bogie-type trailers, each weighing 34 tonnes, the total weight of the train therefore being 133 tonnes. Each motor coach is fitted with two independent bogies, each carrying two 250-h.p., 750-V motors which are permanently connected in series. An order has been placed for 80 motor coaches, from which 25 multiple-unit trains of three units each will be formed for the suburban service. At present eight motor coaches are in service, some at 1,500 V and others temporarily at 600 V on the old electric traction system.

Goods and passenger trains, rated for speeds lower than 75 km per hour, are hauled by double locomotives comprising two units. Each unit, or half-locomotive, is supported on two bogies, and each bogie carries two 1,500-volt motors with forced ventilation. Each motor has, depending on the type, a one-hour rating of from 375 to 430 h.p. and a continuous rating of from 300 to 375 h.p.; the unit is designated by the symbol "BB+BB." Two hundred half-locomotives have been ordered, and more than 50 of these have been delivered and are under test or in operation on the electrified lines.

Trains with a nominal speed higher than 65 or 70 km per hour are hauled by special locomotives of slightly greater power than the double goods locomotives; these are of lighter construction and are specially designed for attaining high speeds.

Five experimental locomotives have been ordered, three of which have been delivered and are under test and adjustment. One is a gearless locomotive of the type "2C + C2," having a one-hour rating of 2,700 h.p. Two of the locomotives are of the type "2D2" with connecting-rod drive; these have a one-hour rating of 4,000 h.p. and a continuous rating of 3,500 h.p. One of these is fitted with "hyperstatic" connecting-rods and motors of the usual type, whilst the other has "isostatic" connecting-rods, flexible couplings, and fully-compensated motors. The other two locomotives are of the type "2D2" with outside gear-drive and small connecting-rods, and have a one-hour rating of 3,600 h.p. and a continuous rating of 3,000 h.p. One of these locomotives is provided with standard running gear and motors, and the other with adjustable articulated running gear and fully compensated motors arranged for regeneration.

Fig. 6 shows the curve of maximum sustained output for a locomotive of the Mikado type and the drawbar pull and motor characteristic curves for the BB 101-180 locomotives.

It will be seen that curve C, representing the tractive effort which can be sustained indefinitely without undue heating of the motors, passes very close to the point of intersection of the characteristic for the BB locomotive at full field and that of the Mikado locomotive. For speeds ranging from 50 to 70 km per hour the electric locomotive will thus be able to develop indefinitely a drawbar pull greater than that which can be obtained for a considerable period from a steam engine. By decreasing the gear ratio it would be possible to increase the power available at high speeds from the electric locomotive and to show a still greater superiority over the steam locomotive.

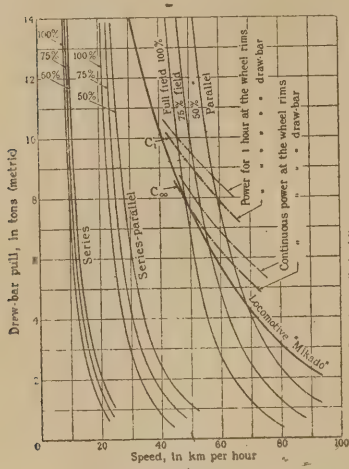

Fig. 6.—Mikado and BB 101-180 Curve.

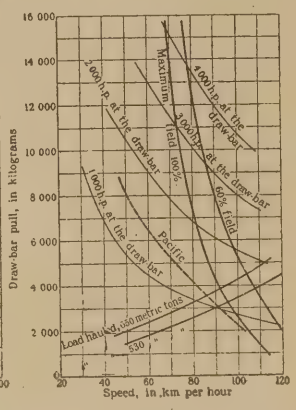

Fig. 7.—Electric and Steam Drawbar Pulls.

Fig. 7 shows the running characteristics of locomotives of the type 2D2 of 3,500 h.p. continuous output with maximum field (100 per cent.) and reduced field (60 per cent.).

In the same figure has been drawn, for comparison, the curve representing approximately the maximum tractive effort at the drawbar hook of the tender of a Pacific engine of the Orléans Company weighing (including its tender) approximately the same as the connecting-rod electric locomotives of the type 2D2.

The comparison of these characteristic curves shows that for all speeds from 90 to 110 km. per hour the useful power obtainable continuously at the drawbar hook of the electric locomotive is about 2.5 times greater than that obtainable at the drawbar hook of the tender of the steam engine.

Discussion in Birmingham.

Dr. C. C. Garrard said he approached the paper primarily from the point of view of how it reflected on the future of electric supply in this country. Referring to the passage in the paper, "the greater the coal consumption per mile of line, the more favourable will be the financial results of electrification," he assumed that the density of traffic and hence the coal consumption per mile on British railways were as great as, or greater than, anywhere in the world, hence Mr. Parodi's conclusion applied with increased force to British conditions. He hoped that the view of the French Government in regarding the substitution of electrical energy for steam on railways as one stage in a more comprehensive scheme would find favour in the discussions on the Electricity Bill about to be introduced into Parliament.

The load factor of the French electricity supply was given as 28 per cent., but it was shown how the addition of railway load would improve the load factor. As one of the chief hopes for cheaper supply under the British Government's proposals was based upon the securing of an improved load factor, this showed how important it was to include railways in the electrification scheme. The difficulty in his view was the conservatism of the railway directors, and the railway amalgamations had rendered the railway companies more powerful and less likely to make innovations.

If the Institution wished to help forward railway electrification in this country, it would have to enlist public opinion on its side. The public did not realise what a wretched transport service the British railways rendered, and he wished to emphasise that it was not possible to secure greater comfort and convenience for the travelling public unless electric traction was adopted.

The majority of the terminal stations in London and our large cities were a disgrace, but it was very difficult indeed to do anything with them with the steam system.

Mr. F. J. Moffett said Mr. Parodi's paper was very timely, as at the present time our principal railway companies were devoting attention to the question of electrification. As the Prime Minister pointed out in his speech at Birmingham on January 15th, one most important desideration for a cheap and abundant supply of electrical energy was a good load factor, and it was generally recognised by all electrical engineers that the readiest means of improving the load factor of our large generating stations was to provide an electric-railway load.

Electrical engineers were agreed that there were no insoluble technical problems to be overcome and that the chief obstacle appeared to be lack of capital. It would appear that it was just as feasible for the Government to provide loan facilities for this purpose as for the interconnecting trunk lines and standardisation of frequency provided for under the new State electricity scheme.

Major A. M. Taylor said that the fact that the energy was obtained from water power at the one centre, whereas at the other centre it was obtained from steam power generated largely by foreign-bought coal, no doubt explained why it was decided to transmit over such a great distance.

In Great Britain all our energy was produced from coal, and the only question we had to consider was whether the costs of power at two centres would sufficiently differ to warrant transmission from one to the other.

He felt that on the question of long-distance transmission, engineers in this country had lost sight of three important points: (1) unless *very* large amounts of energy were transmitted the interest, sinking fund and repair charges produced the impression that it only paid to transmit over comparatively short distances; (2) the charges for transmission at pressures below 220 kV due to energy losses were higher than the fixed charges; (3) it was only by the employment of the very highest pressure that the capital outlay on a long line could be reduced so as to bring things into the realm of commercial possibility.

Prof. W. Cramp said that the great success with which the generating stations had been arranged to co-operate was a striking tribute to the spirit which animated the French electrical undertakings; it would be of interest to know something about the Government machinery by which such co-operation had been rendered possible. It was interesting to note that the highest voltage adopted on any cable was 60 kV, and that single-phase cables were used. Did the author mean single-phase concentric, or single-core? If the latter, it would be very interesting to know whether the cables were sheathed with lead, armour, or both, and whether the cores were hollow. The general principle enunciated in the paper were of universal importance, and were, he believed, stated for the first time. The benefit accruing from the combination of the railways with the industrial load was mentioned but not proved. It seemed as though the industrial load factor in France was higher than in England. For an industrial load without tramways, 28 per cent. was a high figure, except in a colliery district or in a region where there were large steel works. With respect to the motor coaches, it seemed that the goods locomotives had 1,500-volt motors, but for passenger trains it was considered advisable to use two 750-volt motors in series. The power, however, of the goods motors was greater than that for the passenger coaches, so that it would seem that the disadvantageous series arrangement was due to difficulties of commutation at high speed. There must have been some good reason to lead to an arrangement which permanently reduced the efficiency of control. The presence of a hydro-electric station would seem to make the load factor worse for the steam station, and since the former took the cream of the load the latter should be paid more per kWh supplied. He noticed that the elaborate guarding of overhead lines, which would be required in this country, was conspicuous by its absence. The expense of this addition must not be forgotten when comparing the capital costs of distribution with those which would obtain in England.

Dr. F. W. Carter said that the contact rail appeared to be a good mechanical job, but he had not hitherto met with a rail of the section shown. The contact tip being of small area would tend to cut the shoe in grooves, and he presumed the explanation of its use was that the shoe was able to keep the rail clear of ice. He noted that some of the locomotives were equipped for regeneration: from the appearance of the gradient profile he would not have thought the advantage of regeneration worth the complication. The freight locomotives were of the 2-bogie type, having all the weight on the driving wheels; this type was tending to become standard for the class of work in question.

Mr. J. D. Carlmark said the author stated that "the greater the coal consumption per mile of line the more favourable will be the financial results of the electrification." This would always be the case whether the supply was derived from water or steam power, as after electrification the railway should be worked more cheaply. Would not the density of traffic also reduce the capital and working cost per ton mile? as with very little increase in the cost of line and transmission equipment much greater earning capacity would result, and the station and other staff could deal more economically with the heavier traffic. He would like to know if the power transmission lines followed the railways, or if they were run more for the convenience of industrial load than for traction; if the transmission followed the railway, had there been or was there likely to be any electrical interference with telephone or telegraph circuits through the 150/220-kV power circuits, or electrolysis from the d.c. distribution, and, if so, had a successful cure been found? It was noticeable that France had departed from the Continental practice of providing power stations for the railway requirements only, and that they would take care of the industrial load as well; this, he thought, was a step in the right direction.

Mr. E. H. Croft believed he was correct in saying that a regenerative locomotive had been built for the Paris-Orleans by the Oerlikon Co. on the well-known system in which a stabilising resistance was used. In order to get latter regenerative curves, and simpler and safer operation when coming in on the line with regeneration, the Oerlikon Co. had introduced a system whereby the main starting resistances were continuously in service on certain notches of regeneration. It was agreed, of course, that the loss of energy was of no great importance, and regeneration was not put on locomotives with the prime object of saving energy, but rather for the important additional safety which it introduced. One type of high-speed locomotive was of the gearless type. In his opinion the low centre of gravity on this type of locomotive was an entirely retrograde step for high speeds. In addition, this type of locomotive would appear to have considerable un-sprung weight, which was also an undesirable feature, quite apart from the difficult design of the motor. A reasonably high centre of gravity was required, and the preponderance of mass should be towards the centre of the locomotive longitudinally. The driving ends should be provided with suitable bogies or trucks. In Switzerland and on the Paris-Orleans, he believed, the rail joints were not staggered, whereas in America the joints were always staggered. This had a great deal to do with the question of satisfactory high-speed running. There appeared to be certain points in favour of the unsymmetrical wheel arrangement, where the locomotives ran over staggered joints. The track of the Paris-Orleans was in no way equal to the track of British railways. Some time ago, when a high-speed locomotive was designed by a British firm, the question of the necessity of equalisation of the wheels was fully entered into, and it was decided that on British track ordinary springing was adequate, and that equalisation was not necessary. On American railways it was almost standard practice to equalise all wheels.

The Accumulator Makers' Association.

First Annual Dinner.

It does not seem to be generally realised, even in the electrical trade, what an important section of the industry the manufacture of accumulators has become. The above-named Association was formed some 14 years ago to stabilise the business, and consists of the six largest makers of stationary batteries in England.

Under the chairmanship of Mr. B. M. Drake, nearly 200 members and guests attended the first annual dinner of the Association at the Connaught Rooms, London, on Monday night, February 22nd.

Following the loyal toast, Mr. Ll. B. Atkinson proposed "The Association," remarking that manufacturers' associations, not trusts or combinations of manufacturers, had immense advantages, and allowed also that individualism combined with concerted action which was so dear to the Englishman's heart. To any industry an association of the right type was vital for its well-being, but no association was free from internal friction, the only means of overcoming which was personal contact of its members, of an association should, accordingly, not be too large. That the small man's business was just as important as that of the large man was one of the key-notes of success and harmony in any association. Such a body must also satisfy its customers, and not think that its interests were solely bound up in profits; its functions should be to eliminate wasteful competition, encourage standardisation, which was appreciated by the buyer, and carry out that concerted propaganda which was so very necessary. He was, however, not so satisfied that they were co-operating as they should do with the Research Association, and he asked for more help in that direction.

Mr. B. M. Drake, in responding, said that he had been asked to take the chair as he was amongst the earliest manufacturers of accumulators, having started some 43 years ago. After relating early experiences, he referred to the conditions which led to the formation of the Association. He realised that it was useless trying to shake the Electricity Commissioners' faith in alternating current. It had supplanted d.c. because of its superiority from the transmission point of view, but it had done so at the expense of reliability; lamps did not last so long and accidents were more frequent than when d.c. was in more general use. Interlinking would improve reliability, but for outlying districts a d.c. supply was undoubtedly more reliable.

With regard to the Government scheme, conditions would probably have been different if the intention had been to provide a net-work which would supply the whole country, irrespective of whether it paid or not, but the Government had backed out of that proposition. It was bound by predecessors' promises and statements that electricity was the cure for all ills. When the expense of such a scheme was realised the Government funked it, and the proposal now was to make supplies available in only such places where it would pay, but meanwhile country house and isolated village schemes, &c., were being held up. A statement regarding just how far the Government intended to go would avoid considerable delay and enable battery makers to get on with their schemes. The power engineers' aim was to obtain a high load factor, and Sir John Snell had himself admitted that fact, but the power rate was not available for accumulator charging if the energy so stored was to be used afterwards for lighting. That was a wrong policy, for a very good way of improving load factor would be to charge batteries in private houses, &c., by means of time switches at night, and if such a procedure was allowed it would result in at least 50 per cent. more electricity being sold by those who generated it. A good case could also be made out for double conversion in order to cope with the peak load, the batteries being charged at night when the station load was small. For the supply of villages also, the cost of the cable system was very much greater than that of the plant needed to give the supply; by using crude-oil engines with batteries, energy could be produced at well under 1d. per kWh. If such cases could be substantiated, and calculations he had made showed that they could, he thought battery makers would be prepared to reconsider some modified form of maintenance contract. He therefore appealed to the Commissioners to "live and let live," where they could do so without harming themselves in any way, especially in view of the facts that d.c. was more favoured by the public and also that it was not so dangerous in the case of shock.

"The Electrical Industry and the Guests" was proposed by Mr. D. P. Dunne. In acknowledging the debt which battery makers owed to other branches of the electrical industry, he remarked that that gathering was somewhat like the entertainment of the rich relatives by the poor ones, but in this case the poor relatives were of some use, and he appealed to the rich relatives to make use of them. When pig lead cost £18 per ton the purchaser was obtaining his accumulator, complete and charged, for £18 a ton, which fact was the highest tribute that could be paid to any industry. He had heard it said that it did not matter who got an order for batteries, because all the makers got something out of it. That was quite wrong, and he wished to stress the point that each maker obtained his own orders and he did not pay anyone anything out of the price he got for it.

In responding, Sir Hugo Hirst recalled some of his early experiences with the E.P.S.Co. In those days England led industrially. He was known to have welcomed the Government Electricity Bill; some of them, including himself, had had privileged information. The Bill was being amended from day to day, and he asked all to keep their powder dry until they knew what was going to happen. Mr. S. Baldwin's speech was a statesman's statement. The intention was to make electricity accessible to all, and with the co-operation of the user results would follow which would revolutionise the electrical industry. When one was spring cleaning, the house had first to be upset before it could be put in order again. The proposed Board would simply regulate matters; it did not wish to interfere with a single station, and the Bill was not a vote-catching device. The Government did not need that sort of thing; it was too strong, and it did not wish for nationalisation. It was giving the electrical industry a very great opportunity; "for goodness sake let us all take it."

Mr. R. A. Chattock also responded, saying that Sir Hugo's reply had covered the ground so admirably that he need do no more than follow the precedent which had been set and be reminiscent of the early days. His undertaking probably used more batteries than any other in this country. In spite of shortcomings, they were useful things to buy and use, but he thought that research might point the way to something even better in the future.

"Kindred Associations" was proposed by Mr. W. Peto, and in reply thereto Mr. T. E. Alger referred to the spirit of sympathy which was abroad that evening. If a little more adjustment could be made in price, no doubt the contractor would be able to get that "little bit on the extras" to which Mr. Peto had referred. That goodwill existed between contractors and accumulator manufacturers was evident from the fact that the two interests had recently met to improve their relationship, and although they had not met for two years previously, the meeting only lasted two hours.

During the dinner the Band of the Royal Regiment of Artillery rendered a selection of music, and between the speeches Mr. Thorpe Bates' songs were very much appreciated. John Henry was also in great form, and the organisers of the function are to be congratulated on the success of the evening.

The Electrical Industry and the Architect.

The Fifth E.D.A. Conference.

Mr. Walter Riggs presided at the fifth E.D.A. Conference of the session at Caxton Hall, Westminster, on February 19th. The subject was "The Electrical Industry and the Architect," a paper on which was read by Mr. G. Blair Imrie, of Messrs. Imrie & Angell, architects.

Mr. Imrie confined himself to the relations between the electrical industry and an architect specialising in houses. He said that his experience with the supply companies had been unfortunate. Broadly speaking, they did nothing whatever to advance or create demand, and no encouragement was given by them to those who were willing to spend money in developing estates. Exorbitant prices were charged for services, and some companies were extremely unbusinesslike in connecting up. Supply undertakings did not take sufficient trouble to get into touch with architects. The companies could do a great deal to stimulate demand by letting the architect know early that they were prepared to charge a low rate for a reasonable cooking and heating load. The speaker appealed for tariffs which the architect could understand, and quoted an example of the complicated nature of some tariffs. Passing to contractors, Mr. Imrie said that the contractor who would do a good job without worrying the architect with detail and without friction with the builder or other contractors, was likely to get repeat orders. Contractors did not always help the industry as a whole, inasmuch as when asked to estimate for wiring and to suggest a schedule they were inclined to cut the schedule to a minimum to keep the price down. It would be much better to give a very full schedule and to mention what could be saved by omissions. When sending in an estimate for electrical work to an architect the contractor did not always include information such as the name and address of the local supply company, the voltage, rates, &c. In the actual execution of work there was not nearly enough intelligent supervision by the contractors. If wiring rules could be simplified it would be to everyone's advantage; the safety of ordinary methods was ample, and it hardly seemed necessary to make regulations which increased the cost. Referring to fittings, Mr. Imrie said that the architect preferred a flush switch, and the nearer a cheap switch was to the flush pattern, and the smaller it was, the better. Power plugs were his pet abomination; why must they be so big? With regard to lighting fittings, he said that there were more people than was imagined who would pay more for good fittings if they could see them displayed under good conditions. His chief complaint against the makers of electric cookers and many other electrical appliances, however, was that the architect heard so little about them, although he was sent much literature about gas appliances. He looked forward to a time when the house which was not really "all electric" would be out of date. He was aware of the good work that the E.D.A. was doing, but thought that its scope should be enormously increased if results were to be obtained quickly.

Discussion.

Mr. W. R. Rawlings agreed that the electrical industry was checked by the methods of some of the supply authorities; there had been cases in which his own firm, as contractors, had guaranteed a minimum sum to the supply authority in order to get the work done. As regards methods of charging, he had seen very bad instances, but he thought that the one quoted was a joke. The wiring rules were necessary for sound work. Architects should endeavour to establish some standard of work. The obvious course was for them to go to a good firm for their electrical work. He hoped that professional men requiring the services of electrical contractors would only employ those who were registered. A great deal of valuable work was being done in standardising flush fittings and plugs, work in which the manufacturers and the British Engineering Standards Association were taking part, and in a very short time there would be standards for all those fittings. Every effort was being made by manufacturers to make plugs as small as possible consistent with satisfactory operation. Architects should so frame their agreements that the electrical contractor was not left at the mercy of the builder if he should go into bankruptcy, as occasionally happened.

Mr. F. C. Raphael said that a consulting engineer would not make an electrical contractor a sub-contractor to the builder. Speaking of architects in general, Mr. Raphael said that some of them were so conservative that they did not give the electrical industry a chance to get in. In numerous cases, too, the architect designed his building without any regard to where the cables for electric lighting and power were to go. He hoped there were not many cases in which such a complicated tariff as that mentioned by the author existed, but he had come across one nearly as bad supplied by a London supply company. The electrical contractor should not be expected to prepare a schedule for the architect when a consulting engineer was not employed. That was the work of the architect, as the purchaser's representative. If it were left to the contractor, who had to compete with others, it was not surprising if he cut the schedule down as low as possible in order to get the job. The architect should specify what type of plug he wanted. As regarded fittings, it often saved a great deal of trouble to make a rough sketch of what was wanted and get the fittings made specially. This cost very little more and was much better than making a selection in a showroom.

Mr. F. Selly (Marylebone) said that he did not consider that the picture given by the author of the attitude of supply authorities should be accepted as representing the position generally. His own authority did not charge for putting in the service, and in many cases a connection had been made the day following a telephone message. Electricity was now being supplied in Marylebone at about 33½ per cent. below the pre-war rate, and every possible assistance was given to the architect. He tried to get at the architect before any work was done, and the Marylebone Supply Department had been very successful in this respect.

Mr. Pulver (Messrs. Duncan, Watson & Co.) said that Mr. Raphael had suggested leaving chases for the cables before putting in concrete partitions, but it was questionable whether it was the cheaper way.

Mr. L. Gaster said the difficulty in some cases was that supply companies had no money to make extensions, and therefore were not in a position to push development. On the whole, however, he felt that the author, having had one unfortunate experience, had been misled by that into thinking that all supply authorities were the same. The architect should call in the consulting electrical engineer to help him. Designers of fittings should understand that the thing desired was good lighting.

Mr. F. T. Hall (Tottenham) said that there were very few supply authorities who did not want new business, and when difficult cases were investigated it would probably be found that there was a reason for the trouble. He had known cases in which architects would not answer letters or take the slightest notice of the supply authority desiring to put in the supply.

Mr. Grierson said that until recently the position of the companies had been insecure, and as a consequence they had not felt justified in pursuing a forward policy; that position would be altered by the Government's Bill. The question of tariffs had been discussed for years, and architects must realise that supply companies could not run long lengths of cable for nothing in order to get a nominal revenue. A two-part tariff must be introduced to get over that difficulty. There should be no complaint regarding the size of plugs, although they should be of the minimum size to give reliability. The average electrical contractor only looked at the matter from the point of view of the amount of money he could get for the installation. A schedule could be prepared for £250, and on the same job another schedule could be prepared for £50, and the £50 man usually got the order. He could never understand why the architect made the electrical contractor a sub-contractor to the builder, and he agreed that it was a doubtful advantage to cut the chase before the building was completed. It was not to be expected that architects would understand the wiring rules, but they cut out the "jerry" wireman.

Mr. H. Simon thought that architects were inclined to look too much upon the æsthetic point of view, rather than the utilitarian. Something of the æsthetic must be sacrificed if efficient lighting was desired. With Mr. Rawlings, he expressed the hope that architects would deal only with registered electrical contractors. Referring to tariffs, the speaker said that he knew of a London company which had quoted similar arrangement to that mentioned in the paper. That simply hindered progress, and in the case in question his client had abandoned his idea to have electric cooking, &c.

Mr. Strange (Tunbridge Wells) agreed that the quoted tariff was complicated, but it worked out extraordinarily cheap.

Mr. J. W. Beauchamp said that it was not only desirable to put in more outlets in buildings; heavier cable should be used to make the sale of apparatus later on still more easy. Architects should allow generous accommodation for sub-stations in big buildings, for they saved space elsewhere when electricity was used. So far as plugs were concerned he did not think the objection was so much to their large diameter as to the fact that too many of them projected such a long way from the wall. As to tariffs, a simple two part system was the ideal.

Mr. Imrie, replying to the discussion, said that as regarded the wiring rules, all that was required was by-laws to prevent the bad workman doing bad work. In some contracts he had as many as 12 sub-contractors; he would not like to have to deal with 12 consulting engineers. His own method was to put himself absolutely in the hands of a reliable contractor. He always saw to that the sub-contractor was paid, because it was very necessary, apart from other considerations, in the interests of the client. His small experience of electrical consulting engineers had shown that they were of great assistance, but as regarded other branches of building work he would rather be without consulting engineers. The question of cutting chases during building was an expensive matter, and 50 per cent. might easily be added to the cost. As to the schedules, he did not mean a detailed specification, but

price per point. For private house work he was convinced that it was a mistake to try and plan the points during building, as the client or his wife would come along afterwards and alter all the positions. He claimed that the tariff which he had mentioned was a fair sample of the tariffs of the supply companies which he had met in the course of his work. He would avail himself of the suggestion to bring such cases to the notice of Mr. Beauchamp, and as to the point that it did not pay supply companies to lay mains when the revenue might only be 12s. 6d. a quarter, his quarrel was that the supply companies did nothing to induce the consumer to increase it to £12 10s.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Electric Refrigerator.

A recent production of the International G.E.C. of New York, is an electric refrigerator, fig. 1, the mechanism of which, it is claimed, is totally enclosed and practically silent in operation, requiring no attention as regards lubrication. The motor and compressor are mounted vertically on the same shaft and all the moving parts are contained in the refrigerant case; the cylinder pressures are equalised by a valve device, allowing the motor to commence on no-load.

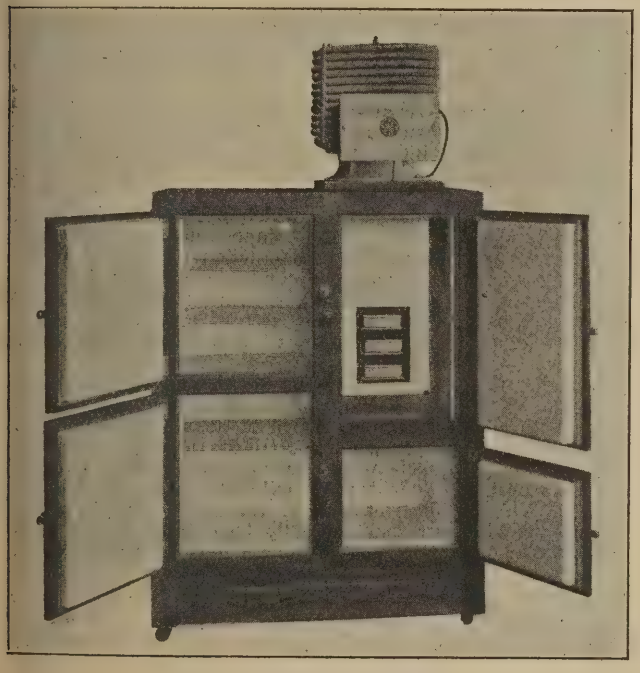

Fig. 1.—Electric Refrigerator.

The principle of operation is the evaporation of a liquid refrigerant (sulphur diozide) in coils submerged in brine. Heat is transferred to the brine tank from the surrounding air, and then to the refrigerant during evaporation. A low pressure is maintained in the coil by means of suction from the compressor. The gas is then passed through a condenser coil and chilled and liquified under a relatively high pressure. The condensed liquid is collected in a float chamber and passed again into the evaporator.

Complete thermostatic and electrical control are provided by means of suitable gear contained in a box on the front of the unit. The automatic control is so adjusted that the temperature of the brine tank is maintained between 16 degrees and 24 deg. F.

Investigations made by the producers show that a temperature range of from 40 to 50 deg. F., depending on the room temperature, is best adapted for food preservation, and the area of the brine tank is claimed to be suitable to maintain that range in the food compartment.

A New Watertight Plug and Switch.

The accompanying illustration, fig. 2, shows a new watertight plug and switch combination, a production of Messrs. James Scott & Co., 340, Royal Liver Buildings, Liverpool, which is designed primarily for use in connection with the lighting of ships during loading and unloading operations; but it should prove useful in outdoor and wet places where a plug control for electric circuits is necessary. The switch and plug are housed in a suitable metal case and the plug is inserted from the bottom. The latter is locked when in position so that it cannot be pulled out by means of the cable; it can also be put in the "off" position without removing it entirely from the case, by virtue of the pin and slot connection between the plug barrel and the case projection. The plug contacts are arranged concentrically, and are accommodated in split sprung terminal sockets suitably mounted and insulated in the case. The top socket, or "inner" connection moves vertically up and down, and is pressed downwards by a spiral spring wound about a sliding

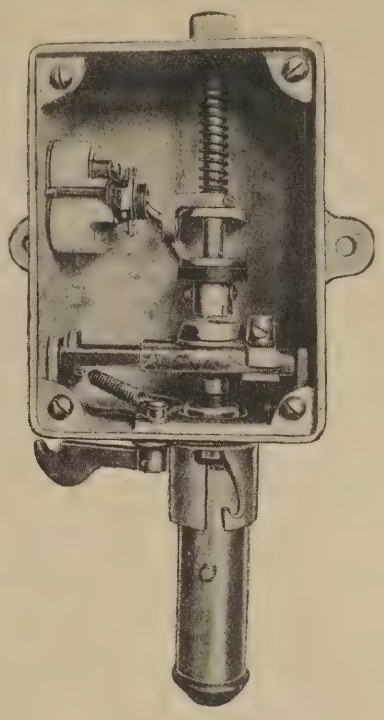

Fig. 2.—Watertight Plug-Switch.

projecting spindle. Attached to this is an eyed angle piece which accommodates the knob of an ordinary Crabtree switch and is so placed that the switch is put "on" or "off" before the plug is connected or disconnected, thus preventing arcing at the plug terminals. A metal flap, under the influence of a spring, closes the aperture in the case, internally, immediately the plug is withdrawn, and it is removed again to admit the plug by means of a small handle under the case. The device is shown with the cover removed.

A Low-C.P. Lamp.

We have received from Messrs. Philips Lamps, Ltd., of 60, Wilson Street, London, E.C.2, a sample of their "Savelite" lamp, which is intended for use wherever a lamp of low consumption and candle power is required. It is intended for use on alternating-current circuits only, and appears to contain in the base a tiny transformer. The lamp has an opal bulb, and gives about 1½ candle power. It is claimed that with it one can obtain 50 hours of light for one penny. It is a very convenient little device.

An Improved Battery Charger.

Fig. 3 shows one of a range of Hobart constant-potential battery chargers, designed for short-period, heavy-current charges, which is being marketed in this country by Mr.

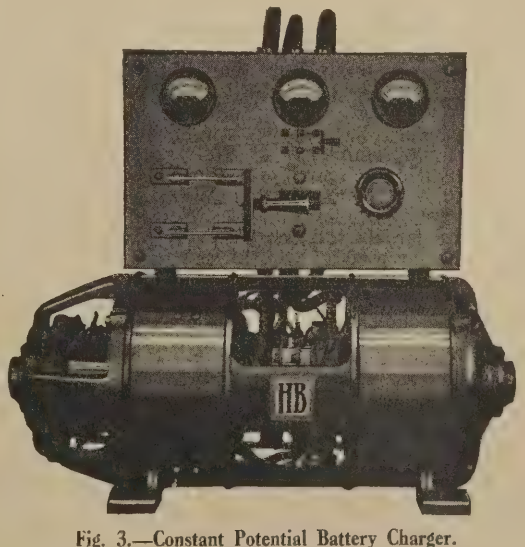

Fig. 3.—Constant Potential Battery Charger.

F. J. Gordon, 91, Moorgate, London, E.C.2. The machine and the control board are arranged as one unit. The motor is fitted with ball bearings, and is wound for non-reversing voltage regulation. The current is automatically rapidly reduced, it is claimed, as the battery becomes nearly charged, thus reducing the heating and gassing. The range covers up to 500 A outfits.

Road Transport and its Possible Developments.

(Abstracts of Addresses delivered at a Joint Meeting of the Institutions of Civil, Mechanical and Electrical Engineers.)

The annual joint meeting of the Institution of Civil Engineers (Birmingham and District Association), the Institution of Mechanical Engineers (Midland Branch), and the Institution of Electrical Engineers (South Midland Centre) was held at the Council House, Birmingham, on Friday, February 12th, when addresses on the above subject were read by Major F. C. Cook, D.S.O., M.C. (Civil Engineers), Sir John Thornycroft, K.B.E. (Mechanical Engineers), and Mr. C. Owen Silvers (Electrical Engineers).

Major F. C. Cook dealt with the administration of the highways, their design and construction, and the effects of heavy traffic upon them. He said: "The essentials of the road for the development of road transport can be briefly put as follows:—(*a*) It must be so sited as to provide the most direct route between the termini, whilst providing easy means of communication with intermediate centres of population. (*b*) It must be constructed with due regard to economy, so that all traffic likely to come upon it can proceed at its maximum economic speed, without damage to the track or vehicle and with safety to other road users."

Sir John Thornycroft's subjects were the types of vehicle employed, and the economics of road transport. Referring to passenger services, he said: "For work in large cities, where they are used to deal with very dense traffic, the double-decker as used in London for carrying about 50 people has a legitimate place, but by far the greatest field seems to exist for single-deck types carrying either 20 or about 30 passengers. A 20-seat vehicle can be built to weigh under 50 cwt. and not to exceed dimensions which make it handy enough to traverse by-roads without interfering with other traffic. If built within this limit of weight it has the additional advantage that it is not restricted as regards speed to a greater extent than any motor car, under the Ministry of Transport's proposed new regulations.

"In considering the economics of transport by road, one must obviously take into account both the cost of the transport services, made up of the running costs of the vehicle, depreciation, &c., and also the costs connected with the roads on which they run, but I do not think anyone has, as yet, discovered a method of correctly applying the road costs, and the most we can do at the present time is to arrive at some general conclusions. . . . The wear and tear of roads is dependent both upon the travelling load and the speed at which it is moved. The speed is in the hands of the driver of the vehicle, but the travelling load, being made up of the weight of the vehicle and what it carries, is dependent on the skill of the engineers who produce them. It would appear from what politicians are saying that it is being taken for granted by them that the heavier goods-carrying vehicles are responsible for the greater part of the road damage. No doubt heavy axle loads on unsuitable roads are responsible for an undue proportion of damage, but engineers, I think, will agree with me that the total of the ton miles applicable to the different types of vehicle, qualified in some way by the speed, is the correct way of arriving at their share of responsibility."

Mr. C. Owen Silvers dealt with the electrical aspect of the subject, the following being an abstract of his remarks:—

For moving large bodies of people safely, swiftly, comfortably and economically in large cities and industrial areas, it would be impossible to substitute motor omnibuses or trolley vehicles and still carry passengers at the low fares now charged on the tramcars. The modern tramcar is constructed to seat up to 84 passengers and with the proposed restriction of size and weight of motor omnibuses and trolley omnibuses, it will be impossible to seat many more than 50 passengers in a railless vehicle. A fair method of cost comparison is based on the average seating capacity of the vehicles and the following figures show the cost per 100 seat miles for tramways, trolley vehicles and motor omnibuses at Wolverhampton and Edinburgh for 1924-25:—Tramways: Wolverhampton, 39.56d.; Edinburgh, 30.69d. Motor 'buses: Wolverhampton, 44.56d.; Edinburgh, 55.24d. Trolley vehicles: Wolverhampton, 37.34d.

The costs are largely influenced by the seating capacity of the vehicle and large 80-seater vehicles can only be employed when the number of passengers is sufficient reasonably to fill those vehicles and at the same time warrant a frequent service which will sufficiently employ the expensive permanent way. Tramways suffer under certain statutory disabilities, and in many ways have not equal opportunity and obligations with motor omnibus competition. With the provision of wide arterial roads, sleeper tracks and tramway sub-ways, the tramcar is likely to hold its own in the transport world for many years to come. Roads to-day should be built to carry the ordinary mechanical traction of the district and the modern trolley vehicle comes within this category; there are innumerable instances where the electrically operated mobile trolley vehicle can be applied more successfully than either the tramcar or the motor omnibus. The pioneers of the electrical trolley vehicle first operated vehicles in this country in 1911 and 1912, and a new lease of life was given to it in 1922, when Birmingham, followed shortly afterwards by Wolverhampton, decided to scrap some worn-out single tramway track and substitute up-to-date trolley vehicles. Both these experiments were very successful and in the Wolverhampton case the traffic on the route increased by 33 per cent. The rate of acceleration of the trolley vehicle has been found to be about 2½ miles per hour per second, without undue stress on the vehicle, tires, or the road. Fifteen or sixteen authorities are now running trolley vehicles in this country, and many others have trolley vehicle routes under construction.

It appears that the battery vehicle is not holding its own. I believe that this is due to unfortunate circumstances and that the potential field for the utilisation of electricity for this purpose is enormous. The more extensive use of these vehicles in the past has, in my opinion, been prevented by, among other things, the lack of organisation by the supply authorities for the provision of cheap energy and plentiful charging stations. The manufacturers have taken a narrow view of business and based their prices on too small an output, making the capital cost high when compared with that of a petrol vehicle. In this country there are approximately 8,000 battery vehicles and trucks in use, in connection with the principal trades; when large undertakings like Messrs. Harrods and the L.M.S. Railway can find a place for a fleet of electrics amongst their petrol-driven vehicles, it is obvious that there is an immense field for their use in frequent-stop town work. It is calculated that 150 electric vehicles require one million "off peak" units every year. In both Germany and America the battery vehicle is rapidly growing in popularity, and its use is on the increase in both France and Italy.

In an address by Mr. Cowie on: "Why the American Railway Express Company runs in excess of 1,800 Electric Trucks,"* he said: "The economy in operation of the electric is due to the relatively small amount of time necessary for maintenance and repair, a result of the extremely small number of parts of the electric, its freedom from vibration and its limited speed."

The efficiency and reliability of the petrol vehicle is largely due to the electrical engineer in perfecting the magneto ignition and the electric lighting and starting systems employed.

Speaking on road transport matters in general, the one outstanding consideration is the hard fact that the dimensions of the thoroughfares in our towns, which were planned without any notion of present-day traffic, impose definite limitations upon street use in all centres of population. The local authority is the custodian of the roads and is responsible for their maintenance. There is nothing so striking in the whole range of local taxation as the increased cost of road maintenance, and there is nothing so deceptive as the mere use of aggregate figures, as compared with percentages.

Regarding the question of public health and petrol exhaust gases, we all know the effect of being shut up in a small garage with a petrol engine—carbon monoxide poisoning in a very short time. As to whether a dilute mixture of carbon monoxide and air, such as we now get in London, is detrimental to health, I took this up with Dr. Jolly, the Wolverhampton Medical Officer of Health, who said: "If this poison in concentrated form could actually have fatal results, it is highly probable that in a more diluted form it would still be injurious to health."

Discussion.

Mr. F. J. Moffett commented on the wonderful results that could be, and were being, obtained by the battery vehicle. Electrical engineers were not at the end of their resources and they hoped to be able to improve on the present storage battery. It was rather curious to contrast the storage of electrical energy with the storage of gas. The electrical vehicle was largely made up of its battery; but take the storage of gas as it was done during the war years. There was a large gas bag on the roof, the effect of which was actually to reduce the weight of the vehicle on the road. Most physical processes were reversible; why should it not be possible to combine oxygen and hydrogen in such a way as to get electric current generated? If that could be carried out the weight of the electric storage battery would be very considerably reduced.

Major Brooke said he had had details before him quite recently of a very large bogey vehicle, capable of accommodating some 70 passengers seated, and, he believed, very nearly an equal number of passengers standing. This vehicle had a petrol-electric drive and it seemed to him that a drive of that kind was particularly apt.

Mr. Malins said no mention had been made in the course of the discussion of the hindrances to other users of the roads. He suggested that that was a serious point. With regard to traffic regulations in town and city, it often happened that laden lorries were held up and had to lose a lot of time waiting, for instance, for tramcars, the roads being too narrow to accommodate a double line of traffic.

Major Aveling suggested that the whole kernel of the problem of motor traffic was the relation of the total travelling load to the carrying load and the need of increasing the useful or carrying load. It would be useful to know the ratio of this in the electric vehicle. As an engineer he thought the first complaint against the tramcar was that it did not begin and end its job; which was to lift the passenger off the footway, and set him down on it.

Mr. A. Reeve thought permanent tramways were not likely to be developed extensively in the future. Petrol-electric

* The American term for lorry is truck.

vehicles were certainly gaining ground in the U.S.A. and might still continue.

Mr. Shine said the representative of the electrical profession had enormous courage in talking of the battery vehicle. He did not think the argument raised concerning the battery vehicle could be sustained. He had the pleasure of driving an electric vehicle 20 years ago, and he did not think the type had very much improved to-day. It was much easier to sell a Ford than a battery vehicle. It was interesting to note that the people who bought battery vehicles were usually corporations who did not worry very much whether the job made a profit or loss. Possibly this was the reason why the petrol-electric vehicle was forging ahead in America.

Mr. Joseph visualised the time when charged batteries might be bought at wayside shops just as a can of petrol was to-day. He believed such a development would make the electric vehicle a possibility for urban traffic.

Dr. Lanchester, in commenting on the discussion, said a good deal had been said about the future of the battery on vehicles, but it must be remembered that it had taken a long time to build up the cells to perfection and there was nothing else in sight. The weak point of the cell lay in the question of internal resistance. Mr. Moffett had suggested that it might be possible to reverse the hydrogen and the oxygen: he believed that in the laboratory it could be done. Concerning the electric 'bus with a two-motor drive as used in America, referred to by Mr. Silvers, he pointed out that this was not new, as 16 years ago, he was asked to get out a 'bus for the London traffic for carrying 35 cwt. It came within the weight—the units were put on either side—but then it was not a great success and did not show signs of vitality.

United States Industry and Commerce.

Expansion of Exports.

A report dated September-October, 1925, upon the finance, industry, and commerce of the United States*, has been prepared for the Department of Overseas Trade by Mr. J. Joyce Broderick, Commercial Counseller at the British Embassy, Washington. The introduction to the report says that in the twelve months prior to the period covered by the report conditions were a trifle discouraging, though not really depressed; in the succeeding year there was a striking improvement. The better outlook in Europe is said to have had a strong psychological influence upon American finance and industry. In 1924 there was a substantial rise in the value of exports, although the figure was still well behind those of the "boom" years 1919 and 1920. Imports were slightly reduced, their relationship to exports falling from 91 to 78.6 per cent. There was a balance in favour of the United States of $980 millions as compared with $375 millions in 1923. In the five pre-war years the balance averaged $477 millions; in 1919 it rose to $4,016 millions. It is considered that by the payment of their obligations, the debtors to the United States will reduce this favourable balance.

Electrical Exports.

Electrical machinery and apparatus rank fifth in the list of America's exports of manufactured goods. In 1924 the total value of exports of this class was $1,588 millions; the share of the electrical industry was about $70 millions, as compared with $60 millions in 1923. The largest purchaser in this group was Canada, but the exports were fairly evenly distributed throughout European, Latin-American and Far Eastern countries. Exports to South America and Europe declined in 1924, but Australia took increased quantities of telephone equipment, electric motors, switchboards and switchgear. Great Britain was the largest European purchaser, importing principally household appliances, electric motors, and insulated wires and cables. From a list of the hundred leading exports during 1924 appended to the report it is seen that the most important section of the electrical group was electric motors, starters, and controllers, which had a value of $11,761,000. Electric switches, meters, &c., were next with a value of $7,602,000. Electric transformers, converters, &c., were valued at $6,811,000; radio apparatus was valued at $6,031,000 (as compared with $3,448,000 in 1923); and electric generators at $5,368,000. As is indicated, the United States radio industry has made great progress. Canada was the principal market in 1924, taking about two-fifths ($2,413,687) of the total exports of radio apparatus. Australia also proved a lucrative field, buying over a million dollars' worth of American apparatus. Other notable markets were Mexico and Japan, but American radio equipment of various kinds was shipped to no fewer than eighty different foreign markets.

Electrical Expansion.

The report has a good deal to say regarding the strides which the United States has made in the use of electricity in the last few years. It is shown that the mean daily output rose from 106.7 million kWh in 1919 to 174.2 million kWh in the first five months of 1925. The production per head of the population in 1924 was 500 kWh; in 1912 it was 122 kWh. The extent of the employment of electric power in industry is illustrated by a statement that there were in 1923 over two million motors with an aggregate capacity of more than 22 million h.p. installed in manufacturing works. In 1914, it is stated, there were only 769,000 motors with an aggregate capacity of less than 9 million h.p. To show the magnitude of the domestic demand, it is stated that in 1924 there were in use in American homes over eight million electric irons, 4½ million vacuum cleaners, three million electric washing machines, and an equal number of electric fans. There were also about three million radio sets. From 12 to 14 million houses and apartments are wired for electricity and there are at least 16 million users out of a total of 26 million families. New structures, whether they be private houses, apartment houses, office buildings, shops or factories, are fitted with electric wiring as a matter of course. Moreover, the price of electricity has been generally reduced as the demand has expanded, the cost of production being diminished, as well as by a strong tendency to concentrate the control of the electric power industry in the hands of a relatively small number of large regional holding corporations. These consolidations are resulting in a much more efficient operation of the various stations and the economies effected are producing net revenues for the companies in spite of heavy capital expenditure occasioned by new construction. The electrical equipment industry is enjoying a period of continued prosperity with minor fluctuations.

Foreign Loans.

The heavy volume of foreign obligations placed on the American investment market continues to attract much attention, but is scarcely surprising in the light of the country's excess gold holdings, of the abundant supply of funds, of a continuing favourable merchandise trade balance, and of the important changes that recent years have witnessed in the invisible items of the country's international balance sheet. Loans have been placed in New York by many foreign countries. Germany has raised a number of industrial loans and among them are the following:—Thyssen Iron & Steel Works ($12 millions at 7.35 per cent. net); the A.E.G. ($10 millions at 7.37 per cent.); Siemens & Halske ($10 millions at 7.70 per cent.); and the Electric Power Corporation ($5 millions at 7.67 per cent.). Apart from public loans it is estimated that $100 millions was borrowed privately by German industrialists. Among the Japanese public utility corporations which placed loans during the early part of 1925 were the Toho Electric Power Co. ($15 millions), and the Ujigawa Electric Power Co. ($14 millions).

Trading Methods.

The report states that there is usually an opening in the country for any high-class product if its quality and characteristics are exclusive or decidedly superior to those of similar articles of domestic manufacture. New York is the great import and export centre, and, with certain reservations, is the logical distributing point for British goods. There are, however, various reasons why it is not always advisable to place a sole agency for the whole of the United States in the hands of a concern established only in New York. The larger importing houses claim to, and may be able to, cover the whole of the United States; but the enormous extent of the country suggests that it is generally more desirable to divide it into its four natural geographical divisions, *viz.*: The East, Middle West, West, and South. The eastern seaboard can be easily taken care of from New York, but for the Middle West the strategic point would be Chicago or perhaps St. Louis. On the Pacific Coast, San Francisco and Los Angeles, Portland, Seattle and even Vancouver are all suitable points, and in the South it is generally agreed that Atlanta is the most convenient centre. In New York, and perhaps to a slightly less extent in Chicago, the distributive system is of long standing and there is little difficulty, as a rule, in finding agents for British firms who have a suitable line of merchandise to offer. It is difficult at present to find in the Southern States suitable representatives for British firms. An agent must do a good deal of unremunerative pioneer work before any appreciable results accrue, and there is little inducement to undertake this unless the principals in England are willing and able to lend considerable support in the way of advertising, &c. This support should in the long run prove to be very worth while. The high cost of living in the United States naturally requires a high level of remuneration. Salaries, wages, &c., are all on a very much higher level than in Europe, consequently an agent's overhead expenses are considerably greater than in similar British and Continental establishments, especially as the distances to be covered are exceedingly greater.

* Stationery Office, 3s. 6d. net.

Patents and Trade Marks.

In the course of last year the United States Patent Office was taken from under the control of the Department of the Interior and placed under that of the Department of Commerce, and an announcement was made by the latter to the effect that immediate steps would be taken to secure for American owners of patents registered in foreign countries all the advantages that are now extended to foreign owners of patents registered in the United States. A committee of American patent experts, headed by the Commissioner of Patents, was appointed to attend the international conference on the protection of industrial property arranged to be held at The Hague in October, and was said to be charged with the duty of securing an international agreement under which American owners of patents might have their rights protected without being forced to set up manufacturing establishments abroad. The general trade-mark law now in effect in the United States came into force in 1905 and apparently extended protection to owners of trade-marks registered under it for a period of twenty years only, after which period the marks would have to be re-registered. Owners of valuable trade-marks registered in 1905 who fail to apply for renewals run serious risks of infringement and even of complete loss of protection.

Electrical Exports of the United States.

Below are shown the values of electrical machinery and apparatus exported from the United States during the 12 months ended December last. Comparative figures for the year 1924 are added, and notes of increases or decreases are also given.

	1924. $	1925. $	Inc. or dec. $
Electrical machinery and apparatus (total)	69,928,000	73,558,000	+3,630,000
Generators—			
Direct current—			
Under 500 kW	1,067,000	848,000	− 219,000
500 kW and over	850,000	428,000	− 422,000
Alternating current—			
Under 2,000 kVA	169,000	324,000	+ 155,000
2,000 kVA and over	1,157,000	1,880,000	+ 723,000
Steam turbine generator sets	75,000	565,000	+ 490,000
Accessories and parts for generators	1,270,000	1,089,000	− 181,000
Self-contained lighting outfits	780,000	1,076,000	+ 296,000
Batteries—			
Flashlight batteries	893,000	1,214,000	+ 321,000
Other primary batteries	818,000	1,204,000	+ 386,000
Storage batteries	2,883,000	2,681,000	− 202,000
Transforming or converting apparatus—			
Power transformers	3,286,000	2,175,000	−1,111,000
Other transformers	2,368,000	1,315,000	−1,053,000
Rectifiers, double-current, motor generators, dynamotors, synchronous, and other converters	1,157,000	966,000	− 191,000
Transmission and distribution apparatus—			
Switchboard panels, except telephone	2,163,000	2,305,000	+ 142,000
Switches and circuit breakers over 10 A	2,245,000	2,424,000	+ 179,000
Fuses and fuse blocks	282,000	343,000	+ 61,000
Watt-hour and other measuring meters	624,000	447,000	− 177,000
Volt, watt and ampere meters and other recording, indicating and testing apparatus	1,367,000	1,696,000	+ 329,000
Lightning arresters, choke coils, reactors and other protective devices	920,000	707,000	− 213,000
Motors, starters, and controllers—			
Motors under 1 h.p.	1,687,000	2,102,000	+ 415,000
Stationary motors—			
1 to 200 h.p.	2,392,000	2,472,000	+ 80,000
Over 200 h.p.	576,000	604,000	+ 28,000
Railway motors	1,328,000	808,000	− 520,000
Starting and controlling equipment—			
For industrial motors	1,429,000	2,042,000	+ 613,000
For electric railway and vehicle motors	107,000	278,000	+ 171,000
Accessories and parts for motors	1,998,000	2,040,000	+ 42,000
Electric locomotives—			
Railway	1,923,000	482,000	−1,441,000
Mining and industrial	320,000	331,000	+ 11,000
Electric lamps—			
Metal filament	1,070,000	1,250,000*	+ 180,000
Other electric lamps	365,000	244,000	− 121,000
Flashlights	776,000	1,342,000	+ 566,000
Searchlights and projectors	381,000	562,000	+ 181,000
Electrical appliances—			
Electric fans	1,028,000	917,000	− 111,000
Motor-driven household devices	888,000	1,206,000	+ 318,000
Domestic heating and cooking devices	1,104,000	1,340,000	+ 236,000
Industrial electric furnaces and ovens	240,000	252,000	+ 12,000
Therapeutic apparatus, X-ray machines, galvanic and faradic batteries, &c.	1,058,000	1,415,000	+ 357,000
Signal and communication devices—			
Radio apparatus	6,031,000	9,904,000	+3,873,000
Telegraph apparatus	516,000	497,000	− 19,000
Telephone apparatus—			
Magneto telephones	183,000	125,000	− 58,000
Other telephones	543,000	498,000	− 45,000
Telephone switchboards	1,161,000	799,000	− 362,000
Other telephone equipment	2,096,000	2,298,000	+ 202,000
Railway signals, switches, and attachments	964,000	803,000	− 161,000
Bells, buzzers, annunciators and alarms	149,000	171,000	+ 22,000
Other electrical apparatus—			
Spark plugs, magnetos, and other ignition apparatus	1,911,000	2,708,000	+ 797,000
Insulating material	1,536,000	1,545,000	+ 9,000
Metal conduit, outlet, and switch boxes	574,000	797,000	+ 223,000
Sockets, receptacles and lighting switches	1,278,000	1,595,000	+ 317,000
Electric lighting fixtures, interior and street	755,000	1,314,000	+ 559,000
Other wiring supplies and line material	1,149,000	1,132,000	− 17,000
Miscellaneous	7,938,000	6,883,000	−1,055,000
The following, not included in the total of electrical apparatus, were also exported :—			
Insulated iron or steel wire or cable	398,000	268,000	− 130,000
Insulated copper wire or cable	3,896,000	4,900,000	+1,004,000

* These were distributed as follows :—Europe, $34,000; Canada, $23,000; Central America, $96,000; Mexico, $274,000; British West Indies, $22,000; Cuba, $196,000; Argentina, $128,000; Brazil, $21,000; Chile, $55,000; other South American countries, $91,000; Australia, $118,000; New Zealand, $33,000; British South Africa, $26,000; other countries, $132,000.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Unemployment.—On February 23rd, Mr. Betterton, Parliamentary Secretary to the Ministry of Labour, informed Captain O'Connor that the unemployed persons in the electrical engineering trade on January 25th, 1926, were 4,929, in the marine engineering trade on the same date there were 13,372, in the constructional engineering trade 3,150, and in engineering generally 76,351.

The Electricity Bill.—On February 22nd, Mr. Remer asked the Prime Minister when the text of the Electricity Bill would be circulated; and if he would give an undertaking that the second reading would not take place until Members had had at least a fortnight to study the proposals.

Mr. Baldwin said that it was hoped that the text would be circulated shortly, and it was not proposed to ask for a second reading until a reasonable time after circulation.

According to *The Times*, the Bill is to receive its second reading on March 23rd.

Imported Wire.—On February 24th, Sir H. Brittain asked the Minister of Health whether he was taking any steps to prevent imported insulated electric wire, in which reclaimed rubber had been used, being utilised in buildings in the erection of which his department had jurisdiction, in view of the risk of fire arising owing to the reclaimed rubber disintegrating and setting up short circuits.

Sir K. Wood said that the matter referred to was one within the jurisdiction of local authorities.

Metropolitan Electric Supply Company Bill.—On February 24th, on the order for the second reading of this Bill, Major Attlee moved its rejection. He explained that the Metropolitan Electric Supply Company was a company which, joined with nine others, derived its electrical power from the

London Power Company. It sought by the Bill to obtain extended powers in its present area of supply, and to increase its area both inside the area of the Joint Electricity Authority for London and the Home Counties, and also in a very wide area in a number of counties as far away as Hampshire and Buckinghamshire. There was a general objection to upsetting the work that was done by Parliament last summer, when by two Electricity Supply Bills, and by the London and Home Counties Order, they settled in broad outline the electricity programme of London. The present Bill took little or no account of the Joint Electricity Authority then set up but proposed to set up another power company in the West of London. There were some 63 opponents of the Bill, among them being many local authorities. The greater part of the Bill, so far as it related to the existing area of supply of the company, was quite unnecessary, because by collaboration, and through the Joint Electricity Authority, on which the company was represented, the whole of what it was sought to do by the new powers in the Bill could be effected. Secondly, in the added area, which was within the Joint Electricity Authority's area, the Bill would hand over certain territory to the company, and would actually infringe the rights of bulk supply given to the Authority last July. He also objected to giving in any part of the outside area an absolute freehold to any company. The Bill also anticipated the electricity proposals of the Government.

Col. Ashley, the Minister of Transport, said that the Bill did not in any way impinge on the Government's proposals, in that it was not concerned with a generating station. The Government had no objection to the Bill on that account. It would undoubtedly be beneficial to the large area outside the area under the jurisdiction of the Joint Electricity Authority. He understood from private conferences that the company was willing to meet that Authority along nine-tenths of the way, and that there was only one point of difference which stood between them and complete agreement. He advised the House to give the Bill a second reading, so that it could be carefully considered in committee.

The second reading was, however, defeated by 128 votes to 125.

Miners' Nystagmus.—On February 25th, asked by Mr. Spencer whether he was aware that nystagmus was on the increase among coal miners and whether he intended to give effect to the recommendation of the Medical Research Committee with regard to a higher standard of illumination by making it compulsory to provide this, Colonel Lane Fox, Secretary for Mines, said that the incidence of miners' nystagmus was still very heavy, but the total number of cases in 1924 was slightly less than in 1923; the number of new cases declined both in 1923 and 1924 and he hoped would continue to do so. He expected before long to be able to fix a higher candle-power standard for flame safety lamps. As regarded electric safety lamps, the present standard of candle power was much higher than the standard for flame lamps and he was advised that it was not yet practicable to raise it.

Legal.

Globe & Simpson, Ltd., v. T. W. Globe & R. C. Globe.

In the King's Bench Division recently, Lords Justices Scrutton and Sargent heard an appeal by Thomas Wilson Globe and his son, Reginald C. Globe, of Broad Lane, Sheffield, electrical car factors, from a decision of Judge Lias in the Sheffield County Court on August 14th last.

For the appellants, Mr. F. J. O. Coddington explained that the defendants sold their business to Globe & Simpson, Ltd., and both became directors of the new company. On March 24th, 1924, Mr. R. C. Globe, who had a written contract with the company, at a directors' meeting expressed a desire that his agreement should be cancelled, and instructions were given to carry this out. There were two relevant clauses in the contract: That Mr. R. C. Globe should be paid a salary and 2½ per cent. commission on amounts earned by the company; and the other, the restrictive covenant, preventing both father and son from starting business within a certain radius. The defendants started a business in Sheffield after the son had resigned, and the company brought the action. The Judge found for the plaintiffs, granted an injunction, and awarded £2 damages, and against this the defendants appealed.

Counsel submitted that the restrictive covenant not to start business in Sheffield or within a 25-mile radius was too wide and in restraint of trade. Without calling on Counsel for the respondents the Court dismissed the appeal.

Theft of Electricity.

For having abstracted and used electricity belonging to the Chesterfield Corporation after his supply had been cut off because he had not paid his previous account, Ernest Seaton, butcher, Chesterfield, was recently fined £1 by the local magistrates. Mr. S. Walker, who prosecuted, stated that on December 30th the defendant's supply was cut off because he had not paid his account. Lights were subsequently seen in his shop, and on January 26th the seals of the fuses controlling the supply were found to have been tampered with, and the meter showed a further consumption of 4 kWh. Defendant said that on the night his supply was cut off, he posted a cheque for the account mentioned, and asked for a pre-payment meter to be installed. Nothing further was done however; he admitted using the light.

False Pretences Charge.

At Old Street Police Court on February 24th, Edward M. G. Coates (known as A. W. Green), omnibus conductor, of Manor Park, E., was charged on remand with obtaining a quantity of radio accessories, value £12 12s. 2d., the property of Messrs. Brown Brothers, Great Eastern Street, E., by false pretences, with intent to defraud. There was a further charge of attempting to obtain a quantity of accessories, value £27 15s., also the property of Messrs. Brown Bros., by false pretences. Defendant had previously pleaded guilty, and it had been explained that the defendant was not in any way a customer. The firm had a customer named Johnson, at Manor Park, and on February 2nd defendant presented an order purporting to come from Mr. Johnson for goods to the value of £12 12s. The goods were delivered to him and the usual invoice was sent to Mr. Johnson, who said he had not ordered the goods. On February 16th defendant called again with a form of Johnson's, and as it was for rather a large order an assistant became suspicious, Mr. Johnson was telephoned, and it was ascertained that he had not sent anyone for goods. Defendant was given into custody. Det.-Sergt. Law now stated that all the property had been recovered. Defendant's licence as a 'bus conductor would be taken away for the present. Mr. R. E. Seaton, for the defence, said his client was a man of excellent character and had been perfectly honest. Defendant was bound over and placed on probation, and ordered to pay £2 2s. costs to the prosecution.

Marconi's Wireless Telegraph Co., Ltd., v. Shaftesbury Electric & Radio Co.

In the Chancery Division on February 25th, Mr. Justice Astbury had before him an action brought by the plaintiffs against the Shaftesbury Electric & Radio Company, of Little St. Andrew Street, St. Martin's Lane, London, in respect of an alleged infringement of their letters patent in a radio receiving set sold by the defendants. The defendants were not represented and the action was therefore undefended.

Mr. Trevor Watson, for plaintiffs, said that the letters patent were Nos. 13,636 of 1913 and 147,148. The defendants, who had put in a defence, did not deny the plaintiffs' title but they denied infringement and said that the apparatus which they had used was made under certain other letters patent. That, of course, was an entirely irrelevant plea. The rest of the defence was taken up with an allegation by the defendants that they had in fact received a licence from the Marconi company. That was an issue the burden of which was entirely upon the defendants, and unless his Lordship desired to be satisfied on the point, Counsel did not propose to trouble him about it. The Marconi Company said there was no licence and if necessary they could prove it.

Evidence was given by an employé of the Marconi Company of the purchase from the defendants of two sets which contained infringements of the letters patent in question.

Judgment was thereupon given for the plaintiffs for an injunction, an inquiry as to damages and the delivering up of the infringing articles, with costs.

Harwell, Ltd., v. Wood.

The allegation was made in the Shoreditch County Court, on February 23rd, before Judge Cluer, that an attempt had been made to evade payment of a debt by the formation of company succeeding company which disappeared. The plaintiffs are hardware and electrical supplies agents, and they sued Leonard R. Wood, of the Burwood Electrical Supplies Co., 20, Lesbia Road, Hackney, to recover £5 8s. 10d., for goods supplied.

Mr. Samuel, for the plaintiff, stated that when the case was called on the money had been paid into Court, and he was now asking for costs, and the costs of the interrogatories. Judge Cluer said he did not see his way clear to give anything special in the way of interrogatories on a £5 8s. 10d. claim. Mr. Samuel said that it had become necessary to administer these as the defendant had denied owing the money, saying that he was employed by the defendant company, and that the real debtor was a company which had disappeared. All personal liability was denied. It seemed that Wood started a company which subsequently became a limited company, and he said that he had nothing to do with the order. It was an attempt to get off payment by the forming of companies which gradually disappeared. There was a much larger sum involved than that sued for; in fact, the plaintiffs, as agents, were owed over £40; they were making this a test case.

Judge Cluer gave judgment for £5 8s. 10d., and what costs the Registrar allowed.

First Automatic Sub-station in France.—What is said to be the first automatic sub-station in France has, according to the *Electrical World*, recently been installed by the Compagnie Française Thomson-Houston at Sèvres for the Société des Transports en Commun de la Région Parisienne. The equipment comprises three 550-kVA, 13,500/445-volt transformers and two six-phase, 500-kW, 600-volt converters.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Government Electricity Scheme.

Now that Mr. C. C. Hodges has made his figures more clear, it is obvious that my prices of 6d., 2d. and 1d. would show a loss. But I would point out that his present cost of generation is £2,161 per annum—3.29d. per unit; and I, therefore, feel called upon to refute the concluding statement in his first letter in your issue of January 29th: that the Government scheme "must surely operate to the disadvantage of the public." He could still sell electricity at his present prices, while making an even larger profit.

Mr. Hodges states that, even if he could buy in bulk at 3d., he would consider it folly to sell at any price less than 3d. How, then, does he justify his action in generating at 3.29d. per unit and selling at 3d. and 1½d.?

As for the concluding remarks in his present letter, might I ask him to consider the case of a certain world-wide chain of cheap stores. It is a known fact that this organisation sells many articles at a loss, in order that it may recoup itself by the increased sale of those articles which bring in a handsome profit. Surely Mr. Hodges is doing the same: selling some of his electricity at 3d. and 1½d. in order to gain more customers for his 9d. goods!

H. J. Allcock.

Manchester, *February 26th*, 1926.

"Electrical Freedom."

Mr. L. L. Robinson, M.Inst.C.E., again indulges in "a little innocent humour" at the contractors' expense in your issue of February 26th.

The wisest men (one expects wisdom from the Civils) relish a little nonsense now and then. It is too bad, though, to caper at present when a nervous group of condemned contractors are trembling on the brink. They might, disturbed by appreciative cachinnation, precipitate themselves to perdition at once, then Mr. Robinson would be forced to take over what he calls the "worry" of all the electrical sales and service.

The worry apparently consists of controlling an absolute monopoly; producing, installing, hiring, selling, repairing, advising and collecting bills, presumably untramelled by skill, experience, or rules—with the community's money. Why worry?

If it be true that the contractors in his dense area have merely achieved negative selling results in some important electrical lines—results which can only be summed up under the headings "none," "none," "none," "some," "nil," and "very little"—then they may deserve the contempt they get from Mr. L. L. Robinson. But they must be a hardy lot. No wonder he fears to trust his future to them.

He says contractors ought to be "scrambling for my orders." The reason why these undocile varlets are not coming to heel is probably due to the fact that even Hackney has not yet sunk to that dreary dead level where Mr. Robinson's schedule of prices would apply. The schedule might even be a bait to contractors to lead them to cut their own throats. One has to watch these supermen. It would be interesting to see this schedule of prices alongside Mr. Robinson's universal specification. The specification presumably is not found wanting "when the inevitable iron, kettle, vacuum cleaner, or radiator comes along." The specification will probably provide for "cooking" and "water heating," for in these two functions at least a supply engineer is well within his charter.

Mr. Robinson devotes particular attention to vacuum cleaners. Perhaps they are a specially desirable load in his area. I hope those he is now connecting at the approximate rate of 1,404 per annum are British. Vacuum cleaners are too often made where the sales stunts come from, and sold most successfully by calling when the husband is out. The consumer is frequently landed with a short-lived glittering mass product at possibly four times its manufactured cost, or the sum on which import duty is paid. Contractors are not wholly satisfied with the present methods of vacuum cleaner dealing, and would be pleased to have this matter put on a different basis. Then some might seek to emulate Mr. Robinson in whole-hoggishness in Hackney.

There is no doubt that with the capital at the command of the municipalities and the supply companies, and from the satisfactory yields obtained by the sale of energy, they are in an excellent position to help to boost the sales of all current-consuming devices. But the variety and class of electrical appliances are so infinite and varied that the installation and development of these are best dealt with by active, free and independent contractors—each contractor bringing up his group of trained craftsmen and salesmen, and each in open competition with the other, working in a fair field, and this without adding to the number of municipal employés or increasing the rates.

Mr. Robinson's article, stimulating as all his articles are, overflows its text at times, and readers will be sorry to hear of his primitive private plumbing arrangements. These sidelights are illuminating. "To know all is to understand all" as the French say. These personal troubles may be at the bottom of his outburst on the contractors' creed.

The article concludes with the remark that "after all the proof of the pudding is in the eating." Apparently, the author wishes the municipal man to go all out for everything, and so complete the entire consuming circle.

The ideal is reminiscent of the python, which after commencing to swallow his tail, continued and congratulated himself on his increasing girth and his cheap and abundant supply. Paradoxical as it may appear, the python soon came to an end.

Donald Smeaton Munro, M.I.E.E.

Edinburgh, *February 27th*, 1926.

Country House Fires.

In the issue of *The Times* of February 19th, an article appears under the above heading, and also a very timely letter on the subject from Mr. S. G. Castle Russell.

The article referred to gives a list of 19 country houses in which serious outbreaks of fire have occurred since the beginning of 1925, and in 14 of these it is stated that the cause of the outbreak was unknown. In a considerable proportion the fire has originated in the roof, which suggests that either the electrical wiring or the flues may have been at fault.

Mr. Russell, in his letter, points out that in many instances the wiring has been in use for many years and that, in consequence, the rubber insulation has perished. He urges that owners of such houses should satisfy themselves that their electrical installations are not a potential danger.

I can heartily support from my own experience Mr. Russell's statement. Many instances of installations put in 20 or more years ago have come to my notice, where the insulation of the cables has become perfectly brittle, and has developed open cracks. Such conditions are favourable to leakage of current. But, even at the present day, a vast number of houses are being wired in a manner which causes those who are aware of the risk to experience a feeling of alarm.

Happily, recently a Register of Electrical Contractors has been inaugurated, and by the employment of contractors on this Register it is possible to reduce the fire risk to a negligible quantity.

Unfortunately, however, there are a great number of electrical contractors outside the Register who do not adopt the same high standard of wiring, and through the demand for cheapness at any price a great deal of wiring work is carried out which cannot be said to have been done in a safe and proper manner. It is against the risks due to wiring of this description that the public should be protected.

Under the existing Electric Lighting Acts the supply authority is called upon to make a test of the wiring before connection to the public mains, but wiring which has been carried out with inferior material in a careless and inefficient manner will usually pass such an insulation test without difficulty. What is wanted is a system of inspection of the wiring whilst in progress, to ascertain that the material and workmanship are both satisfactory.

I suggest that the fire insurance companies, as the protectors of the public against fire risk, are the most suitable people to take responsibility for systematic inspection of installations, more especially during the progress of the work.

The general public would feel a sense of security if the insurance companies would give a certificate to the effect that an installation had been inspected for materials and workmanship and found satisfactory.

F. J. Moffett, B.A., M.I.E.E.

Birmingham, *February 27th*, 1926.

The Metering of Three-phase Power.

The examples of phase voltages which I gave in my letter of January 25th were extreme conditions, as I pointed out, but Mr. H. H. Jaques, in his letter of February 12th, appears to suggest that they are outside the range of three-phase conditions; this, however, is not the case. The first condition I mentioned, namely, E1 and E2 equal and opposite and E3 zero, would occur if the 3-phase, 4-wire supply were given from the secondary side of a bank of three single-phase transformers connected star/star with a tertiary winding connected in delta, the supply being 3-phase, 3-wire, if one of the transformer primaries became open-circuited. The condition that E1 and E2 were equal and opposite and E3 was zero would not hold for all conditions of loading, but the condition E1 + E2 + E3 = 0 would. The delta-connected tertiary winding takes care of that. The second condition I mentioned, namely, E1 and E2 equal in magnitude, in phase with each other, E3 being 180 degrees different and twice the magnitude of the other voltages, would occur if the 3-phase, 4-wire supply were given from the secondary side of three single-phase transformers connected delta/star, the supply being 3-phase, 3-wire, if one of the supply phases were interrupted. The condition stated will not hold for all conditions of secondary loading, but the condition E1+E2+E3 =0 will; the delta-connected primary winding takes care of this. These delta-connected windings, whether they be tertiary or primary, will always compel any departure from normal voltage conditions, however great or small, to comply with the condition E1 + E2 + E3 =0. In other words, the unequal voltage referred to by Mr. Jaques in his third paragraph is compensated for by a change in phase angle auto-

matically by the nature of the supply circuit, and it is this useful feature of a three-phase supply system that is made use of in a 2-element, 4-wire meter and in other pieces of apparatus.

Now Mr. Jaques will probably say that whilst these conditions may hold at the secondary terminals of the supply transformer, they do not necessarily hold at the end of a cable when the loading is unbalanced, and I shall agree with him that one cannot expect accuracy on a 2-element, 4-wire meter under those condition. The 4-wire metering equipments that I have dealt with have all been on the terminals of the transformer, as most power consumers of sufficient size to require a maximum-demand indicator have been supplied direct from the transformer in their own substation, and I think this is the general practice.

Referring again to the relative interaction errors of 2-element and 3-element meters, I find that the maximum interaction between elements is seven times as great in a 3-element meter as in a similar 2-element meter. Without taking up space with an analysis of errors due to interaction, we may say that registration errors due to interaction will be four times as great in a 3-element meter as in a 2-element meter. This is a factor which meter engineers have to bear in mind when considering the type of meter to be used for a particular job, and in view of the fact that if the supply is delivered at the secondary terminals of the supply transformer we may rely upon E1 + E2 + E3 = 0 (the reasons for which I have outlined above), I prefer to use a 2-element meter in the interests of accuracy.

Tests taken on 2-element meters of the makes commonly used in this country showed the meter in which Mr. Jaques is interested to have least interaction, and perhaps this accounts for his views on this section of the subject under discussion.

A Meter Superintendent.

February 23rd, 1926.

The Testing of Transformers.

Allow me to reply to the letter published by Messrs. Thompson and Walmsley.

It will be noted that in connection with fig. 2 of my article of February 19th, which they take objection to, I described that method as being workable, but not sufficiently accurate.

In their letter, Messrs. Thompson and Walmsley describe a wattmeter whose field coils are wound for 220 volts; such a wattmeter, used in conjunction with a transformer, would I think be subject to some of the errors which I pointed out in connection with fig. 2, though to a lesser degree.

I would like to ask the original authors if there is any objection to connecting the field coils of the wattmeter to the low-pressure side of the transformer under test, thus cutting out the instrument transformer?

D. Pedley, A.M.C.T.

Manchester, *February 27th*, 1926.

The "Electrolux" Refrigerator.

As already mentioned, a demonstration of this refrigerator, of which we gave an illustrated description last week (Electrical Review, page 327), was given on February 23rd, before a large company of public men and Press representatives by Dr. Hele Shaw, F.R.S. The guests were entertained at luncheon at the Savoy Hotel by Major H. A. Wernher, D.S.O., who presided, and delivered a lengthy speech on refrigeration and its importance with reference to food in view of the fact that an Order has been issued by the Minister of Health forbidding the use of various stated chemicals in food as from January, 1927. Major Wernher described the "Electrolux" refrigerator as the only known contrivance which would continuously produce cold without the use of any mechanical parts. He said that the invention was a possible alternative to the use of preservatives, and was within the means of many householders, also of village shops, provision stores, butcher shops, and dairies. The inventors, Messrs. Platen and Munters, were enabled to perfect their invention through the foresight of Mr. Wenner-Gren. Major Wernher said it would be possible to sell the machine at about half the cost of those at present on the market, and a hire-system purchase was also being developed. The owners of the patents were Electrolux, Ltd., of 155, Regent Street, London, W.1, and the whole of the products of that company for the British and Colonial market would in future be manufactured at Leagrave, Luton, by an English company financed by English capital, all of which had been already subscribed.

Following upon the above function, statements appeared in the London daily and financial newspapers respecting the big patent deal that had been made in the U.S.A. by Mr. Wenner-Gren, who is mentioned above. The *Daily Mail* report states that he "has sold the patent rights of a simple domestic refrigerator, invented by two Stockholm University students, for approximately £514,000 in cash, 50 per cent. of the profits from manufacture, and a small royalty on each refrigerator sold."

"It is estimated that within two years factories in the United States will be making 300,000 of the refrigerators a year for home use, Canada, and Cuba

"The two students who made the invention, Platen and Munters, each received £40,000 for the rights. In addition they will draw royalties and have a highly-paid post in the firm of Electrolux, which bought the rights, and of which Mr. Wenner-Gren is president."

The *Financial Times* quotes Mr. Wenner-Gren, who has just gone to Sweden, as saying that on behalf of the Swedish combine, A.B. Electrolux, he had sold the refrigerator patents to the Electrolux Refrigerator Corporation for $2,500,000 cash. In addition, the A.B. Electrolux would receive one-half of the American company's stock, of no par value, and a royalty on each machine sold. The British company had just had its capital increased to £1,000,000, and when the full production and sales organisation had been completed, which would be in about two years' time, the output of refrigerators at the company's works at Luton would be 100,000 per annum.

The patents in connection with the refrigerator would be exploited by three main groups, one with control in Sweden, the second in Great Britain (for this country and the Dominions, except Canada), and the third in the United States.

The Ideal Home Exhibition.—I.

Electrical Features at Olympia.

The tenth Ideal Home Exhibition, organised by the *Daily Mail* was opened at Olympia on Tuesday last; it remains open until March 27th. Although the general scheme of the display remains the same as in previous years, there are a number of innovations likely to prove attractive to the public, and at least one important omission—radio. That is not to say that radio apparatus is entirely absent from the show; this is not the case, but in previous exhibitions, particularly the last two, there has been a special radio apparatus section in which many of the leading makers have participated. This year where radio apparatus is shown it is as a rule merely an incidental indication of the scope of a firm's production. We believe that we are correct in saying that there is only one purely radio firm exhibiting. The British Broadcasting Co., Ltd., is again arranging a series of demonstrations and concerts during the exhibition; and the Marconiphone Co., Ltd., has once more equipped the main hall with ultra-loud-speaker equipment. The British Electrical Development Association, aided by a number of electrical manufacturers, has produced an improved edition of the 1925 Electric House, one of the principal features being a contrast with methods of 50 years ago, as will be seen from the ensuing notes on the exhibit. Messrs. L. G. Hawkins & Co., Ltd., as we have previously reported, have procured the services of two well-known lady demonstrators, Ald. Mrs. Hammer and Mrs. Pearmain, of Hackney, to demonstrate electric cooking upon their stand. There are about two dozen electrical or allied firms participating, all of which, we believe, have taken part in these exhibitions before. The following is a list of these exhibitors:—Belling & Co., S. G. Brown, Ltd., Delco-Light Co., Dowsing Radiant Heat Co., Ltd., Freezone, Ltd., L. G. Hawkins & Co., Ltd., Hotpoint Electric Appliance Co., Ltd., Mechanical Refrigerator Co., Ltd., Francis Polden & Co., Ltd., Rawlplug Co., Ltd., Reliance Telephone Co., Ltd., Sheringham Daylight Co., Standard Telephones & Cables, Ltd., Thorn & Hoddle, Ltd., Beatty Bros., Ltd., British Vacuum Cleaner Co., Ltd., I. Calvete, Ltd., Electric Appliances Co., Ltd., Electrolux, Ltd., Hoover, Ltd., Hurley Machine Co., International Electric Co., Ltd., Singer Sewing Machine Co., Ltd., and Staines Kitchen Equipment Co., Ltd. We hope to publish a description of the principal electrical exhibits in our next issue.

The E.D.A. Exhibit.

The British Electrical Development Association is again playing an important part in the exhibition, and although its exhibit is another "all-electric" house, the arrangement differs considerably from the model home which formed last year's demonstration. The same position has been obtained, and upon the site has been erected an eight-roomed house covering an area of 57 ft. by 35 ft. The rooms are conveniently arranged for inspection, and comprise a modern electric living room, a modern bedroom, bathroom, laundry and kitchen, with an inquiry bureau (a feature of last year's show), and in contrast to these there are an old-fashioned living room and kitchen of the mid-Victorian period. In each of the modern apartments there is a complete range of up-to-date British electrical appliances in actual operation, and the fullest information is available regarding their cost, the method of using them, and their running cost. A special feature of the display is the lighting which has been carried out with the assistance of the E.L.M.A. Lighting Service Bureau. The Association states that the limited space available has obliged it to restrict the exhibits to really practical appliances, and novelties of a "freakish" character have been entirely eliminated. Some brief notes on the equipment of the rooms may be of interest. In the living room there are examples of wired furniture, an invisible heat screen, footstool and mat,

a "Magicoal" fire, a convector, a table fountain, a hot plate, warming plate, kettle and toaster. The illumination of the room is carried out by means of central ivory bowl fittings supplemented by candle fittings, an "Eyerestolite" floor standard, silver bracket fittings and a table lamp. The bedroom is warmed by a radiator with a clock switch and a "Sunray" radiator. At the side of the bed are an electric kettle and milk warmer, there is also an electric bed warmer. The lighting is provided by a "Partridge" type floor standard, assisted by dressing table brackets, bed brackets, a table lamp, and a night light. The principal appliances in the bathroom are a 10-gal. hot-water storage tank and a 5-kW "Santon" geyser. Warmth is provided by a wall-type radiator, while there are also an electrically-heated mirror, gown and towel rails, a shaving pot, &c. There is a central white-enamelled ceiling fitting and a separate light over the mirror. The equipment of the modern laundry is very complete, there being a "Magnet" clothes washer, an electric copper, an "Eco" clothes-drying cabinet, a "Thor" folding type ironer, a water heater, a plate washer, vacuum cleaners, irons, radiators, &c. The illumination is provided by dustproof "Swanlite" fittings and a "Trojanette" fitting and wall bracket. In the kitchen are a "Cosmos" pedestal cooker, a "Hotpoint-Falco" table-type cooker, a refrigerator, a hot-water tank with accelerator, a sewing machine and a number of small appliances; the illumination is similar to that of the laundry. The corridor through which the visitors pass is lit by eleven G.E.C. lip lanterns with a hall lantern at the entrance. In the inquiry bureau an electric typewriter is shown, as well as an eight-day 10-A clock switch, radiators, &c. A bay window in the house contains a dining-room scene illuminated by spot lights and a "Partridge" table type fitting. In a small garden at the entrance of the house are an illuminated orange tree and an electric lawn mower.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 24th, 1926. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Ankacode, No. 454,878, Ancaflex, No. 454,879, and Ankaflex, No. 454,880. Class 8. Electric cables.—Callender's Cable and Construction Co., Ltd.

N. & K. No. 462,257. Class 8. Headphones, loud speakers, and sound boxes for loud speakers.—Neufeldt & Kuhnke, Ravensberg Werk, Kiel. (T. F. Robertson, 43-46, Southampton Buildings, W.C.2.)

Neron (lettering and design). No. 464,780. Class 8. Instruments, apparatus, and parts thereof for use in radio-telegraphy and telephony. No. 464,781. Class 13. Electric lamps (ordinary), lampholders, electrodes, electrical fittings, &c.—Osram Gesellschaft, 11-14, Ehrenbergerstrasse, Berlin. (Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

A B Products (lettering and design). No. 465,223. Class 8. Dry batteries, loud speakers, headphones, and transformers.—G. E. Ambatielo & Co., Ltd., 29, Clerkenwell Road, E.C.1.

Microux ((lettering and design). No. 465,271. Class 8. Instruments and apparatus for use in radio-telegraphy and telephony.—Auguste L. J. Bertrand, 1, Rue de Metz, Paris. (D. Young & Co., 11-12, Southampton Buildings, W.C.2.)

Navalion. No. 466,042. Class 8. Scientific and philosophical instruments and apparatus for useful purposes.—Edward A. Graham, trading as Alfred Graham & Co.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

14,018. "Electrical plug connections." Knowsley Electrical Co., Ltd., and H. J. McCarthy. March 10th, 1925. (246,607.)

18,728. "Machine for pasting accumulator grids and similar skeleton structures." W. Haddon and J. A. Fullilove. August 6th, 1924. (246,882.)

23,334. "Electric heat-treatment of wire strip and the like." H. Alexander and A. Imbery. October 3rd, 1924. (246,891.)

23,349. "Thermionic oscillation generators." C. P. Allinson. October 3rd, 1924. (246,892.)

23,357. "Protective arrangements for alternating-current electric circuits." A. Reyrolle & Co., Ltd., H. W. Clothier, and W. A. A. Burgess. October 3rd, 1924. (246,893.)

25,877. "Space discharge tube systems for electric wave signalling." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). October 30th, 1924. (246,897.)

25,891. "Electrical relays." A. West & Co., Ltd., and R. P. Bossom. October 30th, 1924. (246,898.)

25,976. "Electrical connectors." J. E. Graham. October 31st, 1924. (Cognate application 13,295/25.) (246,899.)

26,155. "Automatic regulating-apparatus for electrical supply systems." J. S. Smyser. November 3rd, 1924. (246,905.)

26,156. "Automatic regulating-apparatus for electrical supply systems." J. S. Smyser. November 3rd, 1924. (246,906.)

26,185. "Apparatus for the conversion of alternating current into high-tension continuous current." Dr. F. Dessauer, Dr. E. Lorenz, and Dr. M. Brenzinger. November 3rd, 1924. (246,909.)

26,245. "Electric ignition devices for cigarettes or the like." A. Low. November 4th, 1924. (246,912.)

26,248. "Quick-make and quick-break electrical switches." J. B. Tucker. November 4th, 1924. (246,913.)

26,287. "Radio-receiving instruments." W. H. Hunt. November 4th, 1924. (246,914.)

26,398. "Keyboard telegraph transmitters." C. F. Hilton. November 5th, 1924. (246,919.)

26,471. "Loud speakers for use with wireless receiving sets." R. W. Edmonds and Webb's Crystal Glass Co., Ltd. November 6th, 1924. (246,923.)

26,539. "High-frequency electric signalling systems." British Thomson-Houston Co., Ltd. November 6th, 1923. (224,543.)

26,540. "Electron discharge devices." British Thomson-Houston Co., Ltd. November 6th, 1923. (Patent of addition not granted.) (224,544.)

26,696. "Electric fuses." A. Reyrolle & Co., Ltd., and F. Coates. November 8th, 1924. (246,928.)

26,700. "Transformers for electric arc welding." E. Schroder. November 8th, 1924. (246,929.)

27,699. "Vapour-electric rectifying apparatus." J. L. Rowbotham and Hewittic Electric Co., Ltd. November 19th, 1924. (246,943.)

27,716. "Electrical resistances." H. R. G. Moore and J. B. Swan. November 19th, 1924. (246,944.)

28,745. "Insulating holders for inductance and like electric coils." J. Pacy and Comton Wireless Manufacturing Co. December 1st, 1924. (246,952.)

28,870. "Electrical connections or couplings." S. D. McKellen. December 2nd, 1924. (246,953.)

29,357. "Protective device for dynamo-electric generators." Siemens-Schuckertwerke Ges. December 8th, 1923. (225,878.)

29,527. "Sound amplifiers." A. H. Haag. December 9th, 1924. (246,962.)

29,544. "Method and means for measuring electrical quantities." Siemens Bros. & Co., Ltd., and W. H. Grinsted. December 9th, 1924. (246,963.)

30,207. "Thermostatic electric circuit-breakers." G. Wilkinson. December 16th, 1924. (246,969.)

30,699. "Electric insect-traps." D. Fillier. December 20th, 1924. (246,974.)

30,980. "Terminals of electric dry batteries." C. E. Cleminson. December 24th, 1924. (246,977.)

1925.

376. "Inductance coils." H. A. A. Brosse. August 18th, 1925. (246,980.)

520. "Electric lamps for motor road vehicles." J. Y. Fletcher and T. J. Sack. January 7th, 1925. (246,985.)

540. "Electric lamp signalling device." J. Jones and D. Walters. July 6th, 1925. (246,986.)

808. "Illumination of identification-plates for motor vehicles." J. Lucas, Ltd., and O. Lucas. January 10th, 1925. (246,991.)

1,874. "Electric current-transforming means." British Thomson-Houston Co., Ltd., and H. S. Petch. January 21st, 1925. (246,995.)

1,881. "Rectifying systems for polyphase alternating electric currents." N. R. Davis and Metropolitan-Vickers Electrical Co., Ltd. January 21st, 1925. (246,996.)

2,430. "Dry cells." Mannesmann-Motoren Werke. September 17th, 1924. (240,118.)

2,973. "Driving of rapidly rotating parts by electric motors." Siemens Schuckertwerke Ges., W. Peineke and O. Jahnert. February 2nd, 1925. (247,004.)

3,733. "Terminals for electric conductors used in wireless and other apparatus." E. A. Wood. February 10th, 1925. (247,013.)

4,002. "Electrically-operated shutters." A. Muhlstock. February 12th, 1924. (229,322.)

4,065. "Alternating-current induction motor." F. Krupp Akt. Ges. March 13th, 1924. (230,804.)

6,474. "Dirigible headlights for motor road vehicles." A. V. Beardsley and G. M. Elston. March 10th, 1925. (247,026.)

6,514. "Electron discharge tubes." V. F. Feeny (Magnavox Co.). March 10th, 1925. (247,027.)

10,780. "Multi-core electric cables." A. W. Williams. April 25th, 1925. (Addition to 217,002.) (247,040.)

15,399. "Electric control systems." British Thomson-Houston Co., Ltd. September 15th, 1924. (239,830.)

15,869. "Means for regulating the voltage of dynamos of variable speed and load." Eclairage des Vehicules sur Rail. September 20th, 1924. (240,128.)

16,114. "Electric discharge devices." Westinghouse Lamp Co. July 9th, 1924. (236,915.)

17,094. "Device for actuating double contacts for illuminated advertisement apparatus." N. E. Pedersen. July 3rd, 1925. (247,073.)

17,231. "Electric control systems." British Thomson-Houston Co., Ltd., and C. J. Sarjeant. July 4th, 1925. (247,075.)

17,346. "Electrical transformers." Naamlooze Vennootschap Philips Gloeilampenfabrieken. August 10th, 1923. (Divided application on 220,314.) (236,593.)

19,455. "Electric control means for reproducing position." British Thomson-Houston Co., Ltd. (General Electric Co.). July 31st, 1925. (247,087.)

20,220. "Tuning-apparatus for the elimination of undesirable magnetic coupling in high-frequency electric circuits." Haseltine Corporation. April 7th, 1924. (Divided application on 231,820.) (238,256.)

20,235. "Devices for transferring thermo-electric power effects to the skin." Dr. W. Graefe. August 12th, 1925. (247,095.)

21,387. "Re-setting device for the controllers of, particularly, one-man-operated electric vehicles with electric braking means." Maschinenfabrik Oerlikon and B. Storsand. August 26th, 1925. (247,099.)

21,506. "Electrical railway signalling devices." Siemens & Halske Akt. Ges. July 1st, 1925. (247,100.)

24,919. "Electric rail switch responding only to trains running in one direction." J. Kremenezky (firm of) and L. Wimberger. October 11th, 1924. (241,197.)

26,376. "Controllers for electric trains." Akt. Ges, Brown, Boveri et Cie. October 30th, 1924. (242,265.)

32,088. "Wireless signalling." N. Koomans. August 19th, 1925. (247,128.)

32,825. "Method of and means for operating mechanically-driven rectifiers in connection with electric transformers." Lodge-Cottrell, Ltd. (Lurgi Apparatebau Ges.). February 25th, 1925. (Divided application on 230,073.) (247,131.)

Electricity Supply in Leipzig.—The *Electrical World* says the consumption of electrical energy in the city of Leipzig is estimated to have increased sevenfold since 1914, and the growth of consumption has been especially rapid since the stabilisation of the German currency. From 1923 to 1924 it increased 100 per cent., and a further increase of 50 per cent. was shown from 1924 to 1925. The city electricity undertaking is at present installing about 2,000 new meters every month for domestic lighting. The construction of new generating plant has been handicapped by lack of funds and also by the delays in delivery of electrical machinery by German manufacturers, who are said to be overwhelmed with more orders than they can fill. Leipzig obtains the greater part of its electrical energy from the large power plant of Luchornewitz, in Prussia, which also supplies Berlin, Magdeburg and Lauterberg. This plant, which is also handicapped by delays in delivery of new machinery, is unable to increase the amount of energy supplied to Leipzig. It is expected that a shortage will be seriously felt in Leipzig unless the production capacity of the local plants is increased. Owing to its financial situation Leipzig will be unable to carry out the necessary construction unless a loan is floated, and it is doubtful whether such a loan can be obtained on favourable terms for some time to come.

The

Electrical Review

VOL. XCVIII. MARCH 12, 1926. No. 2,520.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Freedom for Supply Development.

THE cry of the moment is for a great development of the uses of electricity for all purposes.

This cry is not uttered because the electrical industry is in a bad way and needs national assistance, but because we are behind other peoples, and because electricity and efficiency have become practically synonymous in both the industrial and the domestic fields.

Increased facilities for cheap production and wider spread distribution if they follow the work of changed organisation and control will naturally be expected to add to the volume of our electrical manufacturing and trade, but that is not the prime concern either of the Government or of others who are engaged in current discussions and investigations.

The main concern of all should be to secure a more generous use of electricity by the population of the United Kingdom for all those purposes and with all those beneficial results which are so well understood by readers of the ELECTRICAL REVIEW that they need not be recapitulated now.

It is well that we should not permit this one great necessity to be lost sight of because sectional discussions are in progress, nor obscured by exaggerated views of possible ill-effects of any movement helping towards the realisation of our desideratum.

Apart altogether from current legislative proposals for promoting advance, and from the fact that various projects have been suspended awaiting detailed particulars of the nature of such legislation, it is common electrical knowledge that in many parts of the country only the mildest sort of efforts are being made to secure the great flood of business that is awaiting us. Stated briefly, there are many thousands of people who would be using electricity, or using more of it, if we could make the way easy for them to get it. Simplification and accommodation are two comprehensive words which express the need from the standpoint of the general public. But we shall not secure these essentials unless we first take the largest possible view of our responsibilities. The community does not exist for the benefit of any section or sections, and sections can only justify their existence in so far as they meet the needs of the community satisfactorily.

Electricity supply authorities—it matters not whether they are municipalities or companies—have no right to allow their undertakings to operate for the benefit of

the few, and they are not fulfilling their responsibilities if they fail to exercise the powers that they already possess for enabling them to give a supply of electricity at reasonable rates to everybody within the area over which they have been granted control. In the present day we have as hard words to use for authorities which either deliberately or apathetically fail to exercise their powers as we ever had for little local authorities which deliberately obtained provisional orders and sat down doing nothing or just trifling with electricity supply, in order to keep more enterprising parties from coming on to the ground. There are unquestionably listlessness and unwillingness among both some companies and some municipalities.

We are able to single out, from time to time, various places in which electrical development is occurring at a most remarkable rate, but there are many where only the fringe of the possibilities has been touched, and this is not due to any need for new legislative action. It is due to failure to recognise the need for exercising to the full responsibilities which should inevitably be considered as the accompaniment of authority granted by the Government.

The foregoing are not new sentiments in the editorial policy of the Electrical Review, nor are they new in the minds of a large number of leading men who want electricity rapidly to advance into the by-ways of our common life. We reiterate them now, however, because it may be found that they have some bearing upon the principal subject discussed in our "Correspondence" columns this week.

Mr. L. L. Robinson seems to have put the fat in the fire by daring to state the other side of the case after reading the Electrical Contractors' pamphlet on "Electrical Freedom." He is occasioning mirth, because he and his authority are working hard to place electricity and electrical service within easy reach of the general body of ratepayers of his borough. His *confrères* recognise that he is succeeding in doing so, and some of them look on with envious eyes. He holds that it is no nearer to Bolshevism or Socialism to give electrical service than it is to give electrical supply, when the private contracting service of his area is less able than his own organisation to secure the popularisation of electricity.

Surely it is the duty of the industry as a whole to do its utmost to increase the uses and sale of electricity. By so doing we shall increase the demand for all classes of electrical manufactures. The more difficult it is made for the consumer, the slower will be the rate of advance and the smaller will be the output of the industry.

The New Electricity Bill.

Three years have passed since the last general Electricity Act, and now a new one is in prospect. These "general" Acts are the ones wherein to get relief from "shoe-pinches." No doubt a few such points have accumulated, which ought to be included in the new Act. There is certainly one outstanding trouble which should be drastically dealt with, namely, that of obtaining definite rights of way for rural mains. Every year the lack of adequate powers to secure wayleaves grows more irksome, and it is high time that the impediments were removed. One has only to note the character of a good proportion of the Special Orders for distributing powers taken out during the last year or so to see the big extensions that are contemplated. The difficulties over wayleaves mean, at the least, a deplorable waste of time, and frequently they result in a definite handicapping of the whole scheme. If the new Bill is to carry out its object of securing a supply in the districts hitherto uncatered-for, an indispensable provision must be that of giving the fullest powers as regards rights of way to the existing distributors. The associations representing the industry should see that if the Bill does not provide fully for this, the necessary amendments are put forward at an appropriate time. This is a matter in which the industry is united, and which interests many municipal undertakings in view of the big new areas for which certain urban local authorities have obtained Orders. What is everybody's business is often nobody's, and if this opportunity is lost, the present state of affairs may drag on for another term of years. The existing undertakings should certainly insist that every possible facility for extending their distribution systems shall be incorporated in the Bill. Consumers, or rather prospective consumers, too, are interested in seeing that this is done; otherwise, despite all the talk of electricity for everybody, they may be left out in the cold.

Electricity in Agriculture.

The paper read before the Institution of Electrical Engineers last week by Mr. R. Borlase Matthews attracted a large attendance of members, who always show their appreciation of "the pictures"; and certainly the films and other illustrations shown by the author were of exceptional interest and novelty, bringing home to the spectators the fact, amongst others, that electric ploughs are at work which can turn six furrows simultaneously at four miles an hour—over an acre per hour. Too much importance cannot well be attached to this subject, for it is to such heavy work as ploughing that we must look for the load that makes rural electricity supply a profitable undertaking, not only to the farmer, but also to the supply authority. When one quarter of the area is arable land, says the author, experience shows that the supply is remunerative even without ploughing by electricity; and the potential demand is enormous—the United States Department of Agriculture estimates that agriculture uses "as much primary power as all manufacturing and central-station plants combined." Over 500 British farmers are using electricity; but Mr. Matthews says that nearly a million farmers in other countries are employing it, and the remarkable statement is made that from 75 to 90 per cent. of the output of the Continental motor manufacturers is now of the agricultural type, which is often used also in factories.

The occasion was noteworthy, in view of recent correspondence in our columns, for the fact that the feeling of the meeting was taken by the President, and it was decided to continue the discussion on Thursday this week, thus meeting the criticism that too little time is available for the adequate discussion of an important subject. This is a reversion to a practice frequently followed by the Institution in by-gone days, with great advantage to all parties.

Gas and Electricity.

Of all the untenable claims that are made on behalf of the gas industry, there is, we think, none more inaccurate—to use the mildest expression—than the allegation that whilst electrical engineers obtain from coal only 20 per cent. of the heat energy that it contains, gas engineers get 80 per cent. The statement appears in various forms. At the recent meeting of the South Metropolitan Gas Co., Dr. Charles Carpenter, in the chair, said that "we *account for* from 97 to 98 per cent. of the energy of the coal, and of this nearly 80 per cent. is *passed on* to the consumer in one form or another" (our italics). These expressions are perfectly true if taken literally, but convey an utterly false impression to the casual non-technical reader and the lay journalist. What boots it to "account for" 98 per cent. of the heat, when the "account" includes losses amounting to 20 per cent.? and whilst it is true that "nearly 80 per cent. is *passed on* to the consumer," how much does he get out of it? Seldom more than half as much as the gas engineer takes credit for, and often much less than that. On the other hand, electrical energy delivered to the consumer is in the most suitable form for complete utilisation with negligible loss. At the meeting of the Gas Light and Coke Co. last month Mr. D. Milne Watson made a similar statement, to the effect that 80 per cent. of the heat value of coal was "recovered" in the production of gas, so that substitution of electricity for gas for heating and cooking would involve the consumption of three or four times the quantity of coal. Mr. H. Woodall at a similar meeting said

0 per cent. of the heat was "recovered." We have no bjection to a reasonable degree of optimism, but exggeration of this order is intolerable.

It is amusing to observe that the prevailing policy f placing the electrical generating station as far as ossible from the place of consumption and reducing the ost of energy by transmitting it at high pressure, seems o have spread to the gas industry. The inventor of a rocess of low-temperature distillation, Mr. Harald Nielsen, has suggested that the price of gas could in most owns be halved by supplying the gas in bulk by longistance transmission, tapping the main *en route* to erve the intervening districts.

German Confidence in the Future.

It is stated that when addressing the shareholders of the A.E.G., at the annual meeting held on February 26th, Herr Deutsch said that the directors regarded the future prospects of the electrical industry with extraordinary confidence, as the work of the electrification of the world was progressing at an accelerated rate and the consumption of energy in Germany was far behind that of other countries. Big problems therefore remained for the near future. On the whole, business transactions in Germany had changed owing to the scarcity of working capital and the general depression. Whereas formerly about one half of the company's total turnover was composed of large industrial contracts, such large orders were now entirely lacking, and the turnover was represented by a considerable number of smaller installations and of apparatus and materials which naturally required larger personnel and expenses. There was no doubt that the improvement in the economic situation and the stabilisation of the French franc and the Italian lira would afford an opportunity to the heavy industries to modernise their plants and to place orders for new installations. Herr Deutsch proceeded to express the belief that in the development of the next decade it would be seen that different countries would perceive that capital, labour and experience, and finally technical talent, would only be available to them in a limited measure; and that, according to the existence of mineral resources and the character and composition of their national economic forces, they would have to restrict themselves to the manufacture of normal products in their respective countries and obtain from abroad highly finished manufactures such as machine tools, special machines, and low- and high-pressure plant. Under the circumstances, said Herr Deutsch, the Germans must systematically advocate a reversal of the system of high protection in all countries in order that rational and systematic distribution and production might provide the basis for a new economic development of the European continent.

The Future of London Transport.

The annual reports of companies interested in electric tramways, and the deficit on the working of the London County Council system during the past year, have again brought into prominence the serious position and worse prospects with which certain undertakings are confronted. Adopting a superficial view, some of the critics allege that the tramway is obsolete, and must give place to the motor omnibus; but those who attach due weight to the considerations involved are by no means of that opinion. For one thing, some provincial tramway undertakings, although offering cheap fares, are showing very satisfactory returns, and their owners are so confident as to their future that in some cases they are expending large sums on renewals and extensions; of these the critics make no mention. Again, the Ministry of Transport, which through its Advisory Committee has made a thorough study of the subject, emphatically states that the tramways are indispensable to transport in London, and will by no means be abandoned. Lord Ashfield, who is at the head of companies operating electric railways and tramways, and motor omnibuses too, whilst deploring the unhappy state of the London transport undertakings as a whole, last week expressed his conviction that tramways should play no small part in the scheme, and could be made more popular. His remedy for the existing troubles was co-ordination of all the agencies employed in London traffic on a stable and satisfactory basis, involving common management and the pooling of receipts, and he expressed the willingness of his companies to enter into negotiations with that end in view. The London Traffic Act of 1924 empowered the Minister of Transport to restrict the number of omnibuses on routes where alternative services were provided, for the express purpose of protecting the tramways from excessive competition, and the Ministry is actually preparing schemes for specified routes.

It should not be forgotten, in all these cases, that tramways carry statutory burdens from which their competitors are exempt—namely, the paving of the roadway, and the transport of workmen at unremunerative fares; the former is a compulsory subsidy to the rates, the latter to a particular class of passenger, and neither can be justified on economic grounds. Also, in London, the tramways are heavily handicapped by their exclusion from the main thoroughfares running east and west and by the absence of adequate connections crossing central London, whilst the omnibuses are free from these restrictions.

With regard to the underground and surface railways, the enormous improvements which have been carried out since the war and are still in progress can hardly be fully realised by those who are constantly using them. Not only are the electrified portions being continually extended to the remoter suburbs, but also in the central area numerous changes have been made which, to one revisiting London after some years' absence, might convey the impression that a new system of railways had been installed. These changes are bound to attract more traffic, which, with the incessant increase in the travelling public, the development of suburban housing schemes and the anticipated revival of trade, may confidently be expected to place the railways in a more satisfactory position. Similar considerations apply to the tramway undertakings, which, we hope, have reached the limit of depression and will soon experience better times.

The National Scheme and Unit Cost.

The extent to which the enthusiasm of the modern electricity supply undertaking's staff, in getting its unit-cost figure down as low as, or lower than, that of other undertakings of similar capacity and output, is responsible for the excellence of the results obtained is probably not realised by many authorities. This was an opinion expressed recently by the chief engineer of a large modern undertaking, and it raises the question what effect the Electricity (National Development) Bill will have on this spirit. It is beyond all doubt that a lively *esprit-de-corps* between the staffs, controlling, administrative, or working, of electricity concerns, indeed in any phase of industry, is a healthy feeling which should be encouraged and cultivated by all means compatible with efficiency and economy. Under the Bill it is understood that the unit cost and load factor will be figures more or less common to all undertakings and districts, and the possibility under such conditions of the keenness of the staff engineer to outdo his rival being weakened to some extent is not remote. One thing is certain—the chief would lose a strong argument if he were not able to put before his staff the figures of other undertakings as a goal to reach or a score to beat. That the station engineer would deliberately slacken his efforts as a result of the pooling of the energy generated, is incredible; but the psychological effects of a desire to go one better are far-reaching, particularly in a nation of sportsmen. We hope that any tendency towards the damping of enthusiasm from the cause indicated will be counteracted by measures designed to maintain the keenness which is vital to progress and economy.

Electricity Supply Showrooms.

Some Recent Developments.

It is satisfactory to note that progress continues to be made by many electricity undertakings in the policy of establishing and maintaining efficient up-to-date showrooms, and some recent visits to showrooms have enabled us to see some new lines of development under varying conditions. Practically speaking, nowadays all showrooms devoted to the exhibition and demonstration of the uses of electricity and electrical appliances are designed and laid out to meet the conditions pertaining to the lives of the bulk of the people to be catered for—the middle classes. Undertakings generally have grasped the necessity of creating the correct atmosphere in their showrooms by furnishing and equipping the various departments to represent the places—domestic or industrial—where the electricity would normally be consumed. Broadly speaking, this necessity only applies to the use of electrical energy in the home, and involves the representation of the usual rooms of the normal household. In this respect it is worth while noting the improvement made to the "atmosphere" when the demonstration room in question is actually a room of normal structure and dimensions. The partly constructed room, with one side open, leaves much to be desired in the direction of making the prospective customer or consumer feel at home, although it is a big advance on what was only a few years ago the usual practice. Probably the emphasised "on-show" effect of the partly completed display room is particularly stressed where the room opens out on some attractive part of the premises such as the reception hall. Where it is deemed necessary to equip the main premises luxuriously, it seems advisable to keep the display rooms, where they are designed to create a desired "atmosphere," shadowed from the outside splendour; after all, the effect must be greatest when the customer is actually in the room with the door shut, whatever is inside or out.

It is interesting to learn of one case where a special lighting-demonstration room, with no windows, is set apart for that particular work. It is always a difficult problem to demonstrate artificial lighting during the daytime, and the difficulty increases with the modern tendency to introduce scenic window effects into the display rooms. Increased attention is being given to the important question of showroom management, particularly as regards the personality and behaviour of the staff. It would not be difficult, we imagine, in an elaborate modern showroom, for the good effects produced or which would have been produced to be destroyed by a want of affability on the part of the staff, brought about, perhaps, by a too stringent control. How far the good results referred to in the description of the North Metropolitan showrooms at Southgate are due to the policy adopted in the management of the staff, it would not be easy to define, but the fact remains that excellent business has resulted since the showrooms have been established. Comparisons cannot, of course, be definitely made between different showrooms and the policies adopted because of the differing controlling circumstances. The Croydon undertaking, for instance, is interested directly only in the supply of electrical energy, whereas with the North Metropolitan Co. the sales of apparatus and general installation work form an important feature in the business of the undertaking.

Fig. 1.—Reception Hall and Showroom, Croydon.

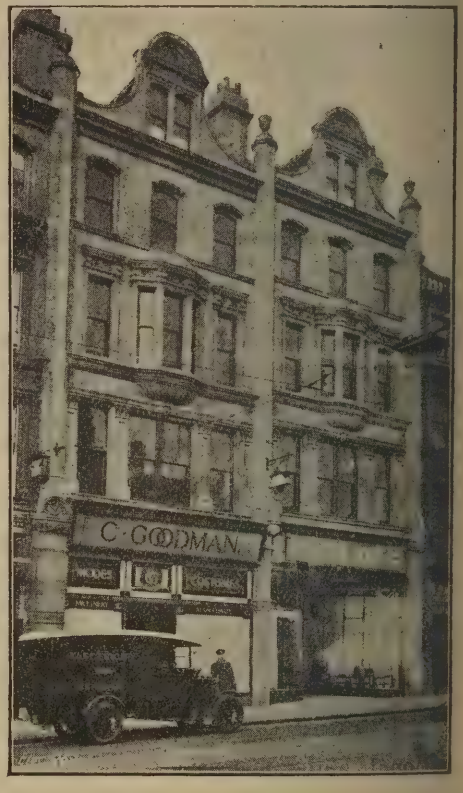

Fig. 2.—Electric House.

The New Showrooms at Croydon.

Electric House, fig. 2, which was opened recently by the Mayor of Croydon, Councillor A. J. Camden Field, J.P., is situated in the main thoroughfare of Croydon, High Street, and comprises what were, before the reconstruction, four separate premises, 38 and 40, High Street, and two shops in Surrey Street, on to which the new premises now back. The premises occupy seven floors, two of which are below the High Street level and have been allotted to business-development purposes. The principal feature of this department, and probably of the whole concern, is an all-electric flat. This comprises the usual reception rooms, bedrooms, kitchen and bathrooms, and is equipped and furnished to represent an average middle-class dwelling. The rooms of the flat, "Restholm," are complete in every respect, and of normal dimensions. Another important

art of the basement is the all-electric demonstration itchen. This is equipped with several models of elec-ic cookers and other domestic apparatus, which are ired out by the Electricity Department, and it is in-eresting to note that on the occasion of the opening inction the cookers were all in commission, and the llowing items were cooked: 250 scones, 50 small cakes, 0 Shrewsbury biscuits, 3 dozen eclairs, 2 dozen sausage olls, 1 fruit pie, and a Madeira cake.

An industrial exhibition room is another important eature of this part of the showrooms, and is equipped ith all manner of industrial apparatus positioned and

Fig. 3.—Electricity House, Southgate.

onnected so as to render it possible to hold demon-rations under, as near as possible, working conditions.

The ground floor is devoted to the main reception all, fig. 1, at the back of which is a large domestic-ppliances department, and a demonstration and ecture hall. In the reception hall, which is very rtistically decorated and furnished, the consumers' ccounts are paid. Very effective electric-fire settings f panelled marble are introduced in this, as well as n other rooms in the building. The domestic-appli-nces room is equipped with a representative display f most of the makes of electric-lighting equipment. pecial plug sockets are fixed in the walls to accommo-ate brackets already wired and fitted with plugs and rip devices so that different brackets can be shown in ny position by simply withdrawing one bracket and in-erting another in its place. The lecture hall is pro-ided with a suitable demonstration platform. The pper floors are devoted to the commercial and financial erical staffs and the management, and also the care-aker's quarters on the top floor; the last mentioned in-udes an all-electric kitchen. A room is set aside as a brary or technical-journal room; this is intended for embers of the staff who are encouraged to make use of he room, and thus keep in touch with the latest develop-ents. With the exception of about three large fires in he largest rooms, the offices are heated throughout by lectricity. Electric water heaters, with thermostatic egulation, are installed in the lavatories. A feature orthy of note is that most of the rooms and offices are quipped with different electric-lighting apparatus re-resenting the modern makes of equipment and methods f lighting. The display windows occupy one half of he building frontage, the other half being let out for he time being. The windows are equipped for colour-nd spot-lighting schemes, and one window is set apart or feature displays and demonstrations in which the ocal tradesmen will be encouraged to take part.

In conclusion, our thanks are due to Mr. Alex. C. ramb, M.I.E.E., the chief engineer and manager, to hom we are indebted for the above particulars and is courtesy in showing us round the premises.

Three of the North Metropolitan Co.'s Showrooms.

The three most recently opened showrooms of the orth Metropolitan Electric Power Supply Co. are those t Southgate, Chingford and Harpenden. These form a particularly interesting combination in that the first named represents a fairly large and densely populated partly industrial area, while the other places are almost purely residential and rural; Harpenden in fact is still an old English village. The showroms at Southgate, which were opened in August last, are favourably situated at Palmers Green, with the front of the premises nearly facing the direction of the busy road. Electricity House, fig. 3, is a three-storey building laid out on modern lines. The ground floor accommodates the actual show and demonstration rooms, workshops and stores, and the first floor is devoted to the necessary offices. The top floor is arranged in two flats, occupied by members of the staff. The showroom proper, fig. 4, and reception hall occupy the front of the premises, and is served by two large display and demonstration windows. The room is very attractively laid out, and is designed to afford a welcome to all who enter. A feature of the equipment is a glass shade-demonstration cabinet, in which all manner of shades are placed over fixed lamps on shelves. Particular attention is given to the question of dealing with consumers during the payment of accounts. A small electric cash lift, designed by Mr. C. J. Barnett, A.M.I.E.E., the resident engineer at Southgate, serves the show room and the general office immediately above, and the attendant receives the cash and sends it upstairs where it is dealt with, leaving the attendant free to give his whole attention to the client, thus avoiding the unsatisfactory position which results from the showroom clerk attempting to answer inquiries during the necessary booking of the account. A small room is equipped as a special lighting-demonstration room, being without windows of any description, and another room is set apart and fitted up as an all-electric kitchen, fig. 5, where almost any electrical domestic demonstration can be given at any time. Experience has shown that this system has proved more successful than that when the demonstrations

Fig. 4.—The Showroom Proper.

are held in full view of the street, ladies preferring, when attending cooking demonstrations or examining cookers, to be as private as possible. To avoid the staff and workmen, other than those actually employed in the showroom, passing through that part of the premises, separate entrances for the office and engineering staffs and the workpeople are provided. Every effort is made to ensure a happy relationship between the members of the showroom staff, and regulations which may possibly cause irritation are strictly avoided. In passing, it is interesting to note that an

album, filled with excellent testimonials, is suitably placed in the reception hall for the inspection of all interested.

To gain an air of prosperity is the aim of the department, and it is encouraging to know that since the establishment of the new district headquarters, the installation work done by the department has been doubled. The Southgate district was taken over by the Supply Co. in 1911, and the number of consumers now connected to the area network is over 5,000. Special periodical displays are given in the demonstration window, usually

Fig. 5.—All-Electric Kitchen, Southgate.

fortnightly, and the local tradesmen are invited to take part in these.

In contrast to the showrooms at Southgate, those at Chingford are designed to serve a comparatively small area, the number of consumers being at present about 600. The supply to the Chingford area was inaugurated in November, 1923, although the showrooms referred to, fig. 6, were not opened until December of the next year. The premises accommodate the show and demonstration rooms and the offices on the ground floor. The showroom proper occupies the whole of the front of the building, and is equipped with a representative display of the most modern domestic, lighting and heating apparatus of the well-known makers. As at Southgate, arrangements are made with the local tradesmen for special periodical displays in one window set aside for that purpose. A similar demonstration room to that at Southgate is equipped as an all-electric kitchen; this occupies a portion of the rear of the premises, the offices occupying the other part. An outhouse at the back of the building serves as a store, and a sub-station acts as the main receiving and distribution point. This accommodates two 150-kVA, 11,000/415-V, and one 100-kVA, 11,000/3,000-V transformers. The supply is received from the Brimsdown station by overhead line as far as the outskirts of the town, the transmission being continued by underground cables.

The supply and showrooms at Harpenden village are of unusual interest; the area is quite rural, and the undertaking may be regarded as experimental by outside engineers, although it is quite a practical and commercial proposition of the North Metropolitan Company. The area was taken over nearly three years ago, the showrooms being established a few months later, and at the time of our visit 343 consumers were connected to the mains. The premises, fig. 7, constituting the display rooms and offices, is a one-storey building which has been converted from an old wine store. It is arranged on practically the same lines as the premises at Chingford, and is very tastefully furnished and decorated. It is interesting to know that considerable success has been achieved in getting the rural tradesmen to take part in the special window-display work. The windows are equipped with the necessary apparatus for the demonstration of lighting schemes of all descriptions. A feature of the equipment is a lamp-demonstration board designed for comparing various types of electric lamps.

The chief interest in the Harpenden undertaking lies in the fact that the inhabitants of the district are on the whole enthusiastic over the electricity supply, and take advantage of the demonstration and display work of the department. It is encouraging to note that ten cookers are at present installed on the mains, and that the prospects of increase in this direction are good. The main sub-station for the area is located at the back of the premises, and it is connected both to St. Albans and Luton through a 20,000-V cable.

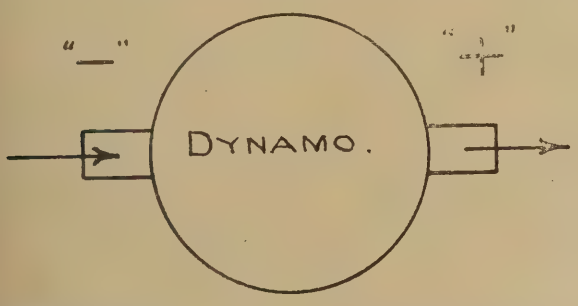
Generally speaking, in districts such as Chingford and Harpenden the company does not establish the showrooms at the same time that the area is taken over. It is considered advisable to wait until some advance with the supply has been made, when the management is the better able to estimate the value a showroom would have in the area.

In each of the North Metropolitan Supply Company's showrooms referred to, the second, or non-feature, window is laid out, in accordance with a general policy adopted by the company, as a "vista" window. This gives a view from the outside right through to the far end of the showroom. This arrangement, when the fittings suspended from the ceiling inside are illuminated, results in a very attractive effect, but it does not lend itself to variation to any great extent. The feature or demonstration window differs from this in that it is provided with a back and has a limited depth. A special department under the supervision of a lady superintendent, Mrs. Walker, arranges periodical feature displays at different times at the branches, one display being removed from one district to replace another elsewhere, and so on.

Fig. 6.—Chingford Showroom.

Fig. 7.—The Harpenden Premises.

In conclusion, our thanks are due to Capt. J. M. Donaldson, M.C., M.I.E.E., the chief engineer of the company, for his permission to inspect the showrooms referred to, and to Messrs. Barnett, Wood and Le Feuvre, the resident engineers of the Southgate, Chingford and Harpenden districts respectively, for their courtesy in showing us round their premises.



Further Notes on Commutation Problems.

By FREDERICK MURGATROYD, B.Sc.Tech., A.M.I.E.E.

Various aspects of the subject of commutation and brush selection in electrical machinery have been discussed in previous contributions by the writer.* This subject, on the surface so apparently simple, is underneath full of intricate considerations, and it is proposed in the present article to discuss a few more of these problems, namely, copper-picking, the heating of commutators, brush thickness and the fundamentals of brush selection.

Copper-picking.

This phenomenon, though not very common, can be very troublesome and baffling when it does occur. It consists of a deposition of copper particles on the contact surface of the brush, but takes place only where the current flow is from copper to carbon. Once copper-picking begins, the effect is cumulative, until in the more extreme cases the phenomenon known as "soft copper" occurs, when copper dust is thrown off from the brush contact surface and collects on the adjacent parts of the machine. The main differences between the positive and negative brushes of a dynamo are shown in fig. 1, and it will be noted that the brush which is liable

Fig. 1.—Comparison of Positive and Negative Brush Phenomena.

to display copper-picking is also the one liable to wear more quickly and has a lower contact drop. It is obvious that the direction of current flow is primarily responsible for these results, but with regard to copper-picking the current flow from copper to carbon can only be regarded as facilitating some secondary cause. What this secondary cause is has never been established. The action may be in some way related to the presence of occluded gases in the copper and carbon, or may be in part a metallurgical phenomenon. The cause is certainly not purely physical, since it ceases when the current flow is reduced to zero. In the opinion of the writer, copper-picking is due to the presence of a combination of conditions of which minute sparking under the brush is the chief.

It may sometimes be observed that copper-picking has taken place on both positive and negative brushes. This result is to be attributed to the presence of circulating currents in the brushes so that in the case of the brush where the normal flow is from carbon to copper, part of the brush surface has a flow in the opposite direction. The degree of copper-picking is proportional to the current density in the brush and inversely proportional to the intimacy of contact. In fact, the first means of cure is good contact, whereby the minute sparking above mentioned is reduced.

To summarise, the cure for copper-picking is to be found in good contact, low current density, elimination of circulating currents, recessed mica and the use of interpoles. If the mica cannot be recessed, then an abrasive brush should be used.

The Heating of Commutators and Slip-Rings.

The temperature rise of a commutator or slip-ring is some function of the peripheral speed and of the watts to be dissipated for every sq. cm. of the commutator or ring surface, and may be expressed mathematically as follows:—

$$T = K \times W/[S \times (1 + 0.1v)]$$

where T = temperature rise in degrees centigrade
W = losses to be dissipated in watts
S = surface in sq. cm.
v = peripheral speed of the rotating surface in metres per second
K = a constant.

For the constant K, the figures of 100 for slip-rings and 150 for commutators have been proposed.

The above formula is, however, somewhat cumbrous, and the following procedure is proposed. It has been found not only practical, but to be as nearly infallible as an empirical method can be.

Let us for the moment assume that the temperature rise and peripheral speed are always constant. We can then omit T and v and the formula becomes—$K_1 = S/W$.

Now the losses W are proportional to the brush characteristics and to the machine current. If we eliminate the brush characteristics we have—$\delta = S/A$, where A is the machine current.

The factor δ is easily determined, being merely the number of sq. cm. of the *cylindrical* surface of the commutator or ring for every ampere passing through the machine.

From the factor δ we are able to argue backwards and define the necessary brush characteristics for a required temperature rise and peripheral speed. Where the temperature rise and peripheral speed are normal, it is found that δ should be not less than 5 for a well-ventilated commutator where ordinary carbon brushes are required, and not less than 0.8 for a well-ventilated ring using copper-graphite or pure graphite brushes. For totally enclosed machines, δ should be increased to 8 or 10 for commutators. In the case of low-voltage machines, such as coppering generators or milking boosters, δ should be not less than 2, but successful cases are known where δ is as low as 1.2. Of course, highly metallic brushes are essential in such cases of low δ, and the low voltage generated permits of their use.

Brush Thickness.

The better the commutating conditions, the thicker may the brush be made with safety. For this reason, brush thickness is of less importance in interpole machines than in non-interpole machines. Commutating conditions are, however, invariably far from ideal, and thick brushes, in spite of decreasing the current density and e.m.f. of commutation, often give rise to commutation troubles of which circulating currents are a prolific cause. It is therefore necessary in practice to reduce the brush thickness to a value which is sufficiently reasonable to avoid excessive commutation e.m.f. Various writers on this subject have specified this reasonable thickness in terms of the number of commutator bars shorted, but machines are so varied that this does not lead to a rule which is generally applicable. Experience with a large number of machines has shown that a much more useful factor is the thickness of the brush expressed as a percentage of the commutator pole pitch. This factor will be called γ. Expressed mathematically, γ is equal to $100\ p\ t/\pi d$, where t is the brush thickness in inches, p the number of poles, and d the commutator diameter in inches.

* "Mica and Commutation Troubles," *Electrician*, July 6th, 1917.
"The Examination of Commutation Conditions in Interpole Machines," Electrical Review, August 24th, 1917.
"Iron Commutators," Electrical Review, January 18th, 1918.
"Adjusting Metallic Brushes on Rotary Converter Rings," Electrical Review, October 3rd, 1919.
"Brush Selection for Electrical Machinery," Electrical Review, October 17th, 1919.

A good average figure for γ in normal machines is 5. For low-voltage machines, a γ of 10 to 15 has been found satisfactory. For high-speed commutators, the tendency should be to increase γ above 5 if other conditions allow.

To illustrate the use of γ, in various cases where sparking trouble and quick brush wear has been experienced, γ has been found to be 8 or 9, and by cutting back the brushes to make γ about 5, the trouble has been cured. Very often by thus cutting back, the current density at the contact surface of the brush has been actually reduced, due to the elimination of excessive circulating currents.

The Fundamentals of Brush Selection.

There are four fundamental factors which must be known before a grade of brush can be scientifically selected for a particular machine. Two of these, γ and δ, have already been discussed. The two remaining ones are α, the current density in the brush in amperes per sq. in., and β, the peripheral speed of the commutator in feet per minute.

The choice of the best grade should be arrived at from the consideration of these four factors as a group. It is therefore necessary to have in mind what are the normal values for α, β, γ and δ so that any deviation from the normal can be quickly detected and the choice of grade influenced accordingly. For normal machinery using the cheaper grades of carbon brush, these values are as follows:—

$$\alpha=40 \qquad \beta=2{,}500 \qquad \gamma=5 \qquad \delta=5.$$

Having determined the actual values of these factors, it is necessary to examine in what respects any abnormality is present. For instance, if α is, say, 60, it will be necessary to consider the use of a highly graphitic brush with probably a well-recessed commutator. If β is, say, 4,000, the brush chosen must not be abrasive, and a lubricator type of brush with recessed mica is indicated. The factor γ must be considered in relation to α and the type of machine, and its main use is to indicate whether brush thickness is likely to interfere with performance. δ is very important since it indicates whether the heating conditions are difficult or easy. If difficult, a brush with low friction coefficient and low contact drop is indicated. If δ is high, then friction and contact drop are of less importance, and a cheap carbon brush is admissible.

As stated, the four factors α, β, γ and δ, must be considered as a whole, and anyone who works on these lines will find the problem of brush selection not only shorn of any mystery, but becoming increasingly easy and reliable as use is made of the method.

The Metering of Electricity.

Domestic Supplies in Artisans' Dwellings.

By S. H. PENNING.

The supply of electrical energy for domestic purposes will probably form a very important part of the business of electricity undertakings in the future. There is also strong evidence of a demand arising for domestic supplies for the smaller type of houses occupied by the artisan class. If this tendency is encouraged, it is possible that the demand from this type of house may increase to very considerable proportions, in view of the fact that the great majority of new houses being built at the present time are of this class.

It is also most important that the introduction of the use of electricity into these homes should be pressed from the points of view of cleanliness of the home and atmosphere, and the saving of labour.

The domestic electrical apparatus on the market to-day is far from being perfect, the public generally are unaccustomed to its use; a certain amount of education of the consumer and vigilance on the part of the manufacturer is necessary in order to avoid unnecessary expense and waste and to make them as safe as possible in their every-day use. Probably most important of all is the question of the price of electrical energy for such purposes.

I venture to think that this is one of the greatest stumbling blocks to the introduction of electricity into the home at the present time. Supply authorities still think in terms of lighting, heating, cooking, battery charging, water heating, &c., in connection with the supply of electrical energy for these purposes, and have adopted a multiplicity of charges to cover the various uses to which electricity can be put. In many cases it is very difficult to separate the one from the other; for instance, when a plug is fitted in a dining-room for the use of an electric radiator, what is to prevent the owner from using it for a table reading lamp? It seems absurd to endeavour to force the occupier to install two plugs, one for lighting and another for power.

If electricity is to become popular in the home for the purposes of lighting, heating, cooking, washing, water heating, &c., it will not be possible for the supply undertakings to make distinctions between the various uses to which it is put; they will be compelled to adopt a tariff that will be applicable to all purposes.

Some supply authorities have adopted a low average price per unit for domestic supplies, round about 2d. per unit, but this is little better than a makeshift. It does not please anyone; either it is too cheap if the consumer uses it for lighting only, or it is too dear if he uses it to the extent of, say, a thousand units per annum for an average house.

Due partly to the ignorance of the general public of the use of domestic electrical apparatus and the quantity of electrical energy required to perform certain duties, and to the ease with which electricity can be turned off or on, it is essential have some check upon its use. A very convenient check is found in the prepayment meter, as it is impossible to leave the current on unintentionally without the meter cutting it out of use within a short period by the operation of the prepayment switch. Great improvements have been made in the construction of prepayment meters in recent years, and they can now be relied upon to perform their function accurately and without trouble.

The only suitable tariff to meet the conditions of a supply of electrical energy for general domestic purposes is one based upon the principle of a fixed charge, plus a low running charge or cost per unit. It has been difficult hitherto to apply this principle where prepaymnt meters are in use. In some cases the fixed charge is collected with the rent of the house by the weekly rent collector, the prepayment meter taking charge of the low running charge per unit; this, however, is not always convenient or possible.

The writer devised, some few months ago, means by which the total charge—that is, both the fixed charge and the low running charge per unit—may be collected by the prepayment meter. This is carried out by making the meter advance at a constant speed, its rate being proportional to the fixed charges over a definite period. This may be secured either by making the meter run on shunt, or by the introduction of a small transformer, the secondary of which is connected across the series winding of the meter, the ratio of the trans-

former being so arranged as to give the correct rate of advancement to the meter.

The cost to the supply undertaking of the electrical energy consumed in procuring this advancement will be very small indeed, and represents a very small proportion of the moneys recovered under this head.

The meter can be made to take into account those periods during which the occupiers are away on holiday; on the other hand, some supply authorities may not wish to include such periods, they being in all probability a small proportion of the total time. To cover either of these views, it is only necessary to include or exclude the prepayment switch. If the switch is included in the circuit, the meter will stop when the value of the coin has been entirely used up.

By such an arrangement it is possible to have a prepayment meter rated at one price per unit, but capable of collecting the fixed charge (based upon the kilowatt capacity of the house, its rateable value, or other method of assessing a fixed charge, to which may be added any other fixed sum, such as rental for cookers or other apparatus), and also a small running charge, such charge being proportional to the actual number of kilowatt-hours supplied to the consumer.

In this way the great benefits to be derived from the use of electrical energy in the homes of the artisan class may be secured at a price per unit which will be reasonable, and proportionately cheaper per unit the more it is used—neither too cheap for lighting, nor too dear for a general purpose supply.

The Broadcasting Committee, 1925.

Its Chief Recommendations and some of its Observations.

The Committee of 10, under the chairmanship of the Earl of Crawford and Balcarres, which was appointed by the Government towards the end of 1925, "To advise as to the proper scope of the broadcasting service and as to the management, control, and finance thereof after the expiry of the existing licence on December 31st, 1926. The Committee will indicate what changes in the law, if any, are desirable in the interests of the service," after meeting on 16 occasions and hearing the evidence of 22 individuals and groups, has presented its report* to Sir W. Mitchell-Thomson, H.M. Postmaster-General. At the outset it records its admiration for the work accomplished by the British Broadcasting Co., Ltd., and indicates that it has made full use of the report (Cmd. 1951) of the Committee appointed by the Postmaster-General in April, 1923, under the chairmanship of Major-General Sir F. Sykes, which surveyed the situation then. The principal recommendations are as follows:—

That the broadcasting service should be conducted by a public corporation acting as a trustee for the national interest, and that its status and duties should correspond with those of a public service; it should either be set up by Act of Parliament, or be incorporated under the Companies Acts, limited by guarantee; in either case the corporation should hold the licence of the Postmaster-General for a period of not less than ten years.

The "British Broadcasting Commission" should consist of not more than seven, or less than five, Commissioners, all nominated by the Crown, the first to hold office for five years; one of the Commissioners might, if thought desirable, be one of the existing members of the British Broadcasting Co., and they should have power to appoint an executive Commissioner with a seat on the Board; all Commissioners should be adequately remunerated, and they should appoint, in consultation with appropriate societies and organisations, as many Advisory Committees as are necessary to ensure due consideration of all phases of broadcasting.

The entire property and undertaking of the British Broadcasting Co. as a going concern should be vested in the Commission on January 1st, 1927, and all existing contracts and staff of the Company should be taken over by the new Commission; the Postmaster-General should remain the licensing authority and be responsible for collecting the licence fees; the detection and prosecution of those who conceal their equipment should be vigorously pursued. Provision for experiment and research should be generous, and the Commission should be empowered to raise capital.

The fee of ten shillings for a receiver's licence should be maintained; the first charge on the revenue from licence fees should be the expenditure incurred by the Postmaster-General in connection with the broadcasting service. After paying the Commissioners an income thoroughly adequate to enable them to ensure the full and efficient maintenance and development of the service, any surplus should be retained by the State. The Commission's accounts should be reviewed by the comptroller and auditor general.

The Commissioners should be entitled to all the ordinary rights as regards the use of copyright material (whether in news or otherwise) and it is unnecessary to invest them with any special privilege or preference. The claims of those listeners who desire a larger proportion of educational matter, though relatively few in number, should, if possible, be met; a moderate amount of controversial matter should be broadcast at the discretion of the Commissioners, and licences should be granted to blind persons free of charge.

Although Parliament must retain the right of ultimate control and the Postmaster-General must be the Parliamentary spokesman on broad questions of policy, the Commissioners should be invested with the maximum of freedom which Parliament is prepared to concede; the Commissioners should present an annual report to Parliament.

In the course of its general observations the Committee remarks, *inter alia*:—

The repayment of their subscribed capital to the shareholders in the British Broadcasting Co., provision for its debts and liabilities, cost of liquidation, and the fulfilment of pending contracts, &c., can be made without serious difficulty under the terms of the licence and existing arrangements with the Postmaster-General. The Committee attaches the greatest importance to maintaining continuity between the old authority and the new. Arrangements must be completed in good time, as it would be most unfortunate were there to be any dislocation of the service, or any withdrawal (even temporary) of the programmes for which listeners have paid; the injury caused by any such interruption might be lasting. Where, in view of the changed conditions, it may later on prove necessary to dispense with the service of individuals who would otherwise have been retained, compensation should be paid from the revenue of the Commissioners on a scale to be approved by the Treasury.

However the new Commission be constituted, the organisation of the Board, or governing body, and its Committees seems identical. It has been suggested in evidence that the Board should be composed of persons representing various interests, such as music, science, drama, education, finance, manufacturing, and so forth, but the Committee cannot accept this view, since compromise and even conflict might ensue owing to division of allegiance. On the contrary, it holds that the Commissioners should be persons of independence, free of commitments, and that they will inspire confidence by having no other interests to promote than those of the public service. Advisory Committees, of which a considerable number can be appointed, may frankly comprise advocates, as their duty will be to ensure due consideration for particular phases of broadcasting. The Commissioners should appoint these Committees, and in doing so will doubtless consult societies and organisations which are qualified to advise on questions of *personnel*.

Regarding finance, the Committee assumes that increasing outlay on plant will be necessary; moreover, the Commission must be self-supporting and can expect no grant from public funds. It is anticipated that the overhead and administrative charges of the new authority will rise; its Committees will, in effect, be continuing responsibilities and the control of programmes will be more onerous than hitherto. The duties pertaining to the chairmanship will absorb the greater part of any man's time, and it would be most unfortunate if the programmes came to be treated as matters of routine; even if the cost is considerable, it will prove a wise investment to pay such fees as will secure the best available service.

Outlay on bold experiment should not be meagre; research should be constant, both official and unofficial. The Commission should be empowered to raise capital on the security of its income from licence-fees, and the Treasury might also be authorised to advance capital for approved purposes. All witnesses seem to agree that improvement of the service will increase the number of licensees. When an adequate service has been assured, but not until then, it is expedient that the surplus should be retained by the State.

The Committee points out that it cannot devise an organisation which may not be shown by experience to need revision. On the one hand, it is conceivable that broadcasting might have to become a department of State like the telephone service: on the other, it is possible that its character as a monopoly might have to disappear, and that the rights of transmitting should be distributed. While, therefore, it is essential that the new Commission should be so constituted as to command public confidence, it is equally clear that should

*Cmd. 2599. H.M. Stationery Office; price 6d. net.

circumstances change, the Government shall be able to supersede, or modify, the Commission. It must be laid down that so soon as its licence expires, or is withdrawn, the Commission, on due provision being made for the discharge of all debts and liabilities, shall be bound to transfer, or dispose of, its whole undertaking in such a manner as the Postmaster-General may direct.

The British Broadcasting Co. has enjoyed certain patent rights advantages which may not appertain to its successor. It has been permitted, without royalty, to use some transmission patents which are the property of constituent members of the Company, but even if their continued user is essential to broadcasting, their existence will not impose any impossible burden on the new authority. It will not be to the commercial interests of the patentees to hamper that authority by making such user unnecessarily burdensome, and in this connection Section 29 of the Patent and Designs Act, 1907, may not be without its relevance.

The Committee received a good deal of evidence, sometimes vague, sometimes specific, showing that broadcasting is viewed with alarm by various interests of importance. Such representations have reached it from the Press, concert-givers, proprietors of theatres and music-halls, as well as from owners of dramatic, musical, and literary copyright. Apprehension is generally felt lest broadcasting should supplant existing agencies, professions, or pursuits. The evidence is conflicting, for speculative elements abound, and the Committee is far from convinced that these forebodings are just in that one all-important factor is omitted therefrom. The fears of those who have expressed them are based upon the effect on their existing clientèle, whereas there are multitudes to whom these things are a closed book to-day, whose appreciation may well be brought into being, and formulated in such a manner by broadcasting as to create a new and extensive audience with its fresh demands and requirements. Secondhand versions, even when reception is more perfect than now, are not a full substitute for the original performance, and in the long run art will not be injured by science, nor the printed page be displaced by the spoken word. Broadcasting is not only an institution, but has become a necessity throughout the civilised world. At the same time those who supply the raw material of broadcasting should be adequately rewarded. Experience will prove that apprehensions, though natural enough at present, will in the future be allayed.

The Committee is much impressed by evidence from authoritative witnesses who advocated the vigorous and extended employment of broadcast education in its widest and most liberal sense. A demand exists which deserves every encouragement, although it is clear that educational transmission may in existing circumstances have to give place to other items, and would suffer from such irregularity. A solution may possibly be found in the allocation of a special wave-length for a special subject, perhaps for several subjects, or again for a particular standard of a particular subject, such as music. Scientific and financial problems of magnitude are involved, and meanwhile the Committee recommends the Postmaster-General to continue negotiations which have recently been initiated in connection with a scheme for new high-power stations. The listener is entitled to latitude; he must not be pressed to assimilate too much "highbrow" broadcast, but at the same time every effort must be made to raise the standard of style and performance. The gradual infusion of improved standards will be welcomed by listeners, unconsciously at first, but with growing appreciation amongst those who will instinctively learn to desire better performances.

Appendix I, besides a list of witnesses, contains particulars of written evidence, while Appendix II is a historical summary of the broadcasting service in Great Britain. The expenses incurred in preparing, printing, and publishing the report are estimated at £106.

An Institution of Fuel Technology.

Organising Committee Formed.

THERE was a very largely attended meeting at the Institution of Civil Engineers, London, on Friday, March 5th, when the desirability of forming an Institution of Fuel Technology was discussed, and resolutions were passed in favour. The audience contained a large proportion of electrical engineers.

Sir WILLIAM LARKE (Director of the National Federation of Iron and Steel Manufacturers), who presided, said the meeting had been called as the result of a strong desire on the part of a large number of people concerned with the production and use of fuel, to form an organisation on a national basis capable of investigating the whole of the problems concerned in a manner which was not possible to any existing organisation. In reply to the preliminary letter which had been circulated, 400 people had expressed unqualified support, although a small number had dissented or remained neutral. Fuel practice and problems in widely divergent industries, however, had so much that was fundamentally common, that an organisation specially designed to provide a means of co-ordinating experience and results must be to the national advantage and contributory to the general improvement of industrial efficiency. There at present existed an Institute of Fuel Economy Engineers, but he understood that that body was willing to co-operate so that there should be one national organisation of the nature contemplated. It had been suggested by some people that the work of such an organisation dealing with fuel could be carried on as a section of on of the existing institutions, but such a fuel group would no cover the field so effectively as an organisation devoting itsel solely to the task.

Sir PHILIP DAWSON, proposing a resolution that an institut should be formed having for its objects the promotion of th efficient production and utilisation of fuel, and the co-ordina tion of work in this country and abroad associated with th scientific utilisation of fuel in industry—which resolution wa seconded by Sir Richard Redmayne—said that in the mos efficient electric power stations, fuel represented 50 per cen of the cost of generation, whilst it represented between 3 and 45 per cent. of the cost of operating locomotives. Tha was sufficient to show the importance of finding means fo utilising more efficiently and more economically the fuel re sources of the country. The average quantity of coal used i electricity generation was 2.53 lb. per kWh, but as evidenc of what could be done by scientific methods, he mentioned tha at the Barton power station of the Manchester Corporation with a load factor not exceeding 30 per cent., the fuel con sumption had been reduced to 1.35 lb. He had just returne from a visit to Germany where he had ascertained that on of the largest steel works there, by the scientific applicatio of heat, had been able to reduce its fuel bill by £25,000 pe month, which was equivalent to 3s. per ton of steel made there

On behalf of the Institute of Fuel Economy Engineers, i was stated that whilst the Council of that body was in ful accord with the desire to have one national organisation, i was felt that the existing Institute should be taken as foundation upon which to build the more comprehensive body and an amendment to the resolution was moved to the effec that a committee be appointed to confer with the Council o the existing Institute, and enlarge or amend its constitutio in any way thought fit. This amendment was eventuall withdrawn on an assurance by the chairman that the Institut of Fuel Economy Engineers would be represented on th organising committee, which it was proposed to appoint, thus in effect, doing what the amendment proposed.

Dr. E. W. SMITH expressed the view that it would be unwis to form yet another institution, and contended that the wor in view could be done by a special group of the Society o Chemical Industry, after the manner of the chemical eng neering group of that Society, which was an autonomous bod with its own committee and officers and its own proceedings One or two other speakers were inclined to take the sam view, but they were heavily outnumbered by those who wer firmly convinced that a separate organisation was required having in mind the fact that fuel entered into all industrie in some degree, but that none of the existing societies coul deal with it in a really comprehensive manner. It was als explained that the proposed Institution of Fuel Technologists— or whatever name the organising committee might eventuall adopt—was intended to have as wide a membership as possibl so as to bring in manufacturers and others who at presen could not join many of the existing institutions and, moreove that membership would in no way imply a qualification t practise in connection with fuel technology.

Eventually, the resolution proposed by Sir Philip Dawso was passed *nem con.*

Principal G. KNOX, of the South Wales School of Mine proposed that an organising committee should be elected t determine the general basis of organisation, and to defin more specifically the object of the work of the proposed in stitution. This was adopted, and amongst the members pro posed were Sir Philip Dawson, Mr. S. McEwen, Sir Richar Redmayne, Mr. W. M. Selvey, Prof. R. V. Wheeler, Mr. D Wilson, and Mr. C. P. Sparks. The chairman gave an unde taking that the committee would deal with the appointmen of representatives of the Institute of Fuel Economy Engineer at its first meeting, and it was resolved that the organisin committee be requested to prepare a report as to the con stitution of the proposed institution, and to make recom mendations as to the name thereof.

Wireless on Aircraft.—The "Norge 1," the airship i which the well-known Polar explorer Amundsen is to attemp to fly from Europe over the North Pole to Alaska, and whic will pass over London on its journey, has been equipped wit wireless. By special arrangement with the Marconi Co. th vessel is to be equipped with transmitting apparatus which wi enable the commander to keep in touch with either land or shi stations at distances up to 1,000 miles. Receiving apparatu specially designed to cover a wave-range of from 300 to 25,00 metres will also be carried, whilst direction-finding apparatu will be installed which will enable the navigators accuratel to determine their course and direction even over the Pol itself when the compasses will be of no navigational value since all direction will be due south. The direction finde will enable all the long-wave European and American station to be picked up and oriented with ease, large loops having bee erected right round the envelope of the airship; by this mean the sensitivity of the apparatus has been made much greate than any hitherto employed on any aircraft. The Marconi Co is making arrangements to forward any reports from amateur of reception from the airship during its flight to the Nort Pole to the wireless officer with the expedition. The airshi has been reconditioned in Rome, and is now carrying out it trials.

Reviews.

The Dynamical Theory of Gases. By J. H. Jeans, F.R.S. Pp. 444; 28 figs. London: Cambridge University Press. Price 30s. net.

This is the fourth edition of Dr. Jeans's classic work, which has this year attained its majority. We reviewed the third edition at some length in 1921, and the present issue differs only in that the author has made the few changes necessary to bring the book up to date.

Dr. Jeans stands in the front rank of mathematical physicists, who nowadays occupy a commanding position in the attack on the hidden mysteries of Nature; it is singular that the battle rages at two extremes—around the constitution of the atom on this globe, and about that of the giant suns at distances from us of which the human intellect can form no adequate conception. We are told that in the latter case we have to deal with atoms stripped of their electrons, and therefore able to pack so closely together that the density of the gases is 1,000 times that of platinum. And now we learn that Dr. Millikan has demonstrated the existence of a type of radiation of far shorter wave-length even than X-rays, which he ascribes to nuclear transformations, but as yet we know very little about the structure of the nucleus. The marvels of these explorations of the infinitesimal are as amazing as the intellectual genius which has directed them and interpreted their results; as Dr. Jeans remarks, there is still vastly more to learn than has already been encompassed, and his own work, of which this volume forms a brilliant part, has been most fruitful in pushing on the advance of science into the unknown.

Photo-Electricity; the Liberation of Electrons by Light, with Chapters on Fluorescence and Phosphorescence, Photo-Chemical Actions and Photography. By H. Stanley Allen, M.A., D.Sc., F.R.S.E. 2nd Edition, Pp. xi + 320; figs. 43. London: Longmans, Green and Co. Price 18s. net.

This is the second edition of a work by Dr. Allen, the first edition of which appeared in 1913, and forms one of the series of "Monographs on Physics," edited by Sir J. J. Thomson, O.M., F.R.S., and F. Horton, D.Sc., F.R.S.

Great strides within recent years have been made in this domain of science and the appearance of a new edition of the monograph is timely. During the interval since the publication of the first edition much has been added to the knowledge of photo-electricity and probably no branch of physics has made such tremendous advances. A second edition has been rendered necessary due to the modifications in our ideas and concepts of atomic structure consequent on the classical researches of Rutherford, the Braggs and many others, and the distinct change in views as to the relation between matter and radiation by the development of Planck's quantum theory by Bohr. The outstanding advance in the subject is due to Millikan, who has proved that photo-electric emission conforms exactly to the rules of the quantum theory and provides us with one of the most accurate values for Planck's constant.

The author states in his preface that "the chief aim in this edition has been to give a connected view of the subject of the liberation of electrons by ordinary and ultra-violet light, showing how the experimental facts have led up to, and may be expressed in terms of, modern theories of matter and radiation." In this the author has succeeded admirably.

The term photo-electricity denotes the release of electrons by certain metallic surfaces and the change in state of electrification of a body produced by the action of light. The number of electrons released is proportional to the intensity of the light, and there are very accurate methods of determining this number. By photo-electric methods minute changes of magnitude are detected that were concealed from the older methods and there is every indication that the photo-electric photometer, in particular, will make very important contributions to our knowledge of the Universe as a whole. It is capable of measuring the brightness of a star with an accuracy of one thousandth of a magnitude. Photo-electric cells have also been shown to greatly increase the accuracy of measurement of the energy distribution in a spectrum and have been applied in measuring the temperature of a few stars. The photo-electric cell will prove to be an instrument of much value in pure scientific research and in investigations of a technical character, and may rival in certain commercial and industrial applications, the thermionic valve. This affords yet another instance of the uses to which results obtained from highly specialised investigations may be put, and the unforeseen practical applications which may ensue.

By direct photo-electrical methods the existence of X-ray spectrum lines can be traced across from the shortest ultra-violet ray of wave-length about 900 A.U., to the longest X-ray of wave-length 8 A.U. Spectral lines of extremely short wave-length can also be obtained in a vacuum spectragraph so that the gap between the ultra-violet and the X-ray region has now disappeared. The subject of photo-electricity is of considerable theoretical and practical importance through its relation to photochemical processes of all kinds, particularly photography and phototheraphy. Photo-electricity has a direct bearing on photochemical processes in general and photographic changes in particular. Dr. Allen in this monograph has further developed the views of Professor Joly as to the nature of the latent photographic image, and explanations are offered on the complicated phenomena of photographic reversal.

The treatise under review gives a wide survey of the present state of knowledge of photo-electricity. In the introductory chapter an historical review is given. In the succeeding chapters an account is given of the outstanding experimental work on the subject, photo-electric action and fatigue, fluorescence, phosphorescence, photochemical actions, photography, phototheraphy and the photo-electric theory of vision. An important chapter in the monograph is that on the "photo-electric activity of gases," experimental results having already shown that ionisation is produced in the atmosphere of the earth by the solar rays.

The author is to be commended for adopting the admirable plan of limiting the size of the monograph by providing a bibliography of all the relevant papers published on the subject between 1913 and 1924, together with references at the end of each chapter to important articles and books bearing on the subject. The monograph contains much fresh information, Dr. Allen having carried out considerable original work in these delicate investigations and being thoroughly conversant with the extensive literature of the subject, has well summarised and balanced the evidence. The volume will be widely appreciated as a coherent, critical and reliable summary of this branch of physical science, covering a wide field of information, carefully sifted and condensed by one who from experience and aptness is well qualified to supply a clear and comprehensive view of an intricate subject. Much valuable experience is here digested and made easily accessible.

We can only recommend that everyone interested in the recent development of the subject, especially those undertaking further investigations, should study this volume very carefully; it is indispensable and an inspiration, and the only really modern treatise on photo-electricity.

Exercises in Practical Physics. By Sir A. Schuster, Sc.D., F.R.S., and C. H. Lees, D.Sc., F.R.S. Fifth Edition (revised). Pp. ix + 373; figs. 136. Cambridge: University Press. Price, 12s. 6d. net.

This well-known laboratory text book is intended for students preparing for final B.Sc. examinations. It covers a course of 73 experiments, and the description of each is accompanied by some discussion of the underlying theory, and of the method of recording the observations and deducing the results. In this course of work there are twelve experiments on General Physics, twelve on Heat, three on Sound, sixteen on Light, and thirty on Electricity and Magnetism. The most important changes since the last edition are the omission of Hygrometry, the addition of an experiment on Newton's rings and an extension of the section on Electricity and Magnetism, which has been raised in standard and brought up to date by the inclusion of experiments on the triode valve, the quadrant electrometer and ionisation currents. The instructions for carrying out the experiments are clear and concise and the apparatus is adequately described. The authors have been content, however, to tell the student what to do and how to do it, and have not included any of those stimulating questions which, no doubt, they would ask of students in their own charge who had worked through the various experiments they have described. They may think, perhaps rightly, that these questions would come better from the teachers concerned.

The first three chapters deal respectively with the Treatment of Observations, the Measurement of Length, and the Measurement of Time. In the first a brief reference is made to the normal probability curve and to a number of theorems bearing on the probable error of a result calculated from a number of observations. In the limited space allotted to it the treatment cannot be very full, but adequate references to standard works are given and the student who wishes to pursue the subject further may easily do so. In the third chapter the given theory is applied to the problem of determining the periodic time of a galvanometer from twelve successive readings of the time at which the needle passes through zero, in a given direction. The readings are taken to the nearest second. The authors show that according to the theory of Chapter I, the smallest probable error will be made in interpreting the observations if the first four and last four only are considered, the middle four being rejected, although they are not regarded as untrustworthy. This process will almost certainly arouse the suspicions of the thoughtful student. The final result is given as 9.656 sec., without any hint that the second figure may be wrong. The acceptance of this result virtually involves the rejection of the second or the eighth reading for which there is no apparent justification. A careful examination of the readings indicates that the true periodic time lies between 9.666 and 9.700, and reveals no reason for suspecting any error of observation in the whole series.

The topic is one which well deserves a place in a book of this kind, but the authors are unfortunate in the particular illustration which they have chosen. It is rather surprising, too, in this connection, that nowhere throughout the volume do they appear to contemplate the use of a stop watch for such measurements as this.

This criticism relates to a very small portion of the book; however, most of the matter is excellent and will be found very useful by degree students in their final years and by teachers in charge of them.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Our Next Advertisement Competition.—We hope to announce in the course of a few weeks, the particulars of our Second Advertisement Competition. It is proposed to run it on the lines advocated by the judges in the last competition, in their article published on page 244 of the Electrical Review for February 12th, 1926, where they stated that it would be easier to judge the advertisements if they were divided into classes according to manufactures.

Electricians' Strike Settled.—The strike of the employés of Messrs. Grierson, who are carrying out the electrical work in the rebuilding of Devonshire House, Piccadilly, was settled last week. The men who were working for less than the standard electricians' rate left the job, and the 600 men who struck work as a protest resumed after a two-days' stoppage.

A Rating of Machinery Committee.—The Minister of Health has appointed a committee consisting of the Right Hon. Edward Shortt, K.C. (chairman); Mr. Arthur Body, F.S.I.; Mr. W. Craig Henderson, K.C., Mr. W. H. Patchell, M.Inst.C.E., and Mr. A. H. Preece, M.Inst.C.E., to prepare a statement, in accordance with the provisions of Section 24 of the Rating and Valuation Act, 1925, setting out in detail all machinery and plant which appears to them to fall within any of the classes specified in the Third Schedule to the Act. The secretary is Mr. A. N. Rucker, Ministry of Health, Whitehall, S.W.1.

A Visit to the Chloride Works.—On February 16th about 100 members of the South Lancashire Section of the Institution of Post Office Electrical Engineers paid a visit of inspection to the works of the Chloride Electrical Storage Co., Ltd., at Clifton Junction, near Manchester. Very efficient arrangements were made for the reception and conducting of the visitors over the works, enabling them to understand fully all that they saw. The party was particularly interested in the examples of Post Office standard battery plates and cells for the new automatic exchanges. At the end of the tour the party and a number of the company's officials were photographed on the lawn at Crompton Fold, adjoining the works. This photograph is reproduced herewith. A speech of thanks was made by Mr. Herbert, on behalf of the Institution, and Mr. G. Stevenson, A.M.Inst.C.E., replied for the company.

Post Office Electrical Engineers at the Chloride Works.

Lighting Development in the Midlands.—On Tuesday, March 2nd, a meeting was held in the Queen's Hotel, Birmingham, to discuss the formation of a Lighting Service Bureau to serve the Midland area. A luncheon was arranged under the auspices of the E.L.M.A., and many gentlemen, prominent in the supply, wholesale and retail sections of the industry, were present. Mr. J. Y. Fletcher presided at the meeting, and, after addresses by Mr. C. W. Sully and Mr. W. E. Bush, a resolution in favour of the inauguration of a Lighting Service Bureau for the Midland area was proposed by Mr. R. A. Chattock and seconded by Mr. S. T. Allen. After several speeches by visitors in favour of the resolution, it was carried unanimously by the meeting.

Mining Automatic Telephone Approved.—The International Electric Co., Ltd., informs us that its automatic telephone system for mines has been approved by the Home Office under Regulation No. 132, after passing tests at Sheffield University.

Developments in the Radio Industry.—The *Broadcaster and Wireless Retailer* reports the formation of a new Society of Radio Manufacturers, of which Mr. W. H. Lynas is chairman *pro tempore*. Among the objects of the new body are the supporting and enforcement of all agreements entered into between the Society and its members or between the Society and other organisations for the strict maintenance of retail prices; and the approval and promotion of radio exhibitions. The Society, although primarily for the British manufacturer, permits the membership of foreign firms under certain conditions, as well as sole concessionaires for apparatus. Meanwhile the N.A.R.M.A.T. proposes to continue after reconstruction, and, according to Mr. Lynas, has approached seceding members with a view to their return. Particulars of the Society of Radio Manufacturers can be obtained from Mr. W. H. Lynas, 25, Savile Row, W.1.

The Threatened Engineering Lock-out.—The employés of Messrs. R. Hoe & Co., Ltd., last week decided to ignore the advice of the national executives of their unions to return to work pending negotiation regarding the matters at issue. Consequently the employers' lock-out notices posted on Friday last will operate to-morrow (Saturday) unless there are further developments after we have gone to press. A meeting of representatives of the London District Committees of the unions concerned met on Friday last and declined to endorse the national executives' advice to the men to return to work. An endeavour is being made to hold up public utilities in the event of the employers' proceeding with the lock-out, and a meeting of representatives of the unions was to be held to-day to discuss the matter.

In the meantime, at last Friday's meeting the engineering unions (London district) decided to proceed with their claim for an all-round increase of 20s. per week for their members and to ask for authority to take a ballot upon strike action. It was also proposed to secure authority to take a ballot upon the continuance or abandonment of the existing agreement relating to the avoidance of disputes which has been broken by the strikers at Messrs. Hoe's works.

Burnley and the E.D.A.—At a meeting of the Burnley Town Council on March 4th, Councillor Lees said that £56 seemed to be an extraordinarily big subscription to pay to the Electrical Development Association. Alderman Nuttall replied that the Association did a lot of publicity work and Burnley was greatly indebted to it. When the recent exhibition was opened the Association sent a representative who was of considerable assistance, and whose speech at the opening was worth the full subscription. They were asked to subscribe on the basis of energy generated, and the amount mentioned was in that proportion.

Unemployment.—There was a further reduction in the number of unemployed registered at the Employment Exchanges during the week ended February 22nd. At that date the total was 1,125,800, as compared with 1,139,228 on February 15th, and 1,236,065 on February 23rd, 1925.

A Multi-Circuit Radio Device.—A useful device for those interested in the construction of radio receiving sets has been produced by the Igranic Electric Co., Ltd. This takes the form of a seven-part folder which by simple manipulation can be made to show nine theoretical circuits, with corresponding pictorial diagrams, relating to a number of sets from a simple crystal set to a 4-valve receiver.

Social Events.—The staff of the Sterling Telephone and Electric Co., Ltd., Dagenham, met at dinner in the Abercorn Rooms, on February 20th. Mr. W. H. Peak, O.B.E., managing director, presided, and was supported by Mr. C. E. Hunter, works manager, and Mr. N. Blades, chief telephone engineer. The loyal toast was proposed by the chairman, and the toast of "The Firm" was proposed by Mr. N. Blades, and responded to by the chairman. A splendid musical programme was provided by members of the staff.

On February 27th the staff and employés of the Doncaster Corporation Electricity Department held their first annual dinner at the Red Lion Hotel, when there was an assembly of 75 persons, including Councillor T. Bramworth, chairman of the Electricity Committee, and other members of the committee. Mr. S. R. Windle, borough electrical engineer, presided, and gave the toast of "The Visitors," to which Councillor Bramworth replied.

The annual dinner of the employés of the Poplar Borough Council Electricity Department was held recently. During the evening Mr. Horace Bowden, the borough electrical engineer, was presented with a silver smoker's cabinet to mark his completion of twenty-one years in his present office.

Works Extension.—INTERNATIONAL COMBUSTION, LTD., informs us that it is considerably extending its Derby works at which "Lopulco" pulverised fuel plant is produced. The extensions include a new foundry section for heavy castings, and machine and sheet-metal shops. The transport arrangements are also to be improved.

Trade Announcements.—MR. W. A. WOOD, A.M.I.E.E., has opened an electrical contracting business at 131, London Road, Bedford, and would like to receive catalogues dealing with lighting, heating and power apparatus.

THE EASTERN ARMATURE WINDING CO. has removed to 73a, Garford Street, Poplar, E.

From to-morrow the address of MESSRS. WATSHAMS, LTD., will be: Windsor House, Victoria Street, London, S.W.1.

On Saturday last the WEINBAU INCANDESCENT & ELECTRICAL Co., 327-335, Commercial Road, E.1, opened new premises. The front of the building is flood-lighted and on the first floor is a fittings showroom containing over 600 types of lighting fittings, each wired independently of the others. Ample trade facilities are available.

Catalogues and Lists.—MARCONI'S WIRELESS TELEGRAPH Co., LTD., Marconi House, Strand, W.C.2.—Leaflets Nos. 1,053 and 1,054, dealing, respectively, with an extra selective receiver, and wireless call apparatus.

MESSRS. L. MCMICHAEL, LTD., Wexham Road, Slough, Bucks.—An illustrated leaflet advertising "Dimic" coils. Priced.

RAY MANUFACTURING CO., 350, Fishponds Road, Bristol.—A pamphlet dealing with the "Marshall" constant-potential battery-charging system.

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, Newman Street, Oxford Street, W.1.—Folder L.259, containing details and prices of the "Tungar" battery charger.

POPE'S ELECTRIC LAMP CO., LTD., 5, Arthur Street, New Oxford Street, W.C.2.—Folder No. 3,760, giving prices of "Elasta" vacuum and gasfilled lamps.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—The "Osram Bulletin" for February, containing notes on "Osram" installations, "Gecophone" radio apparatus, &c. This issue includes articles on the illumination of Bush House, Baker Street, and the Hearts of Oak Building (Euston Road).

THE JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, S.W.1.—A blotter with a calendar for March, illustrating the company's boiling plate.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38 39, Upper Thames Street, E.C.4.—March price sheet of electrical accessories and appliances. Fully illustrated.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—An illustrated and priced pamphlet (No. 390 D) dealing with "Sterling" loud speakers.

THE BRITISH-THOMSON-HOUSTON CO., LTD., Mazda House, Newman Street, Oxford Street, W.1.—A coloured and priced pamphlet dealing with "Mazda" colour-sprayed lamps. Also a mailing card advertising B.T.-H. radio valves.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—The "Benjamin Reflector" for February-March containing notes on industrial and commercial illumination and other matters.

RADIO INSTRUMENTS, LTD., 12, Hyde Street, New Oxford Street, W.C.1.—An illustrated pamphlet containing particulars of a new l.f. transformer with tappings to give seven different ratios.

MESSRS. HERBERT MORRIS, LTD., Loughborough.—Book 108, illustrating and describing worm-geared pulley blocks, and pamphlets dealing with battery trucks and vertical cross-tube boilers.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs.—A catalogue of paper-insulated cables containing exhaustive particulars of each type.

MESSRS. BAXTER & CAUNTER, LTD., 219, Tottenham Court Road, W.1.—A price list (March) of electrical materials, appliances, and accessories, including wiring devices, cookers, fires, &c.

MESSRS. HENRY JENKINS & SONS, LTD., Unity Works, Vittoria Street, Birmingham.—A well-illustrated and priced catalogue of lighting fittings, principally open and closed bowls.

Bankruptcy Proceedings.—W. J. AYLING, 2, Rosemount Villas, Ballards Lane, North Finchley, Middlesex, late electrical engineer.—The public examination of this debtor was held recently at the Court House, Barnet. The statement of affairs showed liabilities of £1,052, against assets of £7, leaving a deficiency of £1,045. Debtor attributed his failure to being unable to obtain money owing to him by a limited company which he promoted from his own business. He stated that he commenced business in 1900 as an electrical engineer at New Southgate, and subsequently traded at various other places. In July, 1920, he paid a composition of 7s. 6d. in the £ to his creditors on liabilities of £90, and in November, 1924, he transferred the business which he was carrying on at Edgware to a private limited company, of which he was appointed managing director. The examination was formally adjourned to be closed.

JOHN RIGG, chauffeur, Revidge Road, Blackburn, and FRANK STEAD, engineer, Samlesbury, trading at Old Chapel Street, Blackburn, as Rigg & Stead, radio engineers.—These debtors underwent their first examination at Blackburn Bankruptcy Court, on March 3rd. The liabilities were £250, and the deficiency £128. Debtors attributed their failure to want of capital and increasing competition in trade. Stead said when the partnership was commenced he put in £100 in plant and capital and Rigg furnished £100. They each took £3 a week in wages. They were solvent until their stock was sold by auction, when it did not realise the figure expected. Following the examination of Rigg, the Official Receiver asked for an adjournment so that Stead might furnish additional details regarding some furniture. This was granted.

JOHN F. STANIFORTH, wireless salesman, Central Beach, Blackpool, and formerly of Scarborough.—This debtor was examined at Blackpool Bankruptcy Court, on March 5th. The accounts showed liabilities of £923 and a deficiency of £903. Debtor attributed his failure to bad trade. The examination was adjourned.

H. E. MALLINSON, electrical engineer, Portelet, Tomline Road, Felixstowe.—Trustee, Mr. H. S. Gotelee, Official Receiver, 9, Arcade Street, Ipswich, released February 23rd.

J. A. REFOY (Varley Radio Co.), dealer in wireless apparatus, 178, Ancona Road, Plumstead.—Last day for proofs for dividend, March 17th. Trustee, Mr. T. Gourlay, 29, Russell Square, W.C.1.

T. A. WICKHAM, electrical engineer, Snaresbrook, Station Road, New Milton, Southampton.—First and final dividend of 2s. 10d. in the £, payable at the Official Receiver's Office, Midland Bank Chambers, High Street, Southampton.

A. KERSHAW and C. H. WOOD (Kershaw & Wood), electrical engineers and merchants, 9, Bradford Road, Dewsbury—Supplemental dividend of 8½d. in the £, payable at the Official Receiver's office, 12, Duke Street, Bradford.

A. KERSHAW (separate estate).—First and final dividend of 4½d. in the £, payable at the Official Receiver's offices, 12, Duke Street, Bradford.

C. H. WOOD (separate estate).—First and final dividend of 4d. in the £, payable at the Official Receiver's office, 12, Duke Street, Bradford.

C. J. BROOKES, wireless and gramophone dealer, 6, Cross Street, Wigston Magna, Leicester.—First meeting, March 12th, at the Official Receiver's office, 1, Berridge Street, Leicester. Public examination April 9th at the Castle, Leicester.

A. F. WEBB, electrician, 102, Duke Street, St. Helens, Lancs.—First meeting, March 12th, at the Official Receiver's offices, 11, Dale Street, Liverpool. Public examination, April 13th, at the Court House, Liverpool.

M. KELLY, radio apparatus dealer, 12, Jackson's Row, Manchester.—First meeting, March 15th, at the Official Receiver's offices, Byrom Street, Manchester. Public examination, April 16th, at the Court House, Manchester.

A. F. KINGDOM, electrical and mechanical engineer, Tavistock Street, Devonport.—First meeting, March 15th, at 11, St. Aubyn Street, Devonport. Public examination, April 9th, at the Guildhall, Plymouth.

T. BARTON, electrical engineer, The Electric Works, Ainsworth Street, Blackburn.—Application for discharge, to be heard April 19th, at the County Court House, Blackburn.

Company Liquidations.—WESTON ELECTRIC LIGHTING CO., LTD.—A meeting of members is called for April 6th, at 37, Mawdsley Street, Bolton, to hear an account of the winding-up from the Liquidator, Mr. J. Greenhalgh.

RADIO EQUIPMENT CO., LTD.—Winding-up order made March 2nd.

C.A.C. (RADIO), LTD.—A petition for the winding up of this company has been presented to the High Court by Messrs. Honeywill Bros., Ltd., of 79, Mark Lane, E.C., creditors, and will be heard in London on March 16th.

SCIENTIFIC RADIO, LTD.—Winding up voluntarily. Liquidator, Mr. J. E. Hartles, Alston Buildings, Spiceal Street, Birmingham.

Dissolution of Partnership.—C. LINDOP & Co., electrical and mechanical engineers, 8, Lower Breck Road, Liverpool.—Mr. J. L. Sleightholme and Mr. C. F. Lindop have dissolved partnership. Debts will be attended to by Mr. Sleightholme, who will continue the business under the same style.

Receiver Appointed.—SHENTON & Co., LTD.—Mr. W. B. Pearson, 5, John Street, Bedford Row, London, W.C.1, has been appointed receiver and manager. He is continuing the business and hopes that the ordinary creditors will eventually be paid in full.

Private Arrangements. — Albert Maund, electrician, Hoghton Street, Southport.—A meeting of creditors was held on March 5th, at Southport, when a statement of affairs was presented which showed liabilities of £1,320, and net assets of £457, leaving a deficiency of £863. It was reported that the debtor was originally employed by a firm of electrical engineers, but started trading in partnership many years ago at Lord Street, Southport. In 1902 the partner retired, but the debtor was then joined by another. The second partner died about fifteen years ago, and since that time the debtor had traded alone at various addresses. During the twelve months to June 30th, 1922, the sales were £3,797, but there was a net loss of £329. The following year the turnover fell to £3,015, but there was a net profit on the trading of £64. In the succeeding twelve months the sales still further declined to £2,568, with a net loss of £106. During the year to June 30th last the sales increased to £3,020, with a net profit of between £300 and £400. Since June 30th, 1925, the sales had been £1,416, with a net loss of £140. A resolution was passed in favour of the matter being dealt with under a deed of assignment, with Mr. Bond, of Messrs. Davies & Crane, of Southport, as trustee, together with a committee of three of the largest creditors. The following are creditors :—

	£		£
Electric Lamp Factors, Ltd.	... 210	Rowe Bros. & Co., Ltd. ...	... 73
General Electric Co., Ltd.	... 45	Ward & Goldstone, Ltd. ...	... 29

F. C. Brown (Electricity), Ltd., Union Street, Coventry.—A meeting of creditors was held recently, when a statement of affairs was presented which showed liabilities of £1,440, and net assets of £589, leaving a deficiency of £851. An offer of a composition of 2s. in the £ was submitted, it being stated that there were hopes of the business being carried on successfully. After some discussion the amount was increased to 2s. 6d. in the £, payable on August 1st next, and guaranteed; this was accepted.

For Sale.—Motherwell and Wishaw Burgh Council Electricity Department invites offers for one Willans-Siemens 1,100-kW d.c. turbo-generator with surface condenser, &c., four Willans 500-kW generating sets with condensers and auxiliaries, three B. & W. boilers with grate stokers, induced draught fan, economiser, &c. Messrs. Veryard & Yates will sell by auction on March 16th and following days at the British Empire Exhibition, Wembley, large quantiites of electrical cable and equipment, generating sets, motors, electric lamps, switchboards, &c. Walthamstow Urban District Council Electricity Department has for disposal two Belliss and Morcom triple expansion engines, direct coupled to Siemens Bros. & Co. generators, complete with air and circulating pumps. Dundee Corporation Electricity Department invite offers for two 2,000-kW Willans-Parsons steam turbines, coupled to Dick Kerr 3-phase alternators, with condensers and air pumps. Messrs. Jackson & Greenen, of 5, Yelverton Road, Bournemouth, have for disposal a complete electric light generating plant now in use at the Haven Hotel, Bournemouth. (See our advertisement pages to-day.)

Merchandise Marks.—The Merchandise Marks (Imported Goods) Bill has been printed and copies can be obtained at H.M. Stationery Office. It provides for the constitution of standing committees which will consider and report from time to time whether goods shall be required to bear an indication of origin at the time of importation and if an Order in Council ought to be made, and will recommend in what form and manner the indication of origin should be applied to the goods. An Order in Council may provide that imported goods so specified, if they cannot bear a mark of origin, shall not be sold or exposed for sale in the United Kingdom unless they are distinguished from similar goods of United Kingdom manufacture by some form of distinctive colouring or other variation in their make-up.

Swiss Foreign Electrical Trade.—An article upon Swiss foreign trade during 1925, from the British Legation at Berne, appeared in the *Board of Trade Journal* for March 4th. In this it is stated that the increase in the German Customs tariffs affected a number of important Swiss industries, including electrical apparatus, although the burden was somewhat lightened by a provisional agreement signed in December last. Negotiations are proceeding for a definite commercial treaty between Switzerland and Germany. The imports of apparatus during 1925 comprised electrical material, automatic telephones, and radio sets. Large purchases of vacuum cleaners were also made. The exports of dynamo-electric machinery rose from 6,222 tons to 7,558 tons, continuing a steady upward trend.

New Jugo-Slavian Insulator Works.—The *Gazette de Prague* states that a Jugo-Slav company has been granted permission to construct in Jugo-Slavia a factory for the production of porcelain insulators. The national administrations of Jugo-Slavia themselves absorb every year porcelain insulators to a large value. Moreover, the requirements of the Jugo-Slav market are bound to increase since the Government proposes actively to push forward the extension of the national telephone and telegraph systems. It appears that Germany is interested in the establishment of this factory.—*Reuter's Trade Service* (Prague).

Australian Tariffs.—The Sydney correspondent of *The Times* reports that the Prime Minister, Mr. Bruce, in reply to inquiries concerning the working of the Tariff Board, the appointment of which was announced last September (when the new Tariff Act was passed by the Federal Parliament), says that the work of the Board has been proceeding for many weeks. Some British manufacturers wanted a three months' adjournment of the Board, in order to consider the proposed increased duties. This period Mr. Bruce considered excessive, but he was prepared to grant manufacturers a reasonable time in which to formulate their views as to the new duties.

Book Notices.—" Principles of Electric Power Transmission and Distribution," by L. F. Woodruff. Pp. v+340; pp. 110. London: Chapman & Hall, Ltd. Price 20s. net.

" Pitman's Electrical Educator."—Among the additional subjects to be found in parts 10 to 13 of this work are " Historical Development of the Dynamo," by W. Cramp, D.Sc.; " Heat and Heat Engines," by M. E. J. Gheury de Bray; and " Electrical Welding," by E. Arthur Atkins, M.I.Mech.E. The series of articles on the " History of the Electrical Industry " is continued.

" House Wiring." By George A. Willoughby, B.Sc. Pp. xi + 219, figs. 209. London: Chapman & Hall, Ltd. Price, 10s. net.—This book deals fully with the knob-and-tube systems of installation work practised in America and Canada, but not to any great extent in this country. The system is a modification of the porcelain cleat methods; the wires are suspended on knobs on cleats and run in porcelain tubes through the walls, &c. The various cables and accessories used under the system are fully described.

" The Turbine Pump: What it is and what it does."—This useful little booklet, issued by the Pulsometer Engineering Co., Ltd., deals in a novel way with the construction and operation of the turbine pump. The information is arranged in the form of questions and answers, into which some interesting technical problems of speed, power, &c., are introduced.

" Radio Press Year Book," 1926. Pp. xxxv+169; illustrated. London: Radio Press, Ltd. Price 1s. 6d. net.—The collection of useful data and articles by representative authorities in this work of reference will appeal alike to the beginner and the more advanced experimenter. In the valve section is to be found up-to-date information about the various types to employ for different purposes, in addition to a large selection of characteristic curves. The calculations portion of the book has been written in simple language to facilitate the design of coils and condensers and the calculation of resistance, &c.; valuable hints are to be found in the workshop section, and other features are lists of amateurs' call signs, wireless societies, &c.

" Year Book and Directory of the South African Mining and Engineering Journal for 1926." London: Argus South African Newspapers, Ltd. Price 10s. 6d.; postage 1s. 6d. extra.

" The Red Club," by H. R. Taunton. Pp. 282. London: Hurst & Blackett. Price 7s. 6d. net.

Conditions in the Austrian Engineering Industry.—No change has taken place in the situation of the Austrian engineering works. German and Czecho-Slovak competition has been extremely keen in export business, but the commercial treaties concluded have been of special benefit to this branch of industrial production. The electrical industry is also in a very favourable situation. The " strong current " section in the first place has received a great impetus from the development of Austrian water power, the electrification of Austrian railways and the extension of the telephone system, although the capacity of the industry does not yet appear to be fully utilised. In the " weak current " industry production conditions are less favourable, principally owing to the fact that export business leaves much to be desired.—*Reuter's Trade Service* (Essen).

A Bootle Wiring Contract: Disclaimer.—Messrs. James Scott & Co., Knowsley Electrical Works, Brasenose Road, Bootle, ask us to state, in order to prevent confusion, that they are in no way connected with the Knowsley Electrical Co., Ltd., the contractors for the electrical installation at the Cleaver Sanatorium, Heswall, of the West Derby Board of Guardians.

A committee of the Guardians which investigated the matter of the contract recommended the Board to " place on record their disgust that cable and tubing inferior to quality specified should have been so extensively and deliberately employed upon the job, and that the name of the Knowsley Electrical Co., Ltd., be entered in the record of unsatisfactory contractors." The company is to make full replacements of the material referred to. In the course of a discussion by the Board of Guardians, Mr. James Maguire, vice-chairman of the Engineering Committee, who discovered the discrepancies, said that the material put in only cost £5 10s. per 1,000 yards, whereas that stipulated for in the contract was priced at £12 3s. It was a disgrace and a danger to put in tubing which resembled salmon tins. By 28 votes to 22 it was resolved to apply to the Ministry of Health for a judicial inquiry to be held into the contract

The contract was for the installation of electric lighting, telephones, motors, wiring, &c., at the Cleaver Sanatorium at £1,098 2s., and the tender was the lowest of nine received. The order was given out on September 10th, 1925. On January 8th, 1926, the architect wrote to the contractors condemning all non-association cable and requiring re-wiring with cable as per contract. The contractors replied undertaking to carry out the architect's requirements. A detailed report of the whole matter will be found in the *Bootle Times* for March 5th.

New Municipal Showroom. — The Lincoln City Council has decided to erect a new showroom for the Electricity Department.

Local Exhibitions.—Bacup.—At a meeting of the Town Council, on March 4th, Councillor J. Ireland, J.P., chairman of the Electricity Committee, stated that the recent Electrical Exhibition had been productive of good, the direct result being a much larger demand for current. So rapid had been the progress made that an extension of mains and services had had to be considered and provision made for the expenditure of £13,000 on this work alone during the next two or three years.

Bradford.—An Ideal Homes Exhibition at Belle Vue Drill Hall, Bradford, was opened on March 3rd by Alderman Wilfred Turner (Deputy Lord Mayor). The Bradford Corporation Electricity department had three attractive stands, at which daily demonstrations were given in electric cooking, washing, ironing, and cleaning.

Municipal Trading in Australia.—Parallel with the campaign which is being carried on in this country against electrical trading by municipal authorities, there is a similar movement afoot in Australia. The Sydney City Council recently decided to open showrooms for the exhibition and sale of electrical appliances. The Electrical Employers' Association has issued a pronouncement against this, characterising the Council's action as a gross act of repudiation of the recently-formed Electrical Development Association of New South Wales, whose formation was encouraged and assisted by the Council. The Association was formed by the electrical traders, principally, and financed by them to conduct a big educational campaign on behalf of electrical development and guarantees of £9,000 per annum for three years were obtained; the City Council agreed to contribute a sum not exceeding £4,000 per annum and the City Electrical Engineer (Mr. Forbes Mackay) was one of the first executive members. Then, it is said, the Council suddenly discovered that it had no legal power to allocate funds to the Association, and finally decided to drop the scheme and instead become a trading institution itself. No explanation was received in reply to the Electrical Employers' Association's protest. Thus the Council has become a direct competitor with every retailer within a 15-mile radius from the centre of the city, and "proposes to jeopardise the livelihood of men who have spent half their lives building up businesses; who have done their utmost to help the city sell electric current, and who have expressed themselves willing to combine their own interests with those of the Council to the extent of spending some thousands of pounds per year in increasing the use of the Council's current." It is stated that politically-controlled state and municipal enterprises are "almost invariably" inefficient and the announcement quotes the case of the London boroughs as examples of the bad results of municipal electrical trading (before the war), saying that Battersea, Bermondsey, Fulham, Southwark and Woolwich all made heavy losses. Another statement made is that "the average rates in the pound of the 14 Metropolitan boroughs not trading in electrical supplies were approximately, on an average, tenpence in the pound (equal to nearly £750,000) less than those of fourteen boroughs dealing in electrical supply. From this, it is obvious that when municipal trading fails, the burden of the loss falls on the whole of the ratepayers; when private enterprise fails, nobody suffers but the trader." The Association, in conclusion, calls upon trade organisations and ratepayers to "voice an emphatic protest."

The German Insulated Wire Industry.—Since the end of November, it is stated, business in the insulated wire industry in Germany has been almost at a standstill. Usually the season lasts from October to March, but for the past two months the demand has considerably declined. A number of Rhenish works has already been compelled to introduce restrictions in working and discharge workmen. Most producers, however, are less affected by the crisis as the manufacture of insulated wires only forms a small part of their output. The unfavourable course of business is attributed chiefly to the slackness in building operations and the scarcity of capital on the part of the installation firms; and a revival in the demand is scarcely expected from the recent reduction of 10 per cent. in prices.

English Plant for British Columbia.—The British Trade Commissioner at Vancouver (Mr. L. B. Beale) informs the Department of Overseas Trade that the laboratories of the mechanical and electrical engineering departments of the University of British Columbia, under the administration of Dean R. W. Brock, Faculty of Applied Science, and Dr. H. Vickers, Professor of Electrical and Mechanical Engineering, are now nearing completion with regard to equipment. It is interesting to note that practically all the equipment thus far installed is of British make. The following items, all of British manufacture, have already been installed, or are on order for installation:—A 50-b.h.p. Diesel engine, a 50-b.h.p. Froude brake, a 10-kW De Laval steam turbine and dynamo, a 12-h.p. "National" gas engine, an 11-h.p. "Crossley" oil engine, a 3-ton refrigerating plant, a 250-kVA alternator, a 250-b.h.p. compound engine in the power house, a 50-h.p. marine engine, two d.c. level-compound generators, a 3-phase rotary converter with transformer and starter, an induction motor, an oscillograph, an a.c. potentiometer, a d.c. potentiometer, galvanometers, condensers, resistances and other standard equipment, electrostatic voltmeters, four transformers, iron testing equipment, a 350-Ah, 220-V storage battery, a h.p. switch panel, instruments and current transformers, samples of cables, &c. A large number of British text books replacing American text books have also been purchased.

A Finger in the Pie.—Under the heading, "Just cut yourself a piece of pie—there's plenty left," *Electrical Merchandising* depicts a number of pies, each of which represents a class of electrical appliances. Out of each of these pies a wedge has been taken showing the proportion of wired homes which have been equipped with the appliance in question. Over each pie in large red figures is stated the proportion of these homes still without the appliance named For instance, it is shown that the electric iron "pie" has been consumed to the extent of 71 per cent., leaving only 29 per cent. available. On the other hand, hardly any inroad has been made in the case of refrigerators and dishwashers, ½ and ¾ per cent., respectively. It is surprising to learn that only 3 per cent. of the wired homes have electric ranges—although this means that there are about 435,000 in use. Heaters are in use to the extent of 10 per cent.; washers represent 21 per cent.; fans, 19 per cent.; percolators, 13 per cent.; vacuum cleaners, 31 per cent.; and toasters, 23 per cent.

Public Lighting Exhibition.—In connection with the annual meeting and conference of the Institution of Public Lighting Engineers at Newcastle-on-Tyne, it is proposed to hold an exhibition of up-to-date lighting appliances (both gas and electrical) from September 14th to 16th. Firms desirous of exhibiting should apply at once to Mr. R. Davison (President-elect), Public Lighting Superintendent, Corporation Lighting Department, Blagdon Street, Newcastle-upon-Tyne, stating the amount of space required and if electricity or gas will be needed in connection with their exhibits.

New French Companies.—Among the new companies recently formed in France are the Société d'Electricité de Danze, organised at Danze (Loire et Cher Department) with a capital of 100,000 fr., to establish an electricity distribution system in the town, and the Société de Regularisation des Forces Motrices de la Ville de Romanche formed in Grenoble with a capital of six million francs to establish another hydro-electric station on the River Romanche at Chambon (Isère).

Austrian Loan in Switzerland.—The A.E.G.-Union Electricitats Gesellschaft is reported to have concluded arrangements with a Swiss bank for the floating of a loan of seven million Swiss francs (about £280,000), repayable in 25 years.

A Swedish Company's Report.—The directors of the Allmanna Svenska Elektriska A.B. have now issued their report for 1925, which, as was mentioned previously, shows larger net profits and an increase in the rate of the dividend from 2½ per cent. in 1924 to 4 per cent. last year. According to the report, the turnover, both in the home and export markets, experienced an augmentation, although no improvement took place in prices. It was possible to reduce the costs of production as a result of the introduction of improvements in construction and simplifying the methods of working. Extensions of the workshops were carried out in order to meet the demand for still larger generators for hydro-electric works, and these additions, it is stated, will permit the company to produce such sizes of machines as are likely to be required for some years. The laboratory at Vasteras was transferred to more appropriate premises, and was provided with modern equipment. The stock of orders on hand at the end of 1925 was somewhat greater than the corresponding figures a year ago. Among the orders carried out during the year the report mentions the delivery of 43 out of the 50 electric locomotives ordered for the Stockholm-Gothenburg railway, besides motor generators and instruments for the transformer stations. The turnover in the mechanical department also showed an increase. At the end of 1925 the number of persons employed at the works and offices in Sweden was 6,403. The share capital amounts to 75,000,000 kr., and the financial position of the company is stated to have improved during the year.

Chinese Notes.—It is reported that the Chinese Eastern Railway has decided to install 13 power stations in towns upon its system during the next three years. The cost of the entire scheme is estimated at $469,000. In the first year stations will be erected at Anta and Suifeng.

Four companies are now operating electric lighting plants in Pinghu, Chekiang province, *viz.*:—The Ming Hwa Electric Light Co., the Sheng Chia Co., the Chapoo Co., and the Hsin Chi Co.

Long-distance telephone services have been commenced between Kweihwa, Sunyuanhsien, Paotowchen, and Wuyuan; and between Shanghai and Wusih, Kiangsu Province.

The Wuchow Electric Power Co. (Kwangsi Province), hitherto a private concern, has become a joint Government and private enterprise. A sum of $500,000 has been voted for the capital of the company from provincial funds.

Spanish Duty on Radio Valves.—Radio valves which, for import duty purposes, were formerly embodied in the section "incandescent electric bulbs," have now been given a separate heading in the Spanish Customs tariff. The duty is to be 156 pesetas (gold) per kg. net under the first tariff and 52 pesetas under the second.

A Czecho-Slovakian Amalgamation.—An amalgamation of the businesses of Siemens & Co., of Pressburg, and the Muglitzer Electricitäts Gesellschaft, of Muglitz, has recently been effected. The Pressburg works are to be devoted to the production of large electrical plant and those at Muglitz to small dynamos and motors and electrical apparatus.

The Rumanian Electrical Industry.—The Mid-February "Review of Central Europe," issued by the Anglo-Austrian Bank, Ltd., states that a number of Rumanian industries found it difficult to obtain funds during 1925 and had to have recourse to the National Credit Institution. Among these was the electrical industry, which applied for a grant of 244 million lei and received 101 millions.

New Portuguese Import Duties.—The *Diario do Governo* for January 27th contains a decree which raises a new heading in the Portuguese Customs Tariff for "complete installations for telephone exchanges," the duties being 3 centavos per kg. under the "maximum" tariff, and 1 centavo per kg. under the "minimum" tariff. This new heading is not regarded as covering accumulators, dynamos, or motors and their respective switchboards.—*Board of Trade Journal.*

Employment, Wages, and the Cost of Living.—A special supplement was issued with the February *Ministry of Labour Gazette* containing graphic details of wages in Great Britain and Northern Ireland, 1920 25; the comparative levels of real wages in the leading industrial countries; the aggregate duration of industrial disputes from 1900 to 1925; changes in food prices and cost of living, 1900-1925; unemployment from 1900 to 1925; a comparison of international unemployment, 1920-25; trade union membership, 1900-1925, &c. Each curve and diagram is of absorbing interest to the student of economic affairs, and the method of presentation causes many salient facts to become apparent at a glance. It is seen, for instance, that, gauged by the percentage of trade union members out of work, unemployment in 1924 fell below the 1908 level and was not a great deal higher in 1925. This same curve also illustrates the operation of the trade cycle, although the war period caused abnormal developments. The curves illustrating international unemployment show, generally speaking, a common tendency in each year; also that Great Britain was not afflicted with such violent fluctuations as a number of other nations. The "real wages" diagram (as at October 1st, 1925) shows that superior conditions existed in Philadelphia, Ottawa and Sydney. London and Oslo were about level. Real wages in Berlin were higher than in five other Continental capitals, the lowest being Lisbon. Paris, for some reason, is not included. The first curve shows that wages in Great Britain and Northern Ireland have remained practically unchanged, in the aggregate, for the past three years after a steep descent from the 1920 level.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. and Messrs. James & Shakespeare report, March 9th: No change in copper prices.

Messrs. James & Shakespeare report, March 9th: English pig lead, £33, 10s. dec.

Messrs. Edward Till & Co. report, March 9th: India rubber, Para fine, 2s. 1½d., 2½d. dec.

Swiss Glow Lamp Prices.—The glow lamp factories in Switzerland, which stand in a syndicate relationship with the other makers in Europe and the United States, brought into operation on February 9th a new list of prices, showing increases in some cases. Under the new regulation, lamps of low pressure (110 volts) have been placed on the same level as those for 220 volts.

Fire.—A fire occurred last week at the Anaconda Works, Salford, of Messrs. Frederick Smith & Co., wire manufacturers, and considerable damage was caused.

Vienna Telephone Cable Contracts.—Orders for the extension of the Budapest-Vienna telephone cable are reported to have been placed with a syndicate composed of the Felten and Guilleaume Company, the Siemens-Schuckert Company, and the Ver. Gluhlampenfabrik.

Lighting and Power Notes.

Accrington.—New Sub-Stations.—The Corporation Electricity Committee is considering the erection of three sub-stations.

Loan.—Application is being made for sanction to borrow £50,000 for mains required during the next four years.

Barking Town.—Loans.—Application is being made by the Electricity Committee for sanction to loans of £1,500 for mains extensions, and £2,250 for a l.p. feeder.

Bath.—Mains Extensions.—The Electric Lighting Committee has recommended the Town Council to extend the mains to Batheaston, Bathampton, and Bathford, at an estimated cost of £28,935.

Beckenham.—Electricity Extensions.—The Electricity Committee has prepared a scheme for the extension of h.p. feeders at a cost of £32,000.

Loan Sanctioned.—The Committee has received sanction to a loan of £10,000 for mains and services.

Birmingham.—Loans Sanctioned.—The Electricity Committee has obtained sanction to the borrowing of £11,000 for building alterations, £20,480 for cooling towers, £14,000 for plant, and £24,500 for sub-stations.

Blackpool.—Loan Sanctioned.—The Corporation has received sanction to the borrowing of £49,000 for mains and services.

Bolton.—New Plant.—The Electricity Committee has decided, on the recommendation of the borough electrical engineer, to install two additional boilers, complete with economisers, stokers, and accessory plant, at Back-o'-the-Bank station.

Electricity Extensions.—The Electricity Committee has decided to strengthen the e.h.p. cable system at a cost of £21,000, to provide additional switchgear at Spa Road sub-station at a cost of £9,000, and to install additional transforming plant at a cost of £4,300.

Bridport.—Electricity Scheme.—The Town Council proposes to introduce an electricity supply for the town, and application is being made for an Order to proceed with the scheme. The capital cost of the plant is estimated at £14,000 and a further sum of £800 will be required for the laying of a cable for the lighting of about 100 street lamps. It is estimated that at the end of three years further plant costing £3,000 will be required. The proposed charges for electricity are 10d. per kWh for lighting and 3d. per kWh for power. Mr. T. Hood, of Bristol, has been engaged as engineer to carry out the scheme.

Continental.—Portugal.—According to the annual report of the British Chamber of Commerce in Portugal, the water power available in the country amounts to 500,000 h.p., of which only 16,000 h.p. is utilised at present.

Belgium.—Of a total of 345 communes in the province of Brabant, 237 are now supplied with electricity. With regard to the remaining 108 communes, as the work of providing a distribution system is not sufficiently attractive to private enterprise, it is to be undertaken by the provincial authorities, who have provided a sum of 500,000 fr. for the purpose in their 1926 Budget.

France.—La Société des Forces Motrices du Vercors has secured a concession to establish a hydro-electric station to utilise two waterfalls on the river Lyonne, in the Department of Drome.

Germany.—A feature of the extension of the electricity distribution in the Rheinland district of Germany is the increasing use of lignite as the fuel for the boilers. It is reported that out of 1,797 million kWh supplied in the district in 1921, 40 per cent. was generated by coal, 49 per cent. by lignite, 9.5 per cent. by gas, and 1.5 per cent. by water. Last year the output amounted to 2,462 million kWh, and of this the proportion generated by lignite had increased to 54.7 per cent., while coal-using stations had dropped to 30.5 per cent. Those using gas as fuel had increased to 12.8 per cent., and hydro-electric stations to 2 per cent. The principal power stations in the area using lignite as fuel are the Goldenberg, the Fortuna I (40,000 kW), and the Fortuna II (80,000 kW).

Chile.—Valparaiso.—The Municipality of Valparaiso is considering a project for a new water supply system, which will also include plans for a hydro-electric plant to furnish an electricity supply to the towns along the route of an aqueduct leading from the Andean mountains to the city. Several favourable sites for the erection of the hydro-electric generating station have been found, and it is anticipated that approximately 40,000 kW will be available.—*Reuter's Trade Service* (Valparaiso).

Dereham.—Inquiry.—An inquiry into the application of the Urban District Council for authority to distribute electricity in its area was held by Mr. J. A. Lee, of the Electricity Commission, on February 25th. Mr. W. R. May, electrical engineer to Lowestoft Corporation, in outlining the scheme, said the estimated capital expenditure was £7,600, and the revenue was estimated at £1,350 per annum with working costs at £900. Mr. W. R. Long, Norwich city electrical engineer, said his Corporation proposed to carry its supply as far as Wymondham, and the capital charge for extending the main to Dereham would be approximately £600 per annum. The charge per kW would not exceed £5, and the "unit" charge would be about ¾d. Objections were raised by agricultural owners and occupiers on the ground that the scheme would be a burden upon the rates. The Commissioners will give their decision in due course.

Irish Free State.—Limerick.—At a recent meeting of the Electric Lighting Committee, the report of the electrical engineer on the subject of the proposed extension of the electric lighting scheme was considered, and it was decided to adjourn the question pending a further report on the matter. The estimated cost of the extension is £20,000.

Liverpool.—Loans.—The Electric Power and Lighting Committee is making application for sanction to the borrowing of the following sums for the provision of mains and services for the supply of electricity to houses in course of erection:—Walton-Clubmoor Housing Estate, £7,800; Knotty Ash Housing Estate, £6,052. Extensions of h.p. mains are to be carried out at an estimated cost of £600, and the equipment of a sub-station at a cost of £2,000 in connection with the Mersey tunnel works.

London. — Southwark.—*Electricity Supply.*—The Electricity Committee has recommended a scheme of extensions in preference to arranging for a bulk supply, and is making representation to the Electricity Commissioners accordingly.

Manchester.—Progress during January.—During the month of January, the Corporation electricity undertaking showed an increase in connections of 2,114 kW, bringing the total to 277,320 kW; and the number of applications received for supply, including existing consumers for additional supplies, was 811, representing a total of 1,645 kW. The number of hired cookers connected increased by 54, bringing the total actually on circuit to 1,307. Applications for the hire of cookers totalled 71. 500-kVA transformers were put into commission at the Lumb Mill, Droylsden, and Burnage sub-stations, one of 250-kVA at Messrs. J. Hetherington & Sons' Works, and one of 100-kVA at Droylsden.

Loan Sanctioned.—The Electricity Committee has received sanction to a loan of £120,000 for sub-station equipment.

Mansfield.—Committee of Inquiry.—As briefly reported in our last issue, a special committee has been appointed "to make a full investigation into the affairs of the electricity undertaking." During a debate upon the matter at a meeting of the Town Council, as reported in the *Mansfield and North Notts. Advertiser*, a number of matters were mentioned. The department was criticised for an alleged delay in the opening of a new showroom; for changing over to a bulk supply and "scrapping" the generating plant; for laying cables which had lain idle for a long period; for the high price of energy; and for the low voltage in a certain district. One of the major criticisms related to contracts for the laying of cables. It was stated that a company had charged 4s. a yard for laying cables for a period of 10 years. Upon a recent occasion tenders were invited and one was accepted for 1s. 10½d. per yard. The mover of the resolution considered that the disparity between the prices should be investigated.

Moray.—Electricity Supply.—The exclusion of the North of Scotland from the Government's electricity scheme was recently discussed by the County Council, and it was decided to join Banff and Inverness in pressing for the extension of an electricity supply to the area north of Aberdeen.

Palestine.—Rutenberg Concession.—According to the Jerusalem correspondent of the *Daily Express*, the five years' negotiations over the Rutenberg scheme were completed on March 5th, when Lord Plumer, the High Commissioner, signed a £2,000,000 concession for the utilisation of the 600-ft. waterfall on the River Jordan for the generation of electricity and the irrigation of the Jordan basin. The original agreement, which was concluded in 1921, expired in 1923. Mr. Rutenberg then began negotiations with the Colonial Office and the High Commissioner for the renewal of the agreement. This has involved important changes, including the extension of the concessionnaire's rights in Transjordania.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

London.—*St. James' & Pall Mall Electric Light Co., Ltd.*—Lighting: First 4,000 kWh per annum, 5d. per kWh; all energy in excess of this amount, 4d. per kWh; minimum charge of 10s. per quarter. Power: A fixed quarterly charge of 7s. 6d. per rated h.p. and 1d. per kWh for electricity consumed. Heating: 1d. per kWh.

Reigate.—Lighting: From 7d. to 6½d. per kWh. Power, heating and cooking: From 2½d. to 2d. per kWh.

Carlisle.—The percentage increase on the pre-war rates for lighting from 60 to 45 per cent.

Winchester.—Cooking, heating, and other domestic purposes during the spring and summer months: From 1¾d. to 1d. per kWh.

Ripon.—Electricity Supply.—At a recent meeting of the Electricity Committee a letter was received from the Electrical Distribution of Yorkshire, Ltd., stating that it proposed applying for a Special Order authorising it to distribute electricity in Ripon in conjunction with a scheme for the supply of electricity in neighbouring districts. The Committee decided to recommend the Corporation to proceed forthwith with an application for an Order empowering the Corporation (or any undertakers to whom it may lease such powers) to supply and distribute electricity within the city and adjoining parishes.

Sheffield.—Mains Extensions.—The Electric Supply Committee has during the past month approved extensions of mains for general distribution purposes, at an estimated cost of £22,518.

South Africa.—Linking-up Scheme.—The *African World* reports that the Cape, Durban, and Rand electricity supply systems will be the starting points for a system of interconnected power stations throughout South Africa. According to Dr. Van der Bijl, chairman of the Electricity Supply Commission, important developments are projected for supplying power to the Valley as far as Worcester, and large extensions are contemplated for Durban which will ultimately link up with the Colenso power station.

South Kirkby.—Electricity Scheme.—The Carlton Main Colliery Co. is preparing a scheme for supplying South Kirkby with electricity, and is considering the possibility of furnishing a supply to the parishes of Great Houghton and Shafton.

Special Orders.—Application has been made to the Electricity Commissioners for Special Orders by the following authorities:—The Auckland Rural District Council for the supply of electricity in the township of Witton-le-Wear, and authorising the Council to purchase electricity in bulk; Stepney Borough Council for the purchase of land and the erection of a transformer station; the Yarmouth (Isle of Wight) Electricity Supply Co., Ltd., for the supply of electricity in certain parts of the rural district of the Isle of Wight.

Stockton-on-Tees.—Loan Sanctioned.—The Town Council has received sanction to a loan of £5,000 for installing electricity in private houses on the instalment system.

Stoke.—Electricity Extensions.—The Electricity Committee has decided to lay a main at a cost of £1,000 in connection with the supply of electricity to the new telephone exchange in Scotia Road, Burslem.

The electrical engineer has reported upon additions to the distributing system which will be necessary to maintain a satisfactory supply to Tunstall, and has submitted a scheme involving an expenditure of £9,500. A site has been obtained in the Tunstall area for the erection of a sub-station. The committee has obtained sanction to a loan of £11,500 for mains and sub-station equipment.

United States.—Electrical Development.—According to *Power*, the total annual output of electricity by public-utility power plants in 1925 was 65,801,000,000 kWh, an increase of 11.5 per cent. over the output for 1924. Of this quantity, about 34 per cent. was produced by the use of water power, a slight increase over the percentage for 1924. The gain in efficiency in the use of fuel continued in 1925, there being a decrease of about 0.1 lb. in the average consumption of coal per kWh, as compared with the rate of 1924.

West Ham.—Electricity in Bulk.—The Town Council has applied for a Special Order authorising it to supply electricity in bulk to East Ham and Ilford.

Worcester.—Electricity Extensions.—The Corporation Electricity Committee has recommended to the Council that the following works be carried out:—Sub-station in Queen Street, £2,500. Foundations, platforms, alterations and extensions to the circulating water piping and cable work in connection with the turbo-alternator, £4,742. Excavations and building work for the completion of boilers, dampers, steel chimney, steam pipes, and pulverised fuel milling plant, £13,000.

York.—Loan Sanctioned.—The Electricity Committee has received sanction to a loan of £15,000 for feeder cables.

Tramway and Railway Notes.

Continental.—France.—Plans have been prepared for the electrification of the steam-operated local lines of the Société des Voies Ferrées des Landes (about 200 miles), and of the Compagnie des Tramways à Vapeur de la Chalosse et du Bearn (about 90 miles) in the Department of Landes. It is proposed that a rural electricity supply system shall be included in the scheme and to this end that the masts carrying the 1,500-V line for railway traction purposes shall also carry a 10,000 or 20,000-V three-phase line to feed transformer sub-stations in the various communes on the route traversed.

Belgium.—The 1926 Budget of the Belgian Ministry of Railways and Electricity includes a sum of 1,200,000 fr. for the installation of electric lighting in the German railway carriages running on the Belgian State railways and a sum of 14 million fr. for the extension of the electric lighting and power installations at all the principal railway stations on the system.

Portugal.—A concession has been granted by the Municipality of Lisbon to a group of Spanish financiers for the construction of a metropolitan underground railway, the plans for which have been drawn up by Spanish engineers. The enterprise includes the construction of eight lines. Vignole rails, 18 metres in length, will be used, and the lines will have a gauge of 1.44 metres. The total cost of the scheme is estimated at 128,000,000 pesetas.—*Reuter's Trade Service* (Lisbon).

Switzerland.—The first section of the Lausanne-Berne railway to be electrified is that between Lausanne and Palezieux, on which electric trains are now running. The necessary power is being supplied from the Puidoux transformer station where two 5,000-kVA, 60,000/15,000-V transformers are installed.

Bavaria.—According to *Modern Transport* the Munich administration of the Reichs Railways has issued the details relative to the electrification of the railways in Bavaria. The following lines were completed and included in the electrical service during 1925: Munich-Garmisch, Tutzing-Kochel, Munich-Herrsching; Weilheim-Peissenberg, and Munich-Landshut, increasing the system under electrification by 172¾ miles. It is proposed during the present year to finish the work on the Landshut-Regensburg line and push forward the conversion of the Munich-Kufstein track in order that a portion may be working before the end of the year.

Huddersfield.—Omnibus Dispute.—There has been a dispute between the Corporation, on behalf of the borough tramways and a motor 'bus company, with regard to rights of running passenger motor 'buses on the Bradley, Ravensthorpe and Dewsbury route, and an inquiry into the respective applications for running powers was held by the Ministry of Transport recently. The Corporation claimed exclusive rights, but the Ministry has now intimated that both concerns have equal rights, and an Order has been made accordingly.

Irish Free State.—Dublin.—A proposal has been made that when the extension of the Dublin United (Electric) Tramway Co.'s lines to Lucan is commenced, a clause should be included in the Parliamentary Act for extension to Leixlip. This would give a direct route to the central portion of Dublin, covering, in the main, the route of the old Lucan-Dublin Electric Railway recently closed down. The proposal has been supported by a memorial to the Tramways Company from the inhabitants of the Leixlip district. Meantime the Extension Bill is being delayed by the attitude of some of the Dublin townships which have not given their consent to the extension of the period of optional purchase by public authorities of the tramway system as arranged between the company and the City Commissioners.

London.—Waterloo Station Reconstruction.—In view of the heavy traffic which will have to be dealt with at Waterloo tube station in the future, considerable improvements are to be made to provide for the free and rapid movement of the traffic. Contracts have been placed, and work is now in hand. Three escalators of the comb type will supplement the existing lifts. The work at the lower landing of the escalators will include the construction of new footbridges, passages and staircases leading to the new Waterloo station of the Hampstead railway, and connections to the existing passages leading to the Waterloo station of the Bakerloo railway. At the upper level of the escalators there will be a booking hall 52 ft. wide which will be provided with passimeters.

Nottingham.—New Depot.—The Town Council has approved a scheme for the erection of a new central depôt in the Cartergate area for the accommodation of tramcars, 'buses, railless cars, offices; &c., at a cost of approximately £102,000.

Preston.—Tramway Renewals.—The Tramways Committee has recommended to the Town Council the renewal of permanent way at a cost of £4,900, and tramcar renewals at a cost of £3,920.

Sunderland.—Tramway Improvements.—The Corporation is to construct new tramway crossings at the north end of the railway station, and lay a new junction from High Street into Bridge Street, at an estimated cost of £4,500.

Uruguay.—Montevideo.—According to the *Bank of London and South America Monthly Review* there is a scheme on foot to electrify the railway running from Montevideo to the village of Santiago, Vazquez, and preliminary trials have been made, in conjunction with the Compañia de Tranvias La Transatlántica.

Worcester.—Purchase of Undertaking.—A sub-committee has recommended to the City Council that, subject to the approval of the Ministry of Transport, the tramway undertaking of the Worcester Electric Traction Co., Ltd., shall be purchased at a cost of £58,000.

Telegraph and Telephone Notes.

China.—Telephone Agreement.—According to the Shanghai British Chamber of Commerce *Journal*, an agreement has been concluded with the Chinese Government Telephone Administration and the Shanghai Mutual Telephone Co., Ltd., for intercommunication between their respective subscribers.

Hull Telephone Service.—New Sub-station.—The Municipal Telephone Committee has acquired a site in Somerset Road, for the erection of a sub-station.

The Telephone Service.—Street Kiosks.—The erection in London streets of a new type of telephone kiosk is, the Press Association learns, under consideration by the G.P.O. The kiosks are to be a little bigger than the present type, and will include a pillar-box and stamp machine.

Mexico.—Telegraph Service.—The Western Union Telegraph Co. announces that its vice-president, Mr. J. C. Willver, who is in Mexico City, has concluded a contract with the Mexican Government for the introduction of a modern telegraph service in Mexico. According to the *Financial News*, this will mean the ending of the monopolistic system and the opening of a way for other companies. The service will be extended southward through "all America cables." The agreement is subject to the approval of Senor Calles and the boards of the Western Union and Mexican companies.

Transatlantic Telephony.—Two-way Demonstration.—On Sunday afternoon, March 7th, the Post Office Engineering Department successfully demonstrated the possibility of two-way radio-telephony across the Atlantic Ocean, when Press representatives in London and New York were given an opportunity of conversing with each other. By means of a repeater installed within the London Telephone Trunk Exchange the voice is conveyed by land lines to the radio transmitting station at Rugby, whence it is wirelessed across the Atlantic to a receiving station at Houlton, 600 miles distant from New York; thence by land lines it passes through repeater stations to New York City's telephone terminal. The return transmission from America is *via* land lines to Rocky Point, Long Island, 70 miles from New York, then by radio across the ocean to the Wroughton receiving station, near Swindon, and thence by ordinary telephone circuit over 90 miles to London. The wave-length used from this side is 5,770 metres, that from America is 5,260 metres, and the power used at each end is about 200 kW.

Radio Notes.

Broadcasting Committee.—Cabinet Consideration.—The report of the Broadcasting Committee, which is summarised elsewhere in this issue and is now under the consideration of the Postmaster-General, will be brought before the Cabinet immediately with a view to deciding whether legislation should be introduced to give effect to its recommendations. It appears that the new method of controlling broadcasting advocated by the committee has already been accepted by the Government in principle, but while the view has been advanced in some quarters that the new Board of Control could be set up without recourse to a Parliamentary Bill, it is stated in the *Daily Mail* that that view is not shared by Ministers.

Copyright.—B.B.C. Injunction.—The B.B.C., as owners of the copyright of the *Radio Times*, were, on March 4th, in the Chancery Court, granted an injunction, with costs, against the Wireless League Gazette Publishing Co., Ltd., restraining it from publishing wireless programmes taken from the *Radio Times*.

Storm Damage.—Service Interrupted.—A return to winter weather, with high wind, snow, and lightning, was experienced last week. On March 3rd the Daventry station closed down for some minutes from 10.14 p.m., and on the 4th the London station's transmission was temporarily interrupted from 4.30 to 6.30 p.m. on account of the electrical storm. The fault is reported to have been located in the power line, and the old aerial at Marconi House had to be requisitioned for use during the remainder of the evening. The Manchester station also apparently closed down for a time.

Wave-length.—Readjustment.—On March 4th, the Dundee and Liverpool relay stations of the B.B.C. exchanged places in the broadcast wave band. The Dundee station is now working on 315 metres and Liverpool on 331. The effect of this change is to create a greater margin between the two adjacent Scottish stations, Edinburgh (328 metres) and Dundee; also to remove Liverpool farther from the shipping wave-length (300 metres).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Argentina.—Buenos Aires.—April 12th. Public Works Department. Rock drilling installation, including steam shovel, aerial transporters, 170-h.p. electric generating plant, &c.*

May 3rd. Electric travelling crane, capacity 1½ metric tons.*

Australia.—Brisbane.—August 27th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator and two water-tube boilers, with economisers, draught plant, &c. Specifications (£5 5s.) from the offices of the company, Boundary Street, Brisbane.

Ayrshire, Kilmarnock.—Ayrshire County Council. Electric lighting work in connection with the housing scheme. Mr. D. R. Sturrock, district clerk, Kilmarnock.

Belfast.—April 3rd. Electricity Department. One 1,000-kW rotary converter, with transformer, l.p., a.c. switchgear, &c. (See this issue.)

Brazil.—Rio Grande do Sul.—April 15th. Port and Bar Management. 10 electrically-operated portal cranes, capacity 2,500 kilos; 2 ditto, 5,000 kilos capacity; and 7 electric winches or capstans.*

Cardiff.—March 22nd. Electricity Department. Grit-collecting plant, 100-kW, 400-V alternator, &c. (March 5th.)

Croydon.—March 17th. Board of Guardians. Six months' supply of electrical fittings and sundries. Forms of tender from the Union Offices, Mayday Road, Thornton Heath.

Dublin.—Dublin City Commissioners. Wiring for electric lighting at 230 houses at Croydon Park and 218 houses at Kehoe Square. City Architect, Lord Edward Street, Dublin.
E.h.p. switchgear and accessories for Pigeon House and Fleet Street stations. City Electrical Engineer, Fleet Street, Dublin.

East Ham.—March 15th. Electric Lighting and Tramways Department. Cable, bifurcating boxes, and joint boxes. (February 26th.)

Edinburgh.—April 12th. Electricity Department. Four water-tube boilers, economisers, and mechanical stokers or alternatively, boilers, economisers, air heaters, and mechanical stokers or boilers, economisers and powdered fuel plant. (See this issue.)
Education Authority. Electrical work at additions to Balgour Place School. Mr. John Stewart, executive officer, Education Offices, Edinburgh.

Egypt.—Cairo.—April 27th. Egyptian Government. 1,100 desk telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1.—*Reuter's Trade Service* (Cairo).

Galston.—March 15th. Town Council. Electric lighting installation at 52 houses. Messrs. J. Hay & Steel, architects, Kilmarnock.

Grimsby.—March 29th. Electricity Department. One 2,000-kW converter, one 1,000-kW ditto, l.p. switchgear, cable work, &c. (March 5th.)

Hull.—March 18th. Electricity Department. Static transformers and motor converters. (March 5th.)
Telephones Committee. Supply of lead-covered cable and r.c. wire. (See this issue.)

India.—March 30th. India Store Department. Complete equipment for one rotary-converter sub-station, three separate rotary-converter sets and track sectioning switchgear for the G.I.P. Railway electrification. (February 26th.)
March 19th. Inert electric cells, "S" pattern. (March 5th.)
March 24th. 30-line automatic and 10-line manual telephone equipment. (See this issue.)
April 19th. Goods lifts for the Imperial Record Offices at Raisina, Delhi. (A.X. 2,904)*
April 2nd. Cable. (March 5th.)
April 23rd. Electrical equipment for 15 motor coaches and 42 trailer coaches. (March 5th.)
April 13th. 23 electric passenger locomotives. (February 26th.)
May 7th. 15 motor-coach underframes and bodies, 30 motor bogie trucks. (See this issue.)

Kettering.—March 23rd. Electricity Department. Transformers, e.h.p. and l.p. switchgear, one 1,500-kW rotary-converter equipment, and one steam turbo-boiler feed pump. (February 26th.)

Leyton.—April 9th. Education Committee. Installation of electric lighting and central heating at the Sybourn Street new school. (See this issue.)

London.—London County Council.—March 23rd. Wiring and fittings for electric lighting at St. Paul's Road elementary school, Bow. E. (March 5th.)
Bethnal Green.—March 16th. Board of Guardians. Installation of electric lighting in the office extension at Bishop's Road, N.E., and rewiring of the existing building. (March 5th.)
Metropolitan Asylums Board.—March 24th. Installation of electric lighting at the Southern (Lower) Hospital, Dartford. (March 5th.)
Islington.—March 16th. St. Mary's Board of Guardians. Electrical supplies for six months. Forms of tender from Mr. A. King, Guardians' School, Hornsey Road, N.
March 29th. Borough Council. Two 3½-ton electric refuse-collecting vehicles fitted with steel tipping bodies. (See this issue.)

Manchester. — March 22nd. Electricity Department. 3-phase, 420-V sub-station switchgear, 3-phase, 6,600-V and 11,000-V ditto, three 500-kVA static transformers, and one 7,500-kVA forced-air-cooled transformer. (February 19th.)
March 22nd. One 5-ton electric tipping wagon and one 10-ton electric tractor with trailer. (February 26th.)
April 6th. 3-phase, 6,600-V, sub-station switchgear. (See this issue.)
Province of East Lancashire. Wiring, &c., Masonic Temple, Manchester. (See this issue.)

Midlothian.—March 15th. Education Authority. Electric light installation at extensions of Fisherrow School, Musselburgh. Mr. A. L. Fletcher, executive officer, County Education Offices, 9, Drumsheugh Gardens, Edinburgh.

Mountain Ash.—March 22nd. Electricity Department. Two 500-kVA transformers. (March 5th.)

Newark-upon-Trent.—March 16th. Electricity Department. Medium and l.p. switchgear and accessories. (February 26th.)

Newcastle-on-Tyne.—March 19th. Board of Guardians. Lighting installation and the installation of a lift at the nurses' home. Specifications from Messrs. Harrison & Ash, 22, Ellison Place, Newcastle-on-Tyne.

Newcastle-under-Lyme.—March 16th. Electricity Supply Department. 2,300 yd. single l.p. cable and 800 yd. single l.p. cable. (March 5th.)

Otley.—March 30th. Wharfedale Isolation Hospital Committee. Electrical installation at the Isolation Hospital, Menston. (March 5th.)

Portsmouth.—March 17th. Board of Guardians. Three months' supply of electrical stores and lamps. Forms of tender from the Guardians' Offices, St. Michael's Road, Portsmouth.
Electricity Supply Department. Erection of a steel-framed turbine house. (February 19th.)

Preston.—March 12th. Electricity Department. Steelwork in connection with foundations for a turbo-generator at Ribble power station. Specifications from Mr. J. A. Robertson, consulting engineer, 20, Brazennose Street, Manchester.

Pentre, Rhondda.—March 27th. Rhondda U.D.C. Electricity Department. 12 months' supply of house-service a.c. ordinary and prepayment meters, cable, joint boxes, compound, cut-outs, &c. (March 5th.)

Rochdale.—March 16th. Gas and Electricity Committee. One 1,250-kW (or alternatively 1,500-kW) rotary-converter equipment, including transformer and switchgear. (February 26th.)

Roxburgh.—March 15th. Electrician's work required in extension of Grammar School. Schedules from Messrs. Reid and Forbes, architects, 7, Ainslie Place, Edinburgh.

South Africa.—Johannesburg.—April 12th. S.A. Railways and Harbours. Electrification of Cape Town Suburban Railway. Supply and erection of the overhead equipment of the permanent way and overhead transmission and distribution lines. (February 12th.)
May 6th. Two electric goods lifts.*

Spain.—The Junta de Obras of the Port of Tarragona invites tenders for the supply of two 3-ton electric cranes.—*Reuter's Trade Service* (Madrid).

Sutton Coldfield.—March 24th. Electricity Department. E.h.p. underground mains, distributors, feeder pillars, and network fuse boxes. (March 5th.)

Tynemouth. — March 15. Electricity Department. One 250-kVA transformer. (February 26th.)

Walthamstow.—March 24th. Electricity Department. 12 months' supply of l.p. cables and v.i.r. wires. (See this issue.)
April 13th. Electricity Department. Steel overhead bunkers and boiler-house buildings; and coal- and ash-conveying plant. (See this issue.)

Warrington.—March 15th. Electricity and Tramways Committee. Motors and transformers. (February 26th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Bath.—Electric Lighting Committee. Recommended:—
Boiler and economiser (£5,963) and mechanical stoker (£1,562).—Babcock and Wilcox, Ltd.
Two sets of 1,000-kVA Scott-connected transformers and two 6,600/11,500-volt, three-phase transformers (£2,466).—Hackbridge Electric Construction Co., Ltd.
Economisers (£1,778).—Green & Sons.

Blackpool.—Tramways Committee. Accepted:—
Supply of electrical equipment for six new saloon cars and six "toast-rack" cars.—British Thomson-Houston Co., Ltd.

Cardiff.—According to the *South Wales Echo*, fourteen tenders were recently received by the Electricity Committee for a supply of low-pressure paper-insulated cables, and discussion arose as to whether the contract should be sent abroad, as the three lowest were from foreign firms—Belgian, Italian and German. After reviewing the whole of the circumstances the committee unanimously recommended the acceptance of the tender of the Belgian firm, the Ateliers de Constructions Electriques de Charleroi at £8,818, which was £2,188 below the lowest British tender.

Chesterfield.—Electricity Committee. Accepted:—
E.h.p. switch cubicle (£105).—British Thomson-Houston Co., Ltd.
2- and 3-core cable (£755).—Standard Telephones & Cables, Ltd.
4-core cable (£565).—Macintosh Cable Co., Ltd.

Doncaster.—Town Council. Accepted:—
L.p. cable (£1,427).—Enfield Cable Works, Ltd.

Faversham.—Town Council. Accepted:—
Cables (£1,100).—W. T. Henley's Telegraph Works Co., Ltd. The tenders received ranged from £1,308 to £814, the two lowest being for cables of foreign manufacture. W. T. Henley's Telegraph Works Co., Ltd., as the result of negotiations, reduced their original tender of £1,193 to £1,100 net.

Forres.—Managers of Leanchoil Hospital. Accepted:—
Installation of electric lighting in hospital (£732).—Claud Hamilton, Ltd.

Glasgow.—Statute Labour Committee. Accepted:—
Electrical installation at Stockwell Street buildings (£1,592).—James Laird & Co.

Tramways Committee. Accepted:—
Cable (v.i.r. and cab tire).—Standard Telephones & Cables, Ltd.
Copper trolley wire.—Thomas Bolton & Sons, Ltd.

Halesowen.—Accepted:—
Installing electric light at the new model factory at Hunnington, for Henry Vincent, Ltd.—Mr. B. French.

Hull.—Telephones Committee.
C.b. table instruments and dials:—

International Electric Co., Ltd.	£749
Sterling Telephone & Electric Co., Ltd.	514
Automatic Telephone Manufacturing Co., Ltd.	514
Standard Telephones & Cables, Ltd	540
Siemens Bros. & Co., Ltd.	515
Peel-Conner Telephone Works. (Accepted.)	**499**

H.m. cords:—

British L. M. Ericsson Mfg. Co., Ltd. (Accepted.)	**81**

Irish Free State.—DUBLIN.—The following contracts were among those placed by the Controller of Stores, Department of Posts and Telegraphs, during the month January 23rd to February 22nd, inclusive:—
Cable suspenders.—Sparton Mfg. Co., Ltd.
Electrical protecting apparatus.—Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.
Indicators.—British L.M. Ericsson Mfg. Co., Ltd.; International Electric Works, Ltd.
Insulators.—W. J. Kellie; Harwell, Ltd.; and Litholite Insulators, Ltd.
Telephone keys.—Sterling Telephone & Electric Co., Ltd.
Relays.—Sterling Telephone & Electric Co., Ltd.
Stay rods.—T. W. Lench, Ltd.
Telephone cabinets and receivers.—Siemens Bros. & Co., Ltd.
Telephone mouthpieces.—North British Rubber Co., Ltd.; Siemens Bros. and Co., Ltd.
Zinc rod and strip.—London Zinc Mills, Ltd.
—*Irish Builder and Engineer.*

London.—METROPOLITAN ASYLUMS BOARD.—Works Committee.
Installation of automatic telephones at the Downs Hospital for Children:—

Buchanan & Curwen. (Recommended.)	**£934**
V. G. Middleton & Co., Ltd.	1,020
Riddle & Goddard, Ltd.	1,033
Toy & Winslow	1,075
G. E. Taylor & Co.	1,105
T. Clark & Co., Ltd.	1,200

Electric lighting installation at Southern (Upper) Hospital:

Kershaws	£7,576
Read & Partners, Ltd. (Recommended.)	**7,865**
T. Clarke & Co., Ltd.	8,760
Brightside Foundry & Engineering Co., Ltd.	8,975
Douglas Electric Light & Power Co.	8,987
Coley & Swinnerton, Ltd.	9,450
H. B. Giles	10,221
S. Dixon & Son, Ltd.	10,722
Taylor & Allen, Ltd.	10,790

Electric lighting installation at Joyce Green Hospital:—

Douglas Electric Light & Power Co. (Recommended.) ...	**£9,997**
L. G. Tate & Co., Ltd.	10,800
T. Clarke & Co., Ltd.	11,000
Kershaws	11,418
Read & Partners, Ltd.	11,703
Brightside Foundry & Engineering Co., Ltd.	11,985
Coley & Swinnerton, Ltd.	12,200
Higginbotham & Sons	12,200
S. Dixon & Son, Ltd.	12,408
H. B. Giles	12,704
A. S. Goodwin & Co.	13,700

Fire alarm system at Tooting Bec Hospital:—

Riddle & Goddard, Ltd. (Withdrawn.)	£328
V. G. Middleton & Co., Ltd. (Recommended.)	**397**
T. Clarke & Co., Ltd.	395
Toy & Winslow	415
W. H. Agar	435
G. E. Taylor & Co.	440
Buchanan & Curwen	500

HACKNEY.—Electricity Committee. Recommended:—
Additional stand-by cooler unit and pump (£760).—C. A. Parsons & Co., Ltd.
E.h.p. switchgear for the works sub-station main power house switchboard (£1,037), works sub-station e.h.p. switchboard (£1,050), reactances (£1,162).—A. Reyrolle & Co., Ltd.

HAMMERSMITH.—Electricity Committee. Recommended:—
150 yd. .2 sq. in. 3-core, 250 yd. .5 sq. in. concentric, and 2,000 yd. .25 sq. in. concentric cable (£1,816).—Macintosh Cable Co., Ltd.
Annual Contracts recommended:—
Insulating compound.—Dussek Bitumen Co., Ltd.
L.p. cables.—Macintosh Cable Co., Ltd.
Electrical goods.—Falk, Stadelmann & Co., Ltd.
Insulated wires.—W. Geipel & Co.
Joint boxes, &c.—Sykes & Dyson, Ltd.
Meters.—Chamberlain & Hookham, Ltd.

Norwich.—The Corporation has placed an order with Richard Garrett & Sons, Ltd., for a further eight 3½-ton electric refuse-collecting vehicles.

Oldbury.—Urban Council. Accepted:—
Stand-by motor for the vertical retort plant at the gas works (£71).—Electromotors, Ltd.

Peterborough.—The Town Council has placed with Messrs. Peter Brotherhood, Ltd., of Peterborough, a contract for the supply of electrical machinery for the power station extensions at £28,518. Two Continental tenders, which were about £6,000 less, were rejected.

Ripon.—CORRECTION.—Messrs. Cox-Walkers were successful in securing the contract for the electrical installation for the Board of Guardians (see ELEC. REV., March 5th, p. 380), not Messrs. Cox-Walker & Partners. The two firms are separate concerns.

Salford.—With further reference to the note on page 380 (ELEC. REV., March 5th), the Town Council on Wednesday last week, after a long discussion, accepted the tender of the Nederlandsche Kabelfabriek, of Delft, Holland, for the supply of 4,500 yd. of l.p. cable of varying sizes to British standard specification, at £1,497. Alderman Billington, chairman of the Electricity Committee, in moving the adoption of the recommendation of the Electricity Committee, said the same firm had previously contracted to the satisfaction of the Corporation, and the price was £405 less than the lowest of a "non-ring" firm; on a previous contract a saving of £700 was effected. An amendment to refer the resolution back was supported only by 5 votes against 19, and the original motion was carried.

Sunderland.—Corporation. Accepted:—
Tower wagon and charging plant (£380).—Sunderland and District Transport Co., Ltd.

Taf Fechan.—Water Board. Accepted:—
Turbines and generators for high level supplies (£1,454).—James Gordon and Co., Ltd.

Watford.—Electricity Committee. Recommended:—
Two transformers (£708).—Metropolitan-Vickers Electrical Co., Ltd.
Air filter (£401).—Brush Electrical Engineering Co., Ltd.
Stokers, &c. (£3,910), air heaters (£2,500).—Underfeed Stoker Co., Ltd.
Switchgear (£250).—Plumtree & Co.
Two e.h.p. cubicles (£396).—Metropolitan-Vickers Electrical Co., Ltd.

Forthcoming Events.

National Association of Supervising Electricians (Manchester District Branch).—Friday, March 12th. At the Y.M.C.A. Buildings, Peter Street, Manchester. At 7.30 p.m. Lecture on "Electric Driving of Textile Factories," by Mr. E. Preece.

Birmingham Electric Club.—Friday, March 12th. At the Grand Hotel, Birmingham. At 7 p.m. Annual dinner.

Royal Institution.—Friday, March 12th. At 21, Albemarle Street, W. At 9 p.m. Lecture on "Radiation from Electric Discharges," by Sir J. J. Thomson.
Saturday, March 13th. At 3 p.m. Lecture on "The Rare Gases of the Atmosphere," by Sir E. Rutherford.
Tuesday, March 16th. At 5.15 p.m. Lecture on "The Growth of Crystals," by Prof. C. H. Desch.

Association of Mining Electrical Engineers (London Branch).—Saturday, March 13th. Visit to Chislett Colliery, at the invitation of Mr. J. W. Robinson. Paper, "Some Notes on the Electrical Plant at Chislett Colliery," by Mr. C. Dawson.

Royal Society of Arts.—Monday, March 15th. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture on "Thermometry," by Mr. W. F. Higgins.
Wednesday, March 17th. At 8 p.m. Lecture on "Co-partnership," by Lt.-Col. J. H. Boraston, C.B.

Nottingham Society of Engineers.—Monday, March 15th. At the Technical College, Derby. At 7.30 p.m. Joint meeting with the Derby Society. Paper on "Some Considerations Relating to Electricity Supply," by Mr. A. D. Phillips.

Paisley Association of Electrical Engineers.—Tuesday, March 16th. At 16, High Street, Paisley. At 7.30 p.m. Apprentice papers.

Edinburgh Electrical Society.—Wednesday, March 17th. At the Royal Society of Arts, 117, George Street. At 8 p.m. Paper on "Organisation," by Mr. P. J. Sims.

Batti-Wallahs.—Wednesday, March 17th. At the Hotel Victoria, W.C. At 7 for 7.30 p.m. Annual dinner.

Institution of Electrical Engineers.—Thursday, March 18th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "Developments in High-power Fuses," by Mr. L. C. Grant.
(South Midland Students' Section).—Annual joint meeting with the Students' Sections of the Institution of Civil Engineers and the Institution of Mechanical Engineers. Friday, March 12th. At the Grand Hotel, Birmingham. Discussion on the "Design and Equipment of a Modern Factory," to be opened by Messrs. F. B. Warder, E. T. Hussell, and A. R. Cole.
(Mersey and North Wales (Liverpool) Centre).—Monday, March 15th. At the University, Liverpool. At 7 p.m. Informal discussion on "Electricity on Board Ship," to be opened by Mr. J. E. Allan and Mr. A. G. Barnard.
(North-Eastern Centre).—Monday, March 15th. At Messrs. Sopwith's Lounge, Northumberland Street, Newcastle-on-Tyne. At 7 p.m. Informal discussion on "Power Station Economics."
(North-Western Centre).—Tuesday, March 16th. At the Engineers' Club, Manchester. At 7 p.m. Paper on "Developments in High-power Fuses," by Mr. L. C. Grant. Annual general meeting.
(Sheffield Sub-Centre).—Wednesday, March 17th. At the Mappin Hall, St. George's Square, Sheffield. At 7.30 p.m. Paper on "Permanent Magnets in Theory and Practice," by Mr. S. Evershed.
(Tees-side Sub-Centre).—Monday, March 15th. At the Cleveland Technical Institute, Middlesbrough. At 7.15 p.m. Lecture on "Electro-farming; or the Application of Electricity to Agriculture," by Mr. R. B. Matthews.

British Electrical and Allied Manufacturers' Association.—Thursday, March 18th. At the Connaught Rooms, W. At 1 p.m. Annual luncheon.

British Electrical Development Association.—Friday, March 19th. At the Hotel Cecil, Strand, W.C. At 7 for 7.30 p.m. Annual dinner.

Manchester Electro-Harmonic Society.—Friday, March 19th. At the Albion Hotel, Piccadilly, Manchester. Monthly concert.

Institution of Engineering Inspection.—Friday, March 19th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "Lubricating and Allied Oils," by Mr. E. A. Evans.

City & Guilds of London, Central & Finsbury Engineering Colleges Old Students' Associations (Northern Section).—Friday, March 19th. At the Engineers' Club, Manchester. Annual dinner.

Electrical Power Engineers' Association (London Western Section).—Saturday, March 20th. At Stewart's Restaurant, Victoria Street, S.W. At 7 p.m. Annual dinner.
(Kent Section).—Saturday, March 20th. At Hollingworth Hall Church Institute, Maidstone. At 6 p.m. Lecture on the "Brush-Ljungström Steam Turbine," by Mr. J. R. Hutchings.

Electrical Trades Commercial Travellers' Association.—Saturday, March 20th. At the Manchester Hotel, Aldersgate Street, E.C. At 7.30 p.m. Grand carnival dance.

Notes.

The Batti-Wallahs' Society.—At the annual general meeting, held on the 3rd inst., the following officers were elected for 1926:—President, Mr. A. W. Blake; vice-president, Mr. G. W. Partridge; hon. sec. and treasurer, Mr. M. Whitgift.

Swiss Hydro-Electric Competition.—The municipal authorities of Zurich are organising a premium competition, confined to Swiss engineers, for the best scheme for a dam and hydro-electric power plant in the Limmat.

Registered Contractors.—The following additional applications for registration were accepted by the Executive Committee of the National Register of Electrical Installation Contractors at its meeting held on March 5th :—

Haycraft, C. H., & Son, Ashton-on-Ribble
Doyle, Charles, Gateshead-on-Tyne
Girling, John, & Son, Ashington
Spink, T. H., Headingly, Leeds
Veston Contracts Co., Euston, N.W.1
Dunkley, A. F., Margate
Wilkinson, J. C., Leeds
Smith & Poyner, Leicester
Knight, A. J., Newcastle-on-Tyne
McCullock & Newitt, Leeds
White Bros., Leeds
Hapgood, R., & Co., Pontardawe, Glam
Sproates, H. S., & Co., Middlesbrough
The Electric Service Co., Grimsby
Caffrey, T., Londonderry
Attree, L. G., Bishops Stortford

Fatality.—According to the *Manchester Guardian*, John Horton, aged 10, of Longton, near Preston, received a fatal electric shock at Southport on March 4th. He was playing in a field near a school, of which he was a pupil, when he came into contact with a live wire, one of a number which supply the houses of the district with electricity.

At the inquest at Southport on March 6th it was stated that the cradle of the overhead wire had been dislodged by the gale and had come into contact with the wire, causing it to fall to the ground. Some schoolboys were playing, and Horton apparently gripped the wire. The borough electrical engineer said the wire was protected in accordance with the Board of Trade specifications. A verdict of "Death from misadventure" was returned.

Electric Smelting.—It is reported from Trondhjem that the A. S. Norsk Staal (Norwegian Steel Co.), which has been engaged on experiments with the method devised by Mr. Emil Edwin for the electrical production of steel, has proceeded so far that trial working on a larger scale is expected to be undertaken. The company has fixed on Glomfjord as a suitable site for the establishment of the proposed new plant, and an application has already been made to the State hydro-electric administration for the supply of 6,000 h.p.

Local Societies.—A party consisting of over 100 members of the Nottingham and Derby Societies of Engineers visited the Witton Engineering Works of the General Electric Co., on February 25th. The members were welcomed by Dr. A. H. Gailing, the works director, and were entertained to luncheon at the G.E.C. Magnet Club.

London Traffic Signals.—According to *Modern Transport*, the Westinghouse Brake and Saxby Signal Co., Ltd., has been authorised by the Ministry of Transport to provide eight three-aspect coloured light traffic signals for the regulation of traffic along Piccadilly from east and west, and entering Piccadilly from the north by Berkeley Street, Dover Street, Albemarle Street, and Old Bond Street, and from the south by Arlington Street, and St. James's Street. A signal will be placed at the corner of each of the above-named streets to control the traffic entering Piccadilly, while the signals in Piccadilly for east and west traffic will be placed near the entrances from Old Bond Street and Berkeley Street respectively. The aspects displayed will be red for "halt," green for "proceed," and yellow, the latter bridging momentarily the period between "halt" and "proceed" to allow for slowing down or getting ready to move, as the case may be. These signals will be operated from a central control point situated in Piccadilly opposite the end of St. James's Street.

Boiler Explosion Report.—We have received a copy of the report of the preliminary inquiry held on the explosion from the water-screen of a boiler fired with pulverised fuel at the Prince's Generating Station, Birmingham. The boiler and screen are of the Vickers Boiler Company's make. The second tube from the left-hand side in the water screen inside the rear wall of the combustion chamber was ruptured for a length of about 12 in. and the explosion was due to the overheating of the tube, caused, it is thought, by shortness of water. All the other tubes in the screen showed signs of having been overheated. No material damage was caused by the explosion, showing that there was very little potential energy in the boiler at the time. There were five boilers on range at the time of the explosion; four of these are situated in close proximity to the feed pumps and the fifth, the one in which the explosion occurred, is about 200 ft. away. The boiler has an economiser superimposed above it, and, owing to the height of the boiler, the feed inlet is about 20 ft. higher than the inlet to the other boilers. The low-water alarm, which was blowing at the time, did not attract the attention of the engineer-in-charge. In order to sustain the pressure in the feed main, orders have now been given that when any of the boilers of this type are steaming an additional feed pump, which is situated at the same end of the boiler house, is to be used.

A Tibetan Tragedy?—Some months ago we reported that Messrs. Crompton & Co., Ltd., were supplying electrical machinery to Lhasa, the capital of Thibet. The *Daily Mail* states that the party, in charge of a young Tibetan engineer who had received an English education, which was transporting the equipment to the "Forbidden City" was massacred *en route* and the machinery was thrown over a precipice. According to a *Reuter* message from Delhi, however, this report has been authoritatively denied.

Large Diesel Engines at Hamburg.—In the course of the discussion on Mr. Geoffrey Porter's paper on "Heavy-Oil Engine Installations; Choice of Site and Lay-out of Plant," at the recent meeting of the Diesel Engine Users' Association, Mr. W. Roylands Cooper gave some interesting information concerning Diesel engines of large powers. He referred to an engine developing about 4,000 b.h.p. in four cylinders which he had recently inspected at the works of the M.A.N. Company, at Augsburg, and also to the 15,000-brake-horse-power Diesel engine built for the Hamburg electricity supply undertaking by Messrs. Blohm & Voss. It was evident, he said, that Continental engineers were of the opinion that large-sized Diesel units would find a very important use in interlinking schemes, both in connection with large water-power plant and large steam turbine installations. The 10,000-kW set at Hamburg was comparable with the large turbo-generators now in use. It was of great interest, particularly the generator, which was water-cooled and of a special low-speed design. The engine was of the M.A.N., double-acting, two-cycle type, such as had been installed in, and ordered for, several German ships. It was a nine-cylinder set; the overall length of the engine was about 73 ft., and its breadth about 14 ft.; the height from the floor to the top of the valves was about 33 ft. Mr. Roylands Cooper suggested that it would be a matter of importance for the Association to watch very closely the use of this size of set on the Continent and to see if it was not advisable to adopt larger Diesel engines in our schemes of interlinking in this country. British-built engines were now available for large powers.

A Large Electric Cooking Installation.—An interesting installation of electric-cooking equipment, designed for dealing with 150 luncheons daily, has recently been provided at Unity

Electric Cooking Equipment at Unity House.

House, the headquarters of the National Union of Railwaymen. The apparatus includes a double roasting oven, boiling table, and a combined hot-closet and serving table. The internal dimensions of the ovens are 24 in. high, 24 in. deep, and 22½ in. wide; the total loading of each oven is 5 kW, and they are controlled by rotary multiple switches.

The boiling unit dimensions are 5 ft. 6 in. x 2 ft. 6 in. x 2 ft. 9 in. high. This is equipped with six separate 1,600-W elements. The hot closet and serving table is 5ft. long, 2 ft. 6 in. wide and 2 ft. 6 in. high. Two sets of elements, one beneath the lower shelf, and one beneath the hob of the serving table, are separately controlled.

The equipment, supplied by the General Electric Co., Ltd., was installed by Messrs. Burdette & Co., Ltd.

Accident.—An explosion which occurred in the boiler house of the Keswick (Cumberland) electricity works on March 1st caused serious injuries to Thomas White and George Whittle. It is believed that one of the men threw some oil on the furnace and thus caused the explosion. It was customary to dispose of the waste oil from the Diesel plant in this manner, instead of throwing it into the beck, but on this occasion the dampers were closed, and the oil blew out one of the doors of the boiler.

Appointments Vacant.—Deputy transportation superintendent, electric traction section (Rs.1,750 per calendar month) for the Indian State Railways. Power station fitter for the Worcester Corporation Electricity Department. Switchboard attendant (65s.) for Newton Abbot Power Station. (See our advertisement pages to-day.)

Multiple Tariff Electricity Meters.—In a paper read before the Union des Centrales Suisses d'Electricité, M. L. Martinet, electrical engineer, Neuchatel, described the methods adopted by the municipality to increase the energy consumption, by the introduction of tariffs varying in amount according to the period of the day and year, to encourage consumption during the ordinary low-peak hours by lower charges. After considerable research, means were devised for converting the existing meters into multiple-tariff meters by interrupting the shunt circuits by means of suitable central clocks. A 50 per cent. tariff reduction is effected by breaking the shunt circuit for one minute out of every two, proportional time breaks being adopted for other tariff reductions. Several meters in any particular building, street, or section, are dealt with by means of a pilot wire to which the shunts are connected. This system facilitates the rendering of accounts, but it does not give a record of the energy consumed. Although this is considered unimportant, in that it has only a statistical value, a somewhat different form of meter has been introduced, which, while requiring only a single pilot wire, actuates not only the amount-recording dial, but also a relay and mechanism showing the kWh consumed. The two forms of multiple-tariff meter have both been approved by the Swiss Federal Weights and Measures Department. Five different tariffs are in operation on the Neuchatel system. Out of the 10,102 meters installed, over 5,000 are of the multiple-tariff type, and the number is steadily increasing. These are controlled by 1,561 clocks, or an average of about 3 meters per clock.

International Electrotechnical Commission.—New York Meeting.—The list of delegates to the meeting of the International Electrotechnical Commission and the International Conference on Standardisation, to be held next month, is headed by the names of Signor Guido Semenza, President, I.E.C.; Dr. C. O. Mailloux, E.E., Honorary President, I.E.C.; Col. R. E. Crompton, C.B., R.E., Honorary Secretary, I.E.C.; and Mr. C. le Maistre, C.B.E., General Secretary, I.E.C. Seventeen countries will be represented; omitting Canada and the United States, whose representatives' names will be included later, there are 94 names in the list. The following are the British delegates:—President, Sir Richard Glazebrook, K.C.B. (Chairman, British National Committee). Vice-Presidents: Sir Archibald Denny, Bart. (Chairman, British Engineering Standards Association); Mr. L. B. Atkinson (Director, Cable Makers' Association); Mr. C. P. Sparks (Vice-Chairman, British National Committee); Mr. S. T. Allen (Municipal Electrical Engineer, Wolverhampton); Mr. E. G. Batt (General Electric Co.); Mr. W. S. Burge (English Electric Co.); Mr. S. B. Donkin (Association of Consulting Engineers); Capt. P. Dunsheath (W. T. Henley's Telegraph Works); Mr. A. R. Everest (British Thomson-Houston Co.); Mr. J. P. Gregory (British Thomson-Houston Co.); Mr. W. Lee (Silvertown Lubricants, Ltd.); Mr. S. W. Melsom (Callender's Cable and Construction Co.); Dr. A. C. Michie (Electrical Research Association); Mr. R. B. Mitchell (President, Incorporated Municipal Electrical Association); Mr. A. P. Mossay (Electric Vehicle Committee of the U.K.); Mr. J. S. Peck (Metropolitan-Vickers Electrical Co.); Mr. C. Rodgers (Secretary, British Electrical and Allied Manufacturers' Association); Mr. T. Roles (Municipal Electrical Engineer, Bradford); Mr. P. F. Rowell (Secretary, Institution of Electrical Engineers); Mr. F. Wallis (English Electric Co.); Lt.-Col. K. Edgcumbe (Everett, Edgcumbe & Co.); Representative of the Railway Companies; Mr. P. Good (Secretary of the British Delegation). The four gentlemen first named will represent the B.E.S.A. at the International Conference on Standardisation to be held in New York on April 17th and 18th.

Large Concrete Pipe.—One of the largest concrete pipes in the world is being laid in the French Alps, and will help to provide power for industrial works at Grenoble. It has an internal diameter of 19 ft. 6 in., and when completed will be nearly a mile in length.—*Financial Times.*

Thermal Expansion of Tungsten.—Scientific paper of the Bureau of Standards, No. 515 (Dept. of Commerce, Washington, U.S.A.), by Messrs. Peter Hidnert and W. T. Sweeney, gives the results of an investigation on the thermal expansion of tungsten (99.98 per cent.). The expansion of tungsten is given by the following empirical equation:

$$L_t = L_0 [1 + (4.28\ t + 0.00058\ t^2)\ 10^{-6}]$$

applicable between − 105 and + 502 deg. C.

The coefficients of expansion increase regularly with temperature. From 0 to 500 deg. C. the average coefficient of expansion is 4.6×10^{-6} per degree.

Telephotography.—The German Wireless Co. (Telefunkengesellschaft) claims to have beaten all speed records in the transmission of wireless photography between American stations and the German station at Nauen. According to the *Manchester Guardian*, it has succeeded in transmitting 15,000 apertures per second, a speed equivalent to the transmission of 25 words per second. This achievement shows progress, as text and diagrams can be transmitted simultaneously with pictures. At the annual dinner of the Institution of Electrical Engineers in London, the president, Mr. R. A. Chattock, remarked that the Marconi Co. had recently transmitted his photograph and signature across the Atlantic Ocean by means of "wireless." Photographs of the Lenglen-Wills lawn tennis match at Cannes were transmitted over the telephone wires from Nice to Paris by means of the Belinograph process.

The Jean Bares Prize.—Among the annual premiums awarded by the French Office National des Recherches Scientifiques et Industrielles is that known as the Jean Bares, which is offered to the inventor "who is the father of at least three children," and who is regarded as having rendered the greatest service to French industry. For 1925, the premium, which amounts to 10,000 fr., has been awarded to M. Vedovelli, who has been responsible for over 100 patents, and has a wide reputation in connection with high-pressure electrical apparatus and control gear. M. Vedovelli was responsible for the electric luminous fountains at the Paris Exhibition of 1900, and for the electric waterfall and other electrical illuminations at the Paris Decorative Arts Exhibition of 1925.

Impact Stress in Granular Materials.—At a recent meeting of the Physical Society of London, the application of the piezo-electric properties of a Rochelle salt crystal and the tri-electrode valve to the determination of impact stresses in granular materials was demonstrated by Messrs. J. J. Hartley, M.Eng., M.Sc., A.M.Inst.C.E., and R. H. Rinaldi. The apparatus employed was designed to utilise the charge of a strained crystal for the measurement of impact stresses in sands. A crystal was shown mounted between two brass plates and initially strained to 15 kilogrammes by means of three springs; this had an impact load of 400 gm. steadily applied to a lever arm which gave the strained crystal a further torsional strain. A negative charge was collected from the tinfoil girdle, about the major axis of the crystal, and was applied to a valve grid, causing a fall in the small steady plate current on a microammeter.

Institution Notes.

Institution of Electrical Engineers.—Sheffield Sub-Centre.—In an address to the Sub-Centre, Mr. R. A. Chattock, the president of the Institution, said that railway electrification still seemed to be hanging fire in this country, apparently due to the apathy, or conservatism, of the railway magnates. The way was already being shown on the Continent; the electrification scheme for the Paris-Orleans Railway, it was specially illuminating to realise, was designed to utilise several sources of power, hydro-electric stations were to work in company with the large steam-driven stations in Paris and elsewhere. This was a proposal that would appear to be very highly desirable from the point of view of the new Government scheme, as it would undoubtedly have the effect of considerably increasing the load factor and consequently of cheapening the cost of producing electrical energy throughout the country. It was thought, he hoped very wrongly, that railway engineers in this country would not agree to purchase their energy from public supply undertakings, chiefly on the score of reliability and not themselves having control of the stations. Also, so far, no mention had been made of including the supplies to railways in the Government scheme. He hoped that this proposal would not be overlooked when the scheme developed. Referring to the developments taking place in the electricity supply industry, Mr. Chattock said that low-temperature carbonisation of coal was likely to revolutionise boiler-house practice. The Milwaukee Electric Railway and Electric Light Co., in the United States, would soon have a plant at work for skimming the volatiles from pulverised fuel and passing the residue on to the boiler house still in its pulverised form. The results would be watched with the greatest interest, and if such a process could be commercially possible it should be of the greatest value.

Junior Institution of Engineers.—At a special meeting of the above Institution held at the Engineers' Club, Birmingham, on March 5th, a paper on "Lifting and Shifting Machinery," was read by Mr. C. H. Woodfield, M.I.Mech.E. The author described a great many types of electric cranes and showed the advantage of compensated luffing gear. Steel wireless masts 820 feet in height, recently erected by the lecturer in South Africa, were described; the chief difficulty encountered during erection was caused by high winds. A three-storied cage passed up the interior of the triangular mast, being hoisted by a wire rope attached to the engine of a "Ford" car.

In a paper on "Tendencies in Modern Electric Practice," presented by Mr. J. M. Seddon, A.M.I.E.E., several of the latest hydro-electric stations in Sweden were described. It was emphasised that the civil engineering work in connection with these power stations were very costly, and the energy supplied by them to consumers was on the average more expensive than that supplied by the cheaper English companies. Their existence was principally justified by the fact that coal was dear. Steam stations were next discussed with special reference to powdered fuel. The dust and grit which was ejected from the chimneys of powdered-fuel plants presented a difficulty, but special fan arrangements had been devised to overcome this.

In the discussion which followed, the majority of speakers expressed the opinion that there was not much prospect of reducing the cost of electricity by linking up on a large scale, or by any advance in the method of generating which was likely to occur in the near future. The main hope was in improving the load factor by attracting off-peak loads at very low rates, such as water heating through the night. Several Borough Councils now supplied electricity for this purpose at ½d. per kWh.

Institution of Heating and Ventilating Engineers.—In paper read before the above Institution on the design and plication of electric motors relative to heating and venti-ing, Mr. Joseph Meech, A.M.I.E.E., dealt very fully with e design of various types of motors used for fan and pump rk, and the methods of driving, speed control, and attaining ence. He explained how a contractor who had a motor stock could utilise it on a pressure for which it was t primarily designed. The causes of hunting and surging re considered. Mr. Meech concluded with some notes on wer factor and starting and controlling devices, and urged e consideration of the advantages of remote control for tors scattered over a building.

Society of Engineers (Inc.).—On Monday last, Mr. W. M. ckett, M.B.E., read a paper on "Tidal Power on the River vern," giving details of his survey of the site which he nsidered best suited for the construction of a dam across e estuary, and discussing the various methods of utilising al power. His proposals included the installation of 100 rbines, yielding an average output of 150,000 b.h.p. over hours' day load, and 50,000 b.h.p. over 12 hours' night-ad, with a maximum demand of 250,000 b.h.p. The scheme ntemplated the construction of a large storage reservoir the River Augidy, a power house on the River Wye, and tunnel 35 ft. in diameter. Surplus power would be used pump water through the tunnel into the reservoir, which uld drive turbines when those on the Severn were not le to cope with the load. The total cost of the scheme as estimated at 12 million pounds, including about one illion for transmission lines and transformer stations. The t income was estimated at one million pounds per annum.

Institute of Metals.—The Institute has just issued to its embers a ballot paper containing the names of 77 candidates r membership—a record list. This is the last occasion upon hich a postal ballot for the election of members will be ken. In future election to membership will be by the uncil, the first election under the new arrangement being ld on April 21st.

Electrical Association for Women.—On Tuesday last, a rty of members of the Association paid a visit to the Ideal ome Exhibition, where they gave particular attention to e E.D.A.'s "Electric House" and the stands of Messrs. G. Hawkins & Co., Ltd., Freezone, Ltd., Electrolux, Ltd., d other electrical exhibits.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. Leslie Gordon, town clerk of St. Marylebone, having ccepted the unanimous invitation of the Joint Electricity uthority for the London and Home Counties Electricity Dis-ict, established by Parliament last year, to act as clerk, licitor and Parliamentary agent to the Authority, has re-gned his present office, to which he was appointed in 1924. is knowledge of London's electricity problems, the solution which has been entrusted to the Joint Authority, is stated be unique. For many years he acted honorarily as clerk the Conference of Local Authorities Owning Electricity ndertakings in London and the Home Counties, which was rmulated to safeguard and co-ordinate the interests of the uthorities in question.

Mr. J. S. Trelease, assistant technical engineer in the Sal-ord Corporation electricity department, has been appointed lectrical clerk of works to the County of London Electric upply Co. On the occasion of his leaving Salford, he was resented with a mahogany clock by Mr. S. J. Watson, orough electrical engineer, on behalf of the whole of the taff of the department.

The Bradford City Council has approved the following alary increases:—Mr. Thos. Roles, city electrical engineer, rom £1,500 to £1,600 per annum; Mr. J. Fairburn, works uperintendent, from £618 to £695; Mr. C. E. Allsopp, com-ercial assistant, from £618 to £695; Mr. C. A. Gillin, mains ngineer, from £516 to £561; Mr. G. W. Hodsman, chief raughtsman, from £469 to £516; Mr. H. E. Bottom, assist-nt sales engineer, from £316 to £365; Mr. H. Newsham, hemist, from £278 to £312; and Mr. R. H. Wilkinson, tram-ay manager, from £1,000 to £1,100.

Mr. Thos Roles has been authorised by his Committee to ccept an invitation to be one of the delegates to attend, on ehalf of the British Engineering Standards Association, the orthcoming conference in New York with reference to the ormulation of international standards for electrical and other nachinery

On March 1st, Mr. Robert Birkett was entertained to linner by his staff to celebrate his completion of 21 years' ervice as borough electrical engineer of Southend. Mr. A. C. ohnson, assistant electrical engineer, who presided, presented Mr. Birkett with an inscribed gold watch on behalf of the taff.

According to the *Electrical Engineer of Australia*, Mr. M. C. immis, of Messrs. Siemens Bros. & Co., Ltd., Melbourne, was o leave for England at the end of January to take up an important technical appointment in the cable works of his ompany at Woolwich, dealing largely with research work nd new developments in electric cables.

Mr. William Hainsworth, who has been commercial assistant to Mr. C. H. Yeaman, city electrical engineer, for the past six years, is leaving the service of the Stoke-on-Trent Corporation to take up a similar position in the Croydon Electricity Department. He was recently presented with a silver cigarette case by Mr. Yeaman, on behalf of the members of the staff and the department.

The Stoke Corporation Electricity Committee has appointed Mr. T. Lockett as commercial assistant at a salary of £250 per annum, plus bonus, in place of Mr. W. Hainsworth.

The Newcastle-on-Tyne Corporation Transport and Electricity Committee has recommended to the City Council that Mr. Thomas P. Easton be appointed general manager, and Mr. W. T. Dalton, engineer, of the tramways, in place of Mr. E. Hatton, who has just resigned. Mr. Hatton's duties will thus be split, at, it is understood, an increased cost of about £150 a year. Mr. Hatton's salary was £1,650, and under the new scheme the general manager will receive £1,000 and the engineer £800 per annum. Mr. Easton has been with the Corporation for 25 years.

On the unanimous recommendation of its Electricity Committee, the Exeter City Council has resolved that the remuneration of Mr. H. D. Munro, the chief electrical engineer, shall be in accordance with the minimum salary scale of the Associated Municipal Electrical Engineers (Great Britain and Ireland).

The Wimbledon Council has resolved by 20 votes to 4, to increase the salary of Mr. A. E. McKenzie, the borough electrical engineer, from £1,500 to £2,000 per annum, as from April 1st. If the net profits for 1926-27 or any of the following three financial years, exceed £30,000, he is to be paid a bonus of 2½ per cent. on the profits in excess of this figure. We understand that Mr. McKenzie is still free to practise as a consulting engineer.

Ald Sir G. H. Hume, M.P., M.I.E.E., has been elected chairman of the London County Council for the ensuing year.

Mr. T. A. Edison celebrated his 79th birthday on February 11th, at his winter home in Florida.

Mr. Maxwell Webber has been appointed electrical engineer to the Haworth Urban District Council.

Obituary.—Mr. H. Hatfield.—We regret to record the death of Mr. Henry Hatfield, I.S.O., Chief Examiner at the Patent Office for 31 years, from which post he retired six years ago.

Mr. G. Stevenson.—We regret to learn that Mr. George Stevenson, A.M.Inst.C.E., M.I.E.E., assistant sales manager of the Chloride Electrical Storage Co., Ltd., passed away on Sunday last. He became ill while travelling to Bordighera from Paris and died at Mentone station.

New Companies Registered.

Birkbys, Ltd. (212,173).—Private company. Registered March 5th. Capital, £40,000 in £1 shares. Objects: To acquire the business of specialists in synthetic resin insulation carried on at Liversedge, Yorks., and elsewhere, to adopt an agreement with A. T. Birkby and F. E. Birkby, and to carry on the business of electricians, electrical, wireless and mechanical engineers, manufacturers of and dealers in mouldings, moulding powder, resin, varnish, and other articles used in synthetic resin insulation, &c. The first directors are:—A. T. Birkby, The Nook, Liversedge, electrical engineer; F. E. Birkby, Round Oak, Mirfield, electrical engineer (both permanent, subject to holding 5,000 ordinary shares each). Qualification of other directors, 500 shares. Remuneration as fixed by the company. Solicitors: Mumfords & Gordons, 14, Piccadilly, Bradford. Registered office: Woodfield Mills, Liversedge.

Hopkinsons, Ltd. (212,201).—Registered as a public company on March 5th, with a nominal capital of £700,000 in £1 shares (350,000 preference and 350,000 ordinary). The objects are:—To acquire the goodwill of the businesses of manufacturers of and dealers in boilers, boiler flues, mountings and fittings and valves of every description belonging to J. Hopkinson & Co., Ltd., and carried on at Huddersfield and elsewhere; to take over and undertake all or part of the assets and liabilities of those businesses; for that purpose to enter into an agreement with the British Shareholders Trust, Ltd., to carry on in Great Britain or elsewhere, both directly and by means of subsidiary companies all or any of the trades or businesses of mechanical and electrical engineers, machine and engineering tool makers, makers of boilers, mountings and fittings, &c. Minimum cash subscription, 7 shares. The directors are:—R. A. Hopkinson, 36, York Place, Harrogate, manufacturer; E. W. Crammond, 3, Lombard Street, E.C. (director of Platt Bros. and Co., Ltd., and managing director of British Shareholders Trust, Ltd); N. H. Docker, Wootton Courtinay, Taunton, Somerset, and 4, Central Buildings, Westminster (director of John Wilkes, Sons & Mapplebeck, Ltd., and International Combustion, Ltd.); C. J. Hofton, Holme Villas, 10, Holme Road, West Bridgeford, Notts., salesman; P. G. Hopkinson, 12, Cambridge Road, Huddersfield, engineer; Sir William Ramsden, Kt., J.P., Marshfield, Huddersfield, solicitor; R. S. Turnbull, 1, Alwinton Terrace, Gosforth, Newcastle-on-Tyne, salesman. Qualification, £500. Remuneration, £2,400 per annum divided between them. Solicitors: Pinsent & Co., 6, Bennetts Hill, Birmingham.

J. H. Runbaken, Ltd. (212,068).—Private company. Registered March 1st. Capital, £7,500 in 3,800 "A" ordinary shares of £1 each and 74,000 "B" ordinary shares of 1s. each. Objects:—To acquire the business of an electrical engineer carried on by J. H. Runbaken at 30, Tipping Street, Manchester. The permanent directors are:—J. H. Runbaken (managing director), "Maryvale," Hilltop, Wilmslow; C. Lewis, "Roselawn," 68, Chartfield Avenue, Putney; J. C. Maurice, 33, Muswell Hill Road, N. (all permanent, subject to each holding 100 shares). Qualification of directors, 500 shares. Remuneration, £225 each per annum. Solicitors: Woolfe and Woolfe, 13a, Old Burlington Street, W. Registered office: 30, Tipping Street, London Road, Manchester.

Wagner Electric Supplies, Ltd. (212,107).—Private company. Registered March 2nd. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in electrical apparatus, including engines, turbines, generators, motors, transformers, switchboards, cables, meters, fans, lamps, and all devices suitable for electric generating stations, &c. The directors are:—H. C. Walsh, 28, Swinderby Road, Wembley, C.A.; A. Woolley, "St. Andrews," Burford Road, Bickley, accountant. Secretary: D. A. Turner. Solicitor: H. F. Strouts, Monument Station Buildings, E.C.4. Registered office: 49, Eastcheap, E.C.4.

Fordham Electrical Engineering Co., Ltd. (212,016).—Private company. Registered February 26th. Capital, £2,000 in £1 shares. Objects:—To carry on the business of electricians, electrical and mechanical engineers, wireless engineers, &c. The subscribers (each with one share) are:—C. Ashton, 253, Clapham Road, S.W.8, funeral furnisher; Mrs. K. Ashton, 333, Clapham Road, S.W.9. The permanent directors are:—W. Ashton and C. Ashton.

Midland Electric Lamp Co., Ltd. (212,135).—Private company. Registered March 3rd. Capital, £100 in £1 shares. Objects: To carry on the business of electrical engineers, factors and dealers, manufacturers of electrical goods, &c. The first directors are:—S. Swerling, 140, Leicester Road, Higher Broughton, Manchester, cotton goods merchant; M. End, 40, Cramp Street, Higher Broughton, Manchester, lamp factor. Qualification, £1. Secretary: S. Swerling. Solicitor: S. Linder, 7, Brazennose Street, Manchester. Registered office: 5a, St. Peter's Square, Manchester.

Official Returns of Electrical Companies.

Callender's Cable & Construction Co., Ltd. (48,915).—Reverting to the notice published here on February 26th, we should state that since the date of the last annual return (June 11th, 1925), the capital has been increased from £1,300,000 to £1,500,000 in £1 shares. On July 25th, 1925, 100,000 of the new shares (ordinary) were allotted, making the nominal amount of the issued capital £1,400,000 (£600,000 ordinary and £400,000 preference, and £400,000 "B" preference). To June 11th, 1925, £1,025,000 had been paid up in cash, and £275,000 was considered as paid. At July 2nd, 1925, 15s. per share was paid or due and payable on the 100,000 new ordinary shares. We understand that the remaining 5s. per share has been paid up since the date named, making the paid-up capital £1,125,000. Mortgages and charges at June 11th, 1925, £300,000.

Telephone Manufacturing Co., Ltd.—Particulars filed of debentures for a principal sum not in any event exceeding a third of the total secured rentals as defined in the trust deed, together with a premium of 2 per cent., authorised by resolutions of November 29th, 1921, December 16th, 1925, and February 11th, 1926, and having the benefit of a trust deed dated February 17th, 1922, charged on the premises comprised in the said trust deed, the amount of the present issue being £20,000, ranking *pari passu* with £310,000 already registered in accordance with the provisions of the trust deed. Trustees: London City and Midland Executor and Trustee Co., Ltd., 5, Princes Street, E.C.2.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd. (1,122C).—Capital, £1,250,000 in 750,000 ordinary, 250,000 preference, and 250,000 unissued shares of £1 each. Return dated December 10th, 1925. 750,000 ordinary and 250,000 preference shares taken up. £1,000,000 paid. Mortgages and charges, £400,000.

Electron Co., Ltd.—Particulars filed of £1,500 debentures authorised by resolutions of September 22nd, 1925, and February 2nd, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Simmonds & Stokes, Ltd.—Issue on February 23rd, 1926, of £1,000 debentures, part of a series already registered.

Cleveland and Durham Electric Power, Ltd.—Satisfaction to the extent of £12,100 on various dates between March 19th, 1925, and February 9th, 1926, of debentures secured by trust deed dated October 6th, 1913, and supplemental trust deed dated December 31st, 1918, securing £250,000.

Technical Instrument Case Manufacturing Co., Ltd.—W. B. Pearson, of 5, John Street, Bedford Row, W.C.1, ceased to act as receiver or manager on February 17th, 1926.

Robins Wholesale Electrical and Wireless Co., Ltd.—J. W. Williams, of 5, St. Andrew's Crescent, Cardiff, ceased to act as receiver or manager on February 23rd, 1926.

British Ebonite Co., Ltd.—Particulars filed on February 20th, 1926, of £10,000 debentures authorised April 27th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Attaix, Ltd.—Mortgage on the company's property, present and future, including uncalled capital, dated February 10th, 1926, to secure all moneys which the mortgagee (H. Benger, South-Western Hotel, Southampton) may be called upon to pay under a guarantee to bankers to secure an overdraft up to £500.

Davis Electrical Co., Ltd. (177,301).—Capital, £1,000 in £1 shares. Return dated December 31st, 1925. 677 shares taken up. £377 paid. £300 considered as paid. Mortgages and charges, nil.

Elba, Ltd.—J. Chapman, of 46, King's Road, Sloane Square, S.W.3, ceased to act as receiver and manager on June 16th, 1925. (Notice filed February 24th, 1926.)

Red Seal Products, Ltd.—E. A. Mallett, of 32-34, Theobald's Road, W.C.1, was appointed receiver on February 23rd, 1926, under powers contained in debenture dated February 3rd, 1926.

Llangollen and District Electric Light and Power Co., Ltd.—Satisfaction in full on February 5th, 1926, of debenture and mortgage dated December 14th, 1907, securing £400.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Charing Cross Electricity Supply Co., Ltd.

The accounts for the past year show that the gross earnings of the West End Undertakings were £325,985 (as compared with £304,013), and that the net earnings were £144,690, as against £113,621. A balance of £19,444 brought forward, and £55,667, interest, &c., are added, making £219,800. After providing for depreciation (£22,000), debenture interest, preference dividend and interim ordinary dividend (1s. 6d. per share) there remains £118,771. It was proposed to pay a final dividend at the same rate on the ordinary shares, to transfer £55,000 to general reserve (income) account, and to carry forward £20,571. The connections are stated to total 29,896 kW.

The gross earnings of the City Undertaking were £417,862 (against £423,811), and the net earnings £211,004 (£217,222). A balance of £20,500 brought forward is added, making £231,305, and after deducting debenture interest, &c., preference dividend, and an interim dividend at the rate of 2s. per share on the ordinary shares, there remains £105,217. From this, £85,000 is to be transferred to the general reserve (income) account, and the balance (£20,217) is carried forward. The connections now amount to 35,142 kW. The report refers to the reorganisation of London electricity supply, and states that the directors are engaged in taking the necessary steps to carry out the arrangements embodied in the Act. Referring to the capitalisation of the company's free reserves for distribution as bonus shares, the report says that the amount for the City is settled by the Act as £200,000, but the figure for the West End has not yet been ascertained as certain adjustments have to be made and approved by the authorities concerned. It is not proposed to make any distribution of bonus shares to the ordinary shareholders of the West End Undertakings until the whole amount available is known, when a further general meeting of the shareholders will be called. In the meantime the directors propose to bring the £200,000 through the Suppliers Construction Co. into the accounts of the West End Undertakings.

The annual meeting was held on March 4th. Mr. W. F. Fladgate (chairman), who presided, said that the directors had considered the amalgamation of the accounts of the City and West End Undertakings, but did not think that that was expedient. The progress of the undertaking as a whole had been extremely satisfactory. The energy sold had increased by over four million kWh, although 1½ million kWh of this was a temporary supply to the Metropolitan Electric Supply Co., Ltd. The gross revenue had increased by £12,000 while the expenses had been reduced by some £10,000, making a net increase of about £22,000. That was mainly due to the efficiency of their Bow station, aided to a small extent by cheaper coal. The accounts of the City Undertaking showed decreased receipts due to the reduction of charges to consumers. The expenses were, however, about the same in spite of the increased output. After dealing at some length with the changes in organisation, the chairman said that owing to the special terms of the City Provisional Order they had succeeded in getting a specific sum of £200,000 allowed to them without waiting for the result of the valuation. They had also succeeded in obtaining a provision that the rate of dividend, which in the case of all the other companies was to be reduced from 10 to 7 per cent. in 1931, was in respect of the City Undertaking to continue without reduction until 1936. Mr. Fladgate said that a gratifying response had been made to the recent issue of capital by the London Power Co., which showed that the investing public considered the scheme a sound one. He deprecated the attitude of hostility which had been adopted by the directors of some of the gas companies. He thought that there was ample room for both industries, and that their interests would be better served by friendly relationship.

The report and accounts were adopted, and subsequently a resolution was passed authorising the directors to create a further 150,000 City Undertaking ordinary shares of £1 each, ranking *pari passu* with the existing shares; and to capitalise a sum of £200,000 of the undivided profits of the company for distribution as ordinary shares to the present ordinary shareholders in the proportion of four new shares to each seven now held.

At the conclusion of the proceedings Mr. J. M. Gatti expressed appreciation of the chairman's services, and asked him to sit for a portrait to be hung in the board room. The chairman expressed his thanks and the meeting terminated.

Telegraph Construction and Maintenance Co., Ltd.

The annual meeting was held on March 4th, the Earl of Selborne, K.G., in the chair. In proposing the adoption of the report, the chairman, dealing first with the accounts, said there was an increase of £382,482 under the head "Debts owing by the Company," which was due to the receipt of instalments for cable not actually laid before the close of the year. That figure was reflected on the credit side by the greatly increased value of property, &c., which stood at £1,369,570, an increase of £960,794 over the figure for the previous year, which was due to the very large stocks of manufactured cable and of material purchased for cable to be made during the current year. The net profit amounted last year to £110,630, and adding £114,861 brought forward from the previous year they had a total of £225,492. Out of that amount the interim dividend, amounting to £22,410, had been deducted, leaving £203,082 for disposal. The directors proposed to distribute the same dividend as in the previous year (10 per cent.) and again add £30,000 to the reserve fund, which would leave £105,852 to be carried forward. On the occasion of the last general meeting, Mr. Colin Campbell, who presided in his absence, had referred to the fact that rather less profit than usual was shown, which, he had said, was due to an additional expenditure on buildings and machinery erected for carrying out a most important and interesting experiment for the Western Union Telegraph Company in connection with a submarine cable, having some special features, which they had manufactured and laid between New York and the Azores. The chief feature consisted in covering the copper conductor with a thin metal wrapping of special high permeability alloy before being insulated with the usual gutta-percha, and cables

this kind were now commonly known as "loaded." In ie particular cable to which he had referred, the alloy used as known as "permalloy," and was supplied for the purpose y the Western Electric Company of New York. The results otained in the working speed of this experimental cable had een such that the Western Union Telegraph Company deter- ined to take full advantage of its superiority over long sub- arine cables of the unloaded type, and had placed with em a further order for a loaded cable from New York to ay Roberts in Newfoundland, and for another from Bay oberts to Sennen Cove in Cornwall. Both of those cables ere in course of construction and were being loaded with ie Western Electric Company's alloy. They also possessed nportant and valuable patent rights relating to the loading cable conductors including a high permeability alloy known "Mumetal," and since those patents were likely to conflict ith those for a similar purpose possessed by the Western lectric Company of New York, it was thought advisable in ie interests of both companies to enter into an agreement hereby the patents should be pooled on terms of equality. hat agreement had now been signed, and he had no doubt at it would prove to the advantage of submarine tele- aphy. The first cable actually loaded with their own alloy d been manufactured for the Eastern Extension Company order to duplicate the cable between Perth and Cocos land, a distance of 1,624 nautical miles, and was now being id by their cable steamship *Colonia*. The Pacific Cable Board d resolved to duplicate its cable from Canada to Australia, d the company had secured the order for the section of ie cable to be laid between Vancouver and Fanning Island, d it was to be loaded with "Mumetal." That cable, which ould be the longest submarine span in the world, would e 3,625 nautical miles in length, and they hoped to have it mpleted in the autumn. The original cable that they had id more than 23 years ago had never needed repairing in l those years. Their new cable ship, the *Dominia*, was a vin-screw oil-fuel steamer with a gross displacement of 9,000 ns. She was 509 ft. in length, and was fitted with all the test machinery and appliances for laying cable. She was pable of carrying 9,000 tons of cable (approximately 3,700 iles). Loaded cable could be used for direct working at igh speed over much longer distances than cable of the rdinary or unloaded type, with the result that relay stations uld be dispensed with and increasingly longer spans would obably be required in the future. Referring to the retire- ent of Mr. Francis Lucas from the board and from the anagement, his Lordship remarked that Mr. Lucas joined e Telegraph Construction Company on its formation in 64, and went to sea in the *Great Eastern* in 1865-66. He as now the sole survivor of those who took part in the oyage when the first Atlantic cable was successfully laid. s long ago as in 1874 he was first sent away in charge of cable-laying expedition, and by the time he was appointed managing director 20 years ago, he had laid 75,000 miles f submarine cable. The report was adopted after a short iscussion.

St. James' and Mall Electric Light Co., Ltd.

Mr. Walter Leaf (chairman) presided at the annual meeting on March 2nd, and in moving the adoption of the report and accounts (Electrical Review, February 19th, p. 306), said that the past year had een one of supreme importance to the electrical industry wing to the passage of legislation for the entire reorganisa- on of the London electricity supply. This would form the asis of the company's operations for the next 45 years. e then outlined in some detail the general provisions of he scheme, and said that the present position was that ey had submitted their schedules to the Joint Electricity uthority and had handed to the London County Council eir computations of the standard price, and were awaiting communication from those bodies. When they had come terms a meeting would be called to reconstitute the capital f the company on a new basis. One of the changes involved the Bill was the transfer of the Central Electric Co.'s ower station at Grove Road to the London Power Co. By his the St. James' and Westminster companies would be elieved from their liability for considerable sums invested the Central Company. Turning to the company's accounts, e said that after transferring £25,000 to the contingency und they had £72,800 to deal with, as compared with £46,893 n 1924. That great increase was due to two causes—a fall n the cost of generation combined with a large increase in utput. Although they had supplied 2½ million kWh more, he cost of generation was actually less. This was partly ue to a fall in the price of coal and partly to increased fficiency. The total cost per kWh had fallen from 0.989d. o 0.905d. Large extensions consisting of a boiler house, urbine house and pump house, to accommodate two new 5,000-kW sets and six 75,000-lb. boilers, were completed y the company's own staff during the year. Some £30,000 ad been saved by this direct employment of labour. The argest of the two sets and two of the boilers were practically ompleted and were available for load. The third boiler was ell advanced, and three additional boilers would be com- leted during the current year. Additional cooling towers f 20,000-kW capacity would be ready for next winter. The 2,000-V feeders linking up with the Willesden station of he Metropolitan Co. were in regular operation, and similar nks with the Charing Cross and Kensington and Notting Hill companies would be completed this year. Their large ncrease in revenue had enabled them to consider the for- mation of a pension fund. Now that they had an extension of existence for 40 years from 1931, they regarded it as an obligation to establish such a fund on the usual lines. It was proposed to set £25,000 aside as a reserve for the pro- vision of that fund as a beginning. When the question of capitalisation of their "free reserves" came up, the share- holders would be asked to devote a part of them to making a very substantial addition to the fund. The further question of an immediate reduction in charges was complicated by the fact that the Electricity Commissioners had determined that the sliding scale of prices should be effective from January 1st, 1926, and they expected shortly to have their standard price per kWh agreed. In the meantime the Board had decided to make certain reductions which would take effect from January 1st last. Any further concession which the L.C.C. might enable them to make would form the subject of a separate announcement. The report and accounts were adopted, and at a subsequent extraordinary general meeting the proposal to establish a pension fund was approved.

Midland Counties Electric Supply Co., Ltd.

The annual meeting was held on March 1st, Mr. George Balfour, M.P. (chairman) presiding. In moving the adoption of the report and accounts (Electrical Review, February 26th, p. 346), the chairman re- ferred to the death of Lord Chilston. He then said that the conditions under which all public service undertakings oper- ated last year were, to say the least, difficult. Tramways, railways and power undertakings were all operating under artificial conditions, or conditions of uncertainty, due to pend- ing legislation. Tramway undertakings had suffered from excessive omnibus competition, and the traction properties owned and operated by the company had, for the first time, made no contribution to the revenue. He believed, however, that the present conditions were only a passing phase, and that eventually the problem would be solved. Referring to the Government's electricity proposals, he said that a great deal had been said about linking up stations, and standardising frequency as a means of providing a cheap and abundant supply of power. That sort of supply could only be forth- coming if the industry was left alone and legislation confined to the protection of the public interest. Because the com- pany had only started active development three or four years ago, and had during the last three years laid 207 miles of high-pressure lines, it might be imagined that the average price per kWh would be high. In Derbyshire and Notting- hamshire, however, it was only 0.885d., and over four counties, including Leicestershire and Warwickshire, the average price was about 1d. If companies were left to develop upon the lines laid down in their Acts, progress would be much quicker. If the company had followed the decision of the Commis- sioners and not proceeded with the erection of a new power station, it would have been supplying only about 1/10th of its present load. During the present session of Parlia- ment the Leicestershire and Warwickshire Electric Power Co. was promoting a Bill empowering it to increase its capital by £500,000, and to increase its borrowing powers to 50 per cent. of the capital issued. Other clauses in the Bill related to removing the veto against overhead lines, to supply- ing electricity for traction purposes, &c. During the past year three Special Orders had been obtained and supplies in the districts had commenced; a further order awaited confirmation. After considerable delay the Derbyshire and Nottinghamshire Electric Power Co. had secured an Order to supply electricity in the Shardlow Rural District. The energy sold during 1925 totalled about 60,410,000 kWh in- clusive of bulk supplies given by the power companies to the company's own undertakings for distribution. This repre- sented an increase of, roughly, 14½ per cent. The number of consumers now served by the various supply companies was 8,657, as against 6,814, and the load had grown from 46,800 to 54,240 kW. During the year the installation of a 12,000-kW turbo-alternator at the Spondon station was com- pleted; the station buildings were capable of accommodating an additional 50,000 kW. At the Avon station an additional 6,000-kW turbo-alternator and boiler plant were in course of erection, and there was sufficient room for another unit. An additional boiler plant had also been installed in the Hinckley station. During the year an issue of 250,000 ordi- nary shares and 250,000 preference shares was made, the capital of the company being increased to £3,000,000.

Electrical Distribution of Yorkshire, Ltd.

The annual meeting was held at Leeds on March 2nd, Mr. R. W. Wickham pre- siding. In presenting the report and ac- counts (Electrical Review, February 26th, p. 347), he said that the large and im- portant development which had taken place had required a capital expenditure of £245,107. The issue of 250,000 ordinary shares made last October to provide for this was very suc- cessful. That capital was, however, nearly exhausted, and another issue would be necessary before long. The chairman then reviewed the progress of the company during the 21 years of its existence. He said that the imminence of the Government proposals for reorganisation had led to the sus- pension of their applications for further Orders. These appli- cations concerned 31 districts in which the local authorities had already intimated their support of the company's pro- posals, and seven other districts in which negotiations with the local authorities were still proceeding. He said that he could not speak as to the need for new legislation in other

parts of the country, but he considered that in the company's own area there was no need whatever for an additional organisation. If it was intended to tax one citizen to supply another with electricity at a loss, that was a political view with which he disagreed as being contrary to sound business principles. To the classes of generating and distributing companies it was proposed to add a third authority—an electricity board—which would purchase electricity from the generating authority, which would have to purchase back the energy which it had produced at a cost increased by the separate organisation. If Parliament would free the industry there was no doubt that the use of electricity would extend much more rapidly. The industry was able to finance itself and only needed reasonable facilities to increase the production and sale of electricity. The progress which had been made in the past was made in face of legislative and other difficulties, and he hoped that Parliament would not impose further fettering restrictions on the legitimate development of private enterprise.

London and Suburban Traction Co., Ltd.

In moving the adoption of the report and accounts at the annual meeting held on March 3rd, Lord Ashfield (the chairman) said that the company was in the same unhappy financial position as it was in a year ago. The sum available was entirely insufficient for the payment of any dividend. During 1925 the London Traffic Act had been put into force. It was the intention of the Act to give protection to tramways, and the London Traffic Advisory Committee proposed to see that that was done. A scheme had been drawn up by the Committee with a view to restricting omnibus competition on tramway routes. During last year the three tramway companies in which the company was interested had lost 10 million passengers, or over 5 per cent. of their traffic. In the meantime the workmen passengers had increased by about two millions. That increase impaired the operating efficiency of the undertakings by exaggerating the peak load traffics and reducing the average fare per passenger. He was convinced that there was a place for the tramways in the scheme of London's transport, and that that place was not a small one. As regarded the future, he said that any forecast must depend entirely upon the steps which the Minister of Transport took under the London Traffic Act. What had been done recently had encouraged him to hope that the Minister proposed to tackle this vital question of London's transport earnestly and vigorously. If that was done they might hope for better results in the future.

Underground Electric Railways Co. of London, Ltd.

The report for the year ended December 31st last shows total receipts of £740,445, a decrease of £53,363, and an expenditure of £62,378, a decline of £27,537, leaving net receipts of £678,067, as compared with £703,893 in 1924. A sum of £126,685 brought forward is added, and after the payment of interest on the company's 4½ per cent. bonds, the 6 per cent. first cumulative income debenture stock, and the 6 per cent. income bonds, a balance of £145,959 is carried forward. The investments have been increased by the purchase of 110,000 ordinary shares of £1 each of the North Metropolitan Electric Power Supply Co. The report shows that the balance of the Common Fund divisible among the companies forming the "Underground" group was £844,519, as compared with £819,724 in 1924. The Associated Equipment Co., Ltd., made a profit of £68,123, which, together with a balance brought in of £53,097, has been carried forward. The report states that the traffic of the tramway companies has continued to decline owing to growing omnibus competition, and the London & Suburban Traction Co. is again unable to pay its preference dividend. The report also reviews the developments in hand by the operating companies, and the Parliamentary proposals, which were dealt with in our summaries of the companies' reports. The death of Sir William M. Acworth is mentioned. The meeting was to be held yesterday (Thursday).

Isle of Thanet Electric Supply Co., Ltd.

Mr. A. R. Monks (chairman) presided at the annual meeting on March 1st. In moving the adoption of the report, which was reviewed in our issue of February 26th (p. 347), the chairman said that of their total revenue (£137,990), the tramway and omnibuses contributed £78,304, lighting and power £59,235, and discounts and transfer fees £451. During the year the capital expenditure amounted to £64,709, mainly upon additional plant and transmission and distribution cables. A 3,000-kW set had been installed to meet the increasing load. As their capital expenditure during the next year or so would be heavy they proposed to increase the capital to £500,000. Applications for new connections continued to come in at a satisfactory rate, and a supply was now being given in Birchington and Westgate which should lead to increasing revenue. The report and accounts were approved, and at a subsequent extraordinary meeting a resolution was passed for the raising of the company's capital.

Durelco, Ltd.

The report for the year ended September 30th, 1925, shows that after writing £545 off debenture expenses there was a loss of £1,345. The company is a holding concern dependent for its income on its subsidiaries. The combined profit of the latter, before providing for debenture interest, &c., was £20,000. Cryselco, Ltd., is said to have earned enough to pay a 10 per cent. dividend on its capital. Duram, Ltd., experienced a record year. Debenture interest and sinking fund absorb nearly £8,500 a year, and this, together with the generally difficult trading conditions, make it incumbent upon the directors to conserve the cash position of the subsidiary companies, and no dividends have therefore been received from these. At the annual meeting on March 4th, the chairman (the Earl of Kintore) said that both Duram, Ltd., and Cryselco, Ltd., had done well during the year. The financial position was being strengthened year by year. Steps had been taken to reorganise the capital of Duram, Ltd., with a view to writing down certain items.

Oxford Electric Co., Ltd.

The balance to the credit of the revenue account for 1925 is £50,112 (including £2,302 brought forward), and after providing for interest, &c., there remains £44,825. It is proposed to place £33,000 to reserve and renewal of plant account, and to pay a dividend at the rate of 7 per cent. on the ordinary shares (2½ per cent. already paid), leaving £2,075 to be carried forward. The directors recommend the division of the £5 ordinary and preference shares into £1 shares, and also the increasing of the capital by the creation of 75,000 6 per cent. cumulative preference shares of £1 each. At the same time it is proposed to raise the present preference dividend from 5 to 6 per cent., and to offer the new shares and the existing 20,000 unissued preference shares to the ordinary shareholders, in the first place. The meeting was to be held yesterday (Thursday).

Smithfield Markets Electric Supply Co., Ltd.

The annual meeting was held on February 25th. Sir H. S. Leon, Bart., who presided, first referred to the death of Mr. Browne Martin, a director, and then, turning to the accounts, said that the profit showed an increase of about £870 and the amount carried forward was £300 higher. The cash reserves had been increased by £9,000, and the financial position was extremely satisfactory. The company was not affected by the recent legislation and, with reduced charges, it was hoped to at least maintain the present output and show good results. In reply to a shareholder, who thought that the dividend might have been higher, the chairman said that it was the board's policy to provide a reserve fund which would enable them to repay the share capital at par if the City Corporation decided to purchase the undertaking in 1932.

Kensington and Knightsbridge Electric Lighting Co., Ltd.

The report for 1925 records a net profit of £29,363, which together with £16,871 brought forward, gives an available balance of £46,234. Interim dividends absorbed £8,625, and it is proposed to deal with the balance (£37,609) as follows: To reserve for employés' superannuation, £10,000; preference dividends, £2,125; final dividend of 10s. per share on the ordinary shares (making 15 per cent. for the year), £10,500; leaving £14,984 to be carried forward. In common with the reports of other London companies, the report makes reference to the reorganisation schemes and states that the directors are taking steps to carry out the arrangements embodied in the London Electricity (No. 2) Act, 1925. The sum of £10,000 reserved for employés' superannuation is an initial sum. The meeting is to be held on March 18th.

German Companies.

The *Bavarian Telephone Works Co.*, of Munich, has carried forward the net profits of 6,300 marks earned in 1924-25.

The *Electric Supply Co., of Berlin*, reports that the net profits increased from 1,754,000 marks in 1924, to 2,078,000 marks last year, and the rate of dividend is advanced from 8 to 9 per cent.

The *Electric Light & Power Investments Co.*, of Berlin, which was unable to pay a dividend for 1924, proposes to distribute 8 per cent. for last year out of net profits amounting to 1,540,000 marks. The directors state that the associated manufacturing companies had a larger turnover, as compared with the preceding year and before the war, although the works were not producing at their full capacity, owing to the unfavourable general economic situation, as well as to taxes and social burdens.

French Companies.

The directors of the *Etablissements Electro-Industriels E. Rabet*, of Vessoul, report that the net profits for the six months ended with last December amount to 161,000 fr.

The *Compagnie Générale Parisienne de Tramways* reports net profits of 3,231,000 fr. for 1925, as compared with 3,091,000 fr. in the previous year. The priority shares are to receive a dividend at the rate of 16 fr. per share, the ordinary shares one of 13.50 fr., and the preference shares one of 3.50 fr. per share.

La Société de l'Energie Electrique du Nord de la France, of Paris, is increasing its capital from 70 to 100 million fr.

Spanish Companies.—The *Electra del Lima* concern, which belongs to a group of Spanish electrical companies, has issued over 16½ million pesetas in 6 per cent. bonds for the purpose of completing and extending its power and light works in Portugal, especially at Oporto.—*Reuter's Trade Service* (Madrid).

Cambridge Electric Supply Co., Ltd.—The report for the past year shows a total profit of £33,807. Out of this the directors have placed £15,000 to the depreciation fund and £10,000 to reserve, and recommend a dividend of 7 per cent. for the year, leaving a balance of £5,097 to be carried forward. To meet the demand the company has provided, and is providing, additional plant. It has been established that the Cambridge Corporation cannot acquire the company's works until 1935. The company successfully petitioned against the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Bill last session and secured a protecting clause. The report states that charges have not been reduced. The meeting is to be held on March 17th.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Ever-Ready Co. (Great Britain).—49,800 new ordinary shares of £1 each, fully paid, Nos. 449,001 to 498,800.

Isle of Thanet Electric Supply Co.—72,000 new six per cent. cumulative participating preference shares of £1 each, 10s. paid, Nos. 210,001 to 282,000.

Singapore Traction Co.—71,469 ordinary shares of £1 each, fully paid, Nos. 93,740 to 165,208; 47,110 seven per cent. cumulative preference shares of £1 each, fully paid, Nos. 152,891 to 200,000.

The undermentioned have been ordered to be officially quoted:—

Singapore Traction Co.—71,469 ordinary shares of £1 each fully paid, Nos. 93,740 to 165,208, and 47,110 7 per cent. cumulative preference shares of £1 each fully paid, Nos. 152,891 to 200,000.

Liverpool Overhead Railway Co.—The annual meeting was held on March 4th, Mr. T. D. Killey presiding. After the chairman had moved the adoption of the report shareholders criticised the board on account of its being again unable to pay an ordinary dividend. The chairman said that the success of the undertaking was dependent upon activity at the port, and prospects were much improved. A shareholder considered that the company would save considerable expense if a less frequent service was instituted. The board agreed to meet the shareholders in three months' time to discuss the position of the company, and a committee of three shareholders was appointed for that purpose.

London United Tramways, Ltd.—In the course of his speech at the annual meeting on March 3rd, the chairman (Mr. H. A. Vernet), referring to the deficiency of £29,149 incurred by the company, said that unless some measure of protection was afforded the company it could not continue to carry on. On the Uxbridge-Shepherd's Bush route omnibus competition had increased by no less than 550 per cent. since 1922. If they had to cease running what would be done for the 56,294,000 passengers who availed themselves of the company's services in the past year, 7½ millions of whom held workmen's tickets?

Commonwealth Edison Co.—The operating revenue for 1925 amounted to $58,691,583, and the net operating revenue to $22,429,174. After meeting various charges and adding other income of $937,239, there was a gross income of $15,867 905. The amount available for dividends was $10,766.786, and after paying these a balance of $3,563,844 was carried to surplus. The report states that the business expanded during the year. The amount of energy sold rose by about 11 per cent. to 3,091,424,000 kWh.

Ever-Ready Co. (Great Britain), Ltd.—At an extraordinary general meeting, held on March 1st, Mr. M. Goodchild presiding, a resolution was adopted authorising the capitalisation of £49,800 of the undivided profits of the company. The chairman said that there was an increasing demand for their batteries, and new avenues for further expansion were constantly being sought. The liquid resources of the company were very strong, and they proposed to issue the new capital in the form of £1 shares to the ordinary shareholders.

Mackay Companies.—The report for 1925 records an income from investments of $4,801,207. Regular quarterly dividends at the rate of 4 per cent. per annum on the preferred shares and 7 per cent. on the common shares have been paid. It is stated that the operating companies' business has continued to expand despite the competition of other methods of communication. The investments are valued at $94,294,549, against liabilities of $768 808. The issued capital is $91,380,400, giving a surplus of $2,145,341.

Shawinigan Water and Power Co.—The gross earnings during 1925 amounted to $6,702.034 and the net receipts to $2,366,338, as compared with $2 045,899 in 1924. After making the usual allocations and paying dividends at the rates of 7 per cent. for the first six months of the year and 8 per cent. for the latter half, a balance of $573.246 is carried forward. The working capital is shown at $3,398,083, as compared with $1,649,979 at the close of 1924.

Bell Telephone Co. of Canada.—The net operating revenues for 1925 amounted to $5,897,964, an increase of $361,150. In spite of this, however, the final result was a deficit of $8,712, as compared with a credit balance of $552,057 in the preceding year. The difference was due to a larger amount paid out in dividends.

Italian Company.—*La Società Italiana Metallurgica-Elettrotitica*, of Milan, is increasing its capital from 4,500,000 to 7,255,000 lire.

British Insulated Cables, Ltd.—A final dividend of 5 per cent. and a bonus of the same amount have been declared on the old ordinary shares, making 15 per cent. for the year. The new (bonus) ordinary shares are to receive a 5 per cent. dividend and a 5 per cent. bonus, making 10 per cent. £408,333 is transferred to reserve and depreciation, and £224,000 is carried forward.

W. Canning & Co., Ltd.—The report for the year ended December 31st last shows a profit of £43,297, to which is added £6,697 brought forward, making £49,994. It is proposed to pay a dividend of 10 per cent. and a bonus of 6d. per share upon the ordinary shares, to transfer £15,000 to reserve, to allocate £1,000 to the employés' benevolent trust fund, and to carry forward £4.228. The 1924 dividend was 10 per cent. Meeting: March 15th.

Davis & Timmins, Ltd.—The net profit for 1925 was £17,998, and to this is added £24,799 brought forward, making £42,796. A final dividend at the rate of 10 per cent., free of tax, is recommended on the ordinary shares (making 8 per cent., tax free, for the year), plus a bonus of 17 per cent., free of tax. A similar distribution was made in 1924. The carry-forward is £24,588.

India Rubber, Gutta Percha and Telegraph Works Co., Ltd.—The list for public applications for the issue of £400,000 five per cent. first mortgage debentures to bearer was closed at 11 o'clock on Saturday morning. Applications for renewals by existing debenture holders up to the amount of their present holdings must be received not later than March 15th.

Midland Electric Corporation for Power Distribution, Ltd.—A final dividend of 5 per cent., and a bonus of 5 per cent. are recommended on the ordinary shares, making a total distribution of 15 per cent. for the year, as in 1924. The directors propose to offer 70,000 new £1 ordinary shares to present shareholders at par.

Reduction of Capital.—Armorduct Cable Co., Ltd., and Reduced.—A petition for the confirmation of the reduction of capital of this company from £10,100 to £2,341 has been presented to the High Court, and will be heard in London on March 16th.

City of London Electric Lighting Co., Ltd.—The directors recommend the payment of final dividends on the 6 and 8 per cent. cumulative preference shares, and one of 2s. per share on the ordinary shares, making 15 per cent. for the year.

Vickers, Ltd.—The final dividends have been declared on the preferred stock and preference shares, but no dividend is to be paid on the ordinary shares which were recently reduced from £1 to 6s. 8d. each.

Clarke, Chapman & Co., Ltd.—A final dividend of 2½ per cent. has been declared on the ordinary shares, making 5 per cent. for the year. £6,259 is transferred to reserve and £2,192 carried forward.

Western Telegraph Co., Ltd.—The directors have declared the second quarterly interim dividend of 5s. per share, free of tax, for the year ending June 30th, 1926, being at the rate of 10 per cent. per annum.

Globe Telegraph and Trust Co., Ltd.—The usual quarterly dividend of 1½ per cent. has been declared on the ordinary shares.

Brazilian Traction, Light and Power Co., Ltd.—A quarterly dividend of 1½ per cent. has been declared on the preference shares.

Eastern Telegraph Co., Ltd.—Final dividend for the year ended December 31st, 1925, of 2½ per cent. free of tax, on the ordinary stock, making 10 per cent. free of tax.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—Final dividend for the year 1925 of 5s. per share, free of income tax.

Central Electric Supply Co.—The £800,000 5½ per cent. secured and guaranteed notes will be redeemed at par on April 1st.

British Columbia Electric Railway Co., Ltd.—The company is making an issue, for public subscription in Canada, of $1,500,000 six per cent. preferred stock.

Stocks and Shares.

Monday Evening.

New York has been passing through a financial panic and subsequent recovery, which have left their mark upon prices of various utility stocks and shares in companies that operate in Mexico, Canada and Brazil. So far as active interest amongst investors in this country went, Brazilian Tractions provided the most interesting storm centre. The price fell from 97 to 91, rallying sharply to 94. Points were sheared off the prices of Montreal Light, Heat & Power, Pennysylvania Water, Shawinigan, and others of this description. American Telephones gave way and there was a general offering amongst American industrials of all kinds, following the slump which

overtook the shares of the United States railroad companies. As soon as the force of the panic had blown itself out, reaction set in, and prices swung up again. The effect of this particular excitement on London might have been disastrous had there been any open account on this side in American shares, but, interest being so limited, the proceedings from Wall Street have been watched with an attention mainly academic.

The City of London Electric Lighting Co. has announced a final dividend of 2s., making 15 per cent. for the year, and this completes the tale of the dividend announcements by the London electricity supply companies. In every case the distribution is to be at the same rate as that for 1924. The directors evidently consider it judicious to fortify reserves, and to strengthen the financial position of the companies, rather than to distribute earnings upon the scale which they could have done had they chosen to have been less conservative. The prudent policy is likely to turn out the best for shareholders. Anticipation now looks forward to the time when the capitals shall be re-organised in accordance with the terms of the Bills passed by Parliament last year. London Power 5 per cent. debenture stock has risen to 7/16 premium, and is likely to go better when the stock is settled into permanent investment hands.

The India Rubber, Gutta Percha & Telegraph Works Co. has offered £400,000 5 per cent. first mortgage debentures to bearer at 93, redeemable 1936. This issue is made solely for the purpose of repaying an existing amount of similar extent. Holders of the expiring debentures receive preference in allotment and £7 difference between the redemption price of their existing stock and the issue price of the new. No underwriting was considered necessary, and this confidence became justified by prompt over-subscription of the stock.

Changes in the prices of electricity supply shares are almost negligible. The only alteration that is worth noting is a rise, in partial recovery of the dividend, in St. James' & Pall Mall shares to 15⅞. London Electric preference are a shade harder, and the ordinary shares at 32s. are also a little better, allowing for deduction of the dividends in both cases. Midland Counties ex dividend are 22s. 3d. The Midland Electric Corporation for Power Distribution is about to offer 70,000 new ordinary shares to its proprietors in the proportion of one new share for every four shares held. The existing price of the old shares is 53s., and the company's 7 per cent. preference stand at 25s. middle. Metropolitans remain at 39s. 6d., the dividend being at the rate of 16 per cent., to make 11 per cent. for the year, the same as that for 1924. The net receipts for the twelve months show an increase of £31,000.

Underground Railway stocks are steady, Metropolitans and Districts being quoted ex dividend last week. Taking these deductions into account, the prices are but little changed. The fear of an engineers' lock-out and a strike in certain other trades are deterrents against investment and speculation in Home Railway stocks. Underground Electric ordinary and "A" shares are both firmer. The company's report shows that net receipts for last year were £678,000 against £703,000 in the year before. Substantial economies were effected in expenditure, but the traffic showed a decline, not very surprising in view of the fact that the figures went against those of the first Exhibition year.

Cable stocks and shares are neglected, an eighth fall in Western Telegraphs being offset by a similar improvement in Eastern Extensions. It is worth noticing that the latter now stand 7s. 6d. higher than Westerns Both companies pay the same dividends, namely, 10 per cent. for the year, the Western having declared its usual quarterly distribution a few days ago. Eastern ordinary remains at 177½. Chili Telephones are 5/16 up at 6⅞, the rest of the telephone group holding its prices.

Wireless shares are dull, and, although Marconis are called nominally 23s. 9d., the market in them is heavy. Burndept preferred strengthened to 15s. 9d. Radio Corporation Common fell to 6½ on the slump in New York, but recovered part of the drop, being now quoted at 7½. The preferred are 9¼ xd. Telephonic communication having been established with New York, the Stock Exchange and Wall Street markets can exchange vocal greetings. Business between the two centres has yet to revive.

Amongst manufacturing shares, Edison-Swans gave way to 8s. 6d. Electric Constructions are lower at 32s. 6d., English Electrics weakened to 19s. 6d., Brush to 27s. General Electric ordinary and preference are both down. The disposition has been to let prices droop in the absence of fresh support from investment, and the apprehension of renewed strikes. British Insulated continue steady at 3, on the dividend and bonus, making 15 per cent., the same as last year, when, however, the capital was considerably less than it is to-day. It may be recalled that the British Insulated distributed a share bonus of 33⅓ per cent. some few months ago.

The engineering group is marking time, with Babcocks 53s. 9d. Rubber shares are in a state of suppressed excitement. The panic in America caused a drop in the price of the raw stuff, but, in spite of this, buyers of shares came forward on this side, and the market looks more cheerful than it has done for the last few weeks There is a noticeable demand for shares in the best class companies, and with rubber close to half-a-crown per lb., confidence is beginning to return.

The Ideal Home Exhibition.—II.

Electrical Features at Olympia.

In this issue we are able to reproduce some views of the Electric House " which has been arranged at Olympia by the ritish Electrical Development Association (*vide* our last issue, 403). These give a good impression of what an all-electric me should be, and contrasted with Mid-Victorian " horrible amples " (for which we have no space) the brightness and mosphere of well-being of the apartments are considerably hanced. The first view shows the exterior, which is attrac-ely decorated, with a specially dressed bay window, an elec-ical " address," and a small lawn with an electric mower. g. 2 depicts the laundry and is illustrative of the labour-sav-g attributes of electricity. Fig. 3 shows the bathroom and emplifies the convenience and cleanliness of electrical

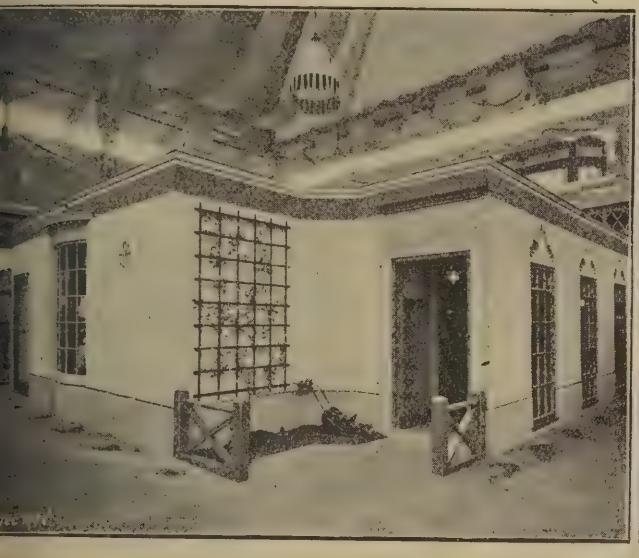

Fig. 1.—An Exterior View.

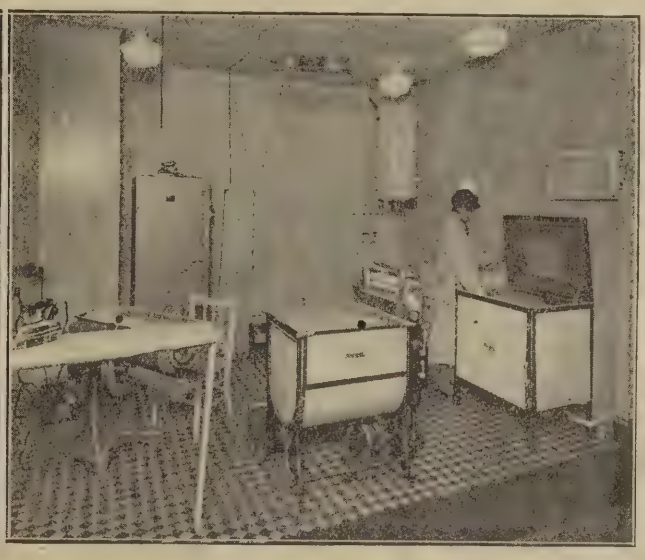

Fig. 2.—The Laundry.

Fig. 3.—The Bathroom.

Fig. 4.—The Sitting Room.

The Electric House at Olympia.

thods. The comfort of an electric home is impressed upon visitor by the sitting room, illustrated in fig. 4, with its itation coal fire, ample light where it is needed, a fan, and a endid radio set. One feature which will be noticed is the tch plug fitted beneath the table, which eliminates the ible lead from the lampholder which is usually required if le appliances are employed. The Electric House is of the main attractions of the Exhibition, and are bound to remark that it is the only electric house re. There are again a number of attractive model resi-ces open to the public, but, as usual, the only application electricity appears to be lighting. On the other hand, ong the " Kitchens of All Nations " which have been anged in the gallery there is an American type in which electric cooker has been installed. Generally speaking, part played by electrical firms in this year's exhibition is rger and more attractive one. The following notes indi-the principal electrical features which are to be seen :—

Hotpoint Electric Appliance Co., Ltd.

A wide variety of apparatus is displayed by this company. Among the appliances shown is the new " Falconette " cooker, which is very suitable for small dwellings. It has an oven measuring 9 in. by 10½ in. by 12 in., with a drop-down front. There is a bottom element and another one in the top which serves both for the oven and as a grill. The total loading is 3,000 W. A device which we think is new to this country is the " Toastmaster " (American) timed toasting appliance. Several designs are shown, but the main features are levers which lower the bread into the body of the appliance, and at the same time switch on. There is a timing device graduated in seconds, and until this is set the levers will not remain down. When the toasting time has elapsed the levers are released and bring the bread out. Another type of cooker shown is fitted with the new " quick-service " boiling rings which can be substituted for the older patterns. An " Aerobell " washer, " Premier-Duplex " vacuum cleaners, toasters, kettles, irons, fires, &c., are also on view.

L. G. Hawkins & Co., Ltd.

This company again has a very comprehensive display of electric lighting, heating, cooking and labour-saving appliances. The lighting fittings, especially, are of a very high order, and comprise electroliers, standards, bowls, &c., of excellent glass and metal work. The appliances are too numerous to mention separately; it will suffice to say that there are few of the familiar devices absent. A part of the stand has been made into a small demonstrating theatre. There is seating accommodation, and upon a dais is mounted

a model electric kitchen in which Ald. Mrs. Hammer and Mrs. Pearmain, of Hackney, show and explain the use of the "Universal" cooker.

Belling & Co.

Electric fires form the main part of this exhibit. Several examples of "period" styles, including "Jacobean" and "Adam" patterns, are shown, and they are all of handsome appearance. A lighter reflector type appears, consisting of a sheet metal body with a coppered reflector, below which the elements are mounted horizontally. An effective contrast has been arranged between an electric fireplace and one of the ordinary coal variety with its concomitants of dust and trouble. Examples of double fires in art metal are also exhibited. The cooking exhibit includes a standard range with plug-in elements and a separate grilling and boiling table. Each element is controlled by a three-heat switch mounted on a separate board. Water-heating apparatus, kettles, irons, hotplates, and other appliances complete the exhibit.

Dowsing Radiant Heat Co., Ltd.

This company's show is also a widely-varied one ranging from an electric cooker to a cigarette lighter. The cooker is a Canadian design (McClary's), and its principal advantage is the way in which the elements are clipped into position. Apart from this the appliance is of very handsome appearance, and is mounted on legs of convenient height. The oven has a drop-down front, in which a dial thermometer is fitted. The "Sunrae" carbon arc lamp giving ultra-violet radiation and an artificial sunlight projector are other exhibits. In addition there are radiant heaters ("sausage" type), kettles, irons, branding irons, violet-ray apparatus, sealing wax heaters, glue pots, and many other appliances.

Standard Telephones and Cables, Ltd.

This stand is divided into two main sections. The first contains two sideboards upon which are arranged a number of electric table appliances—urns, percolators, toasters, &c., while upon the carpet with which the floor is covered the "Standard" vacuum cleaner is demonstrated. The other half is arranged as a model laundry in which are two "Western Electric" washing machines, an ironer and irons; these are continuously demonstrated.

International Electric Co., Ltd.

Intercommunication and other telephone equipment is shown by the company, including mining and G.P.O. automatic telephones. A radio receiving set and a new type of loud speaker are other exhibits.

Francis Polden & Co., Ltd.

A selection of Best & Lloyd lighting fittings is one of the notable features of this stand. In addition, the company shows examples of the "Frigidaire" refrigerator and the compact "Delco-Light" small generating set. Other exhibits are "Hoover" vacuum cleaners, electric fires of many patterns, portable radio sets, irons, kettles, and other domestic appliances.

Read & Morris, Ltd.

The speciality of this company is a radio receiver which works from d.c. mains and thus dispenses with batteries. A typical example shown is a 3-valve hospital receiver which is being supplied to the Millbank (military) Hospital under the *Daily News* scheme. The installation is capable of working 350 pairs of 'phones and seven loud speakers. Other sets on view are a 5-valve set with a loud-speaker range of 2,000 miles and a domestic set for use on d.c. mains.

Thorn & Hoddle, Ltd.

A part of this stand is arranged as a country residence power house. In it are a small "Pelapone" lighting set, together with an appropriate battery and switchboard. Another notable exhibit is a larger "Pelapone" set giving from 100 to 140 A at 80 V. Lighting fittings are also shown.

S. G. Brown, Ltd.

A fine collection of loud speakers appears on this stand. Among them are examples of instruments with beautifully-produced mahogany trumpets, cabinet patterns, "Crystavox" speakers for use with crystal sets, &c. An outstanding exhibit is the "P.Q." loud speaker with a long straight horn, designed for demonstration and outdoor purposes.

Electrolux, Ltd.

This company shows for the first time at an exhibition the ingenious refrigerating apparatus described in our issue of February 26th (p. 327), as well as the more familiar "Electrolux" vacuum cleaner.

Reliance Telephone Co., Ltd.

Two patterns of automatic telephone exchanges are to be seen on this stand, as well as many examples of intercommunication telephones of wall and desk patterns and different designs, and the "Cannon" burglar alarm, an electrical relay system.

Hammond Bros. & Champness, Ltd.

Among a display of lift equipment this company shows a working service lift fitted with push-button control.

Delco Light Co.

A number of examples of "Frigidaire" units and refrigerating cabinets are shown by this firm, in addition to its well-known "Delco-Light" small generating set.

Hurley Machine Co.

This firm shows the popular "Thor" washers in operation, both the revolving-cylinder and vacuum cup types, in addition to ironers and vacuum cleaners.

Beatty Bros., Ltd.

This company also has an electric washing display employing "White Cap" and "Red Star" washing machines and an ironer.

Other Exhibitors.

The following concerns also have stands at the Exhibition:—Electric Appliances Co., Ltd. ("Eureka" vacuum cleaners); Venetian Glass Galleries and A. Martelli (artistic lighting bowls); B.I. Syndicate, Ltd. ("Astro" reflectors); Mechanical Refrigerator Co., Ltd. (electrically-driven refrigerators); I. Calvete, Ltd. (electro-medical apparatus); British Vacuum Cleaner Co., Ltd. (the "Turbinet" electric vacuum cleaner); Hoover, Ltd. (vacuum cleaners); Betax Mfg. Co., Ltd. (fans, vibrators, bowl fires, &c.); A. W. Gamage, Ltd. (washing machines and vacuum cleaners); and Singer Sewing Machine Co., Ltd. (electrically-driven machines).

The Exhibition remains open until March 27th.

Electrical Power Engineers' Association.

N.W. Midlands Section: Annual Dinner.

The North-West Midlands Section of the Electrical Power Engineers' Association held its annual dinner at the Star and Garter Hotel, Wolverhampton, on March 3rd, when nearly one hundred members and friends were present, and Mr. D. J. Duffy, chairman of the Section, presided.

Mr. F. Forrest in proposing "The Association" conveyed a message of greeting from the president of the Institution of Electrical Engineers, who was unable to be present. In referring to the proposed national electricity scheme, he suggested that the Association would have to watch the Bill and see that the interests of its members were safeguarded. Mr. A. J. Ostler, past-president of the Association, in reply, said the progress of the Association had been due to the amicable working of the Joint Boards, the very pleasant atmosphere of which made good work possible.

Mr. S. T. Allen, chief engineer, Wolverhampton, proposed "The Joint Boards." He drew attention to the great debt which the industries of this country, and the electrical industry in particular, owed to Mr. Whitley for his scheme, out of which arose the joint boards and joint industrial councils which had preserved in the electrical industry comparative peace since their inception.

Mr. J. H. Legge replied for the employers' side of the joint boards, and said that, to his mind, it was quite wrong for the Government to have anything to do with an industry so young. The Government in its proposals appeared to be concentrating on generation alone, but much of the work to be done in this country was to develop the industry. In generation there was no country that could beat us on the figures we obtained, but we were too far behind in selling; more attention should be paid to that side. One difficulty he had in his undertaking was to obtain men with both commercial "kick" and sound engineering ability.

Mr. W. Arthur Jones, general secretary of the Association, replied for the employés' side of the joint boards, and referred to the very valuable work accomplished by the No. 5 District Joint Board, in particular with regard to the training-of-engineers scheme. He said the Association had not had a national dispute since the inception of the Whitley Council, and if that lesson was taken to heart it would be much better for industry generally.

Mr. F. J. Baldwin proposed "The Visitors," to which Mr. A. Whitehouse, J.P., responded, making special reference to the amicable relations between himself and the chief engineers with whom he had come in contact during the formation of the Joint Electricity Authority for the West Midlands area.

Mr. T. A. G. Margary referred to the valuable work of the entertainments committee, and specially mentioned Mr. P. M. Pinder, who in reply thanked all members for their co-operation.

An excellent and varied programme of entertainment was interspersed between the different speeches during the evening, the artistes being: Mrs. Thomson, Mrs. Whale, Mr. Brewer and Partner, and Messrs. Friend and E. J. Smith, to whom a vote of thanks was very heartily given.

The British Industries Fair.—V.

A Review of Electrical Exhibits.

Holden & Hunt.

A number of resistance welding machines were shown by this company. The principal one was a spot welder capable of dealing with iron and mild steel up to ¼ in. thickness with one setting and up to 5/16 in. thickness for occasional work. The rating is 12 kW and an automatic trip switch is fitted to guard against excessive loads. Operation, by a foot pedal, is effortless and within the capability of unskilled boys or girls. A hand-operated, 30-kW butt-welding machine was another exhibit. This appliance is water-cooled throughout and has an efficient heat-regulating arrangement. A chain-welding machine (5 kW) capable of dealing with from 10 to 20 links per minute, according to size, was also shown.

Jackson Electric Stove Co., Ltd.

This company, whose stand was prominent in the view of a part of the electrical display which was reproduced in our issue of February 26th, had a representative exhibit of its cooking and heating appliances. Fires of many designs were on view, including a number of elaborate "period" models and the "No. 589" general utility fire—a plain design with a cheerful appearance. The domestic side of electric cooking was represented by ten cookers to cater for families ranging in number from 2-3 to 10-14 persons. These were all fitted with the special elements which distinguish "Jackson" cookers. Commercial cooking apparatus was also given prominence. One of the appliances in this section was a large fish fryer with a pan measuring 18 in. by 14 in., designed to protect the elements from drippings. The total loading of this appliance is 4,900 W and it has hot-cupboards for storage purposes with a 350-W element. A large roasting oven was shown. This, with a loading of 10 kW, is capable of cooking from 150 to 200 lb. of meat at a time. The oven has a central lagged shelf dividing it into two parts. A collection of hot-plates and hot-cupboards (one of the latter being able to deal with 600 plates) formed a part of the exhibit. There were also a number of wash boilers in various finishes as well as water boilers, irons, kettles, toasters, and other appliances.

Electric Heating & Hardware, Ltd.

"Glowincoal" fires were the principal feature of this stand. This type of fire has a realistic imitation of glowing coals placed below a curved reflector. The elements are mounted horizontally at the foot of the reflector behind the "coal." A number of designs were shown, all of them of very attractive finish. In addition the company exhibited its "Komet" irons some of which were fitted with an automatically-released switch in the handles, while others had separate earthing terminals with a corresponding plug in the connectors.

Bastian Meter Co., Ltd.

The well-known "Quartzalite" element was in evidence here. Fires employing this tube of "solid" red heat were shown in various designs. "Bastian" storage geysers were another important exhibit. This appliance has been conceded special rates by a number of electricity supply authorities, several of which have adopted the geyser for their hiring schemes. An electrically-heated towel rail with the low loading of 660 W was another appliance shown, and the company also displayed small heaters, a small steel hardening furnace, an ozone generating machine, the "Pigmy" heater, small grills, and d.c. meters.

British Electric Transformer Co., Ltd.

This company's stand was one of the largest in the section; it had a frontage of about 70 ft. and was designed to show the firm's ability to supply large quantities of electrical appliances. To this end the back of the stand was almost entirely covered with an orderly array of fires, kettles, irons, toasters, &c. At each end of the stand small rooms were arranged to represent a sitting room, study, &c., and equipped with the company's "Sun Ray" radiators in various forms. These radiators, which have lamps as heating elements, diffuse a soft warm light and impart an air of cheerfulness to a room. Four types of "Tricity" cookers were shown, and the company's transformer business was represented by a number of photographs.

May & Padmore, Ltd.

This company also showed electric fires of various designs, many of them possessing a highly-artistic appearance. In addition to these, soldering irons, kettles and other devices were exhibited.

Veritys, Ltd.

Squirrel-cage and slip-ring motors formed the major part of this company's display, together with spare rotors and examples of windings. Rotor and stator starters, totally enclosed and ironclad with automatic features, and drum-type star-delta starters, were also shown. The "Orbit" fan, which has a wavelike reciprocating movement, was another exhibit, and upon this stand and that of the Birmingham Electric Supply Department, were a number of examples of "Maxlume" industrial lighting fittings.

Belling & Co.

A number of imitation coal fires with reflector backs, &c., were exhibited by this firm, including one model fitted into a standard grate. "Belling" cookers were shown in operation, and there were numerous examples of other domestic electrical appliances. One of the latter was a 400-W towel rail, the elements of which were contained in a removable cage.

Mouldensite, Ltd.

This company's exhibit included many samples of its phenolic condensation products, together with raw materials used in the process of manufacture. The samples included synthetic resins, moulding powders and impregnating varnishes, as well as numerous mouldings produced from "Mouldensite" powders, these being particularly suitable for electrical and radio apparatus. The mouldings possess a very high finish, which is maintained under practically all working conditions. The material is not affected by heat, moisture, water, oils, acids or petrol. In its finished form "Mouldensite" is claimed to possess very satisfactory dielectric and mechanical strength.

Hart Accumulator Co., Ltd.

This exhibit was devoted almost entirely to batteries for radio work. A feature of the l.p. patterns is the fact that they are assembled in pressed glass containers. Upon the insides of these are moulded ribs or grooves between which the plates rest, obviating the need for bottom blocks which tend to collect active material expelled from the plates, sometimes bridging the latter. The separators are of corrugated sheet ebonite. Celluloid-cased accumulators were also shown, as there is a large demand for these. In the "PLRG" h.p. battery, which was shown, the plates are contained in a moulded box provided with internal ribs arranged in such a manner that when a number of the cells are assembled together to form a battery the points of contact are reduced to a minimum, giving perfect insulation. The boxes are made of either ebonite or glass, and they are put up in teak crates. Another h.p. battery shown consists of circular glass boxes, each with a projecting rib which holds it in position on a perforated tray. There were also examples of house-lighting, vehicle, automobile, and central station batteries.

Henry Watson & Sons, Ltd.

A novel electric lawn mower appeared on this stand. The design of the machine is claimed to be unique inasmuch as the motor is effectively protected by being housed inside the main roller. The cutting cylinder is mounted on ball bearings and is driven by a train of helical gears running in an oil bath. The machine weighs less than 1 cwt. and is very compact. It will be understood that it is not *propelled* electrically but the electrical cutting gear facilitates movement.

G. Turnock.

This Birmingham firm showed, *inter alia*, an improved cable connector for jointing cables without solder, and also a device for taking a service wire off a main. Another exhibit was a novel method of winding heating coils, making it possible to confine 200 W in a tube 5 in. long by ⅛ in. in diameter. This is used for insertion purposes in the textile trades. A charging board for d.c. was shown. This had five circuits, the first of which was in series with the other four which were in parallel, to give various charging currents. Each circuit was provided with a separate 6-in. ammeter.

S. J. Daulby.

Upon this stand were exhibited a collection of d.c. motors and dynamos. These machines incorporate the Morgan patent, which consists principally of special ventilated pole pieces in conjunction with a fan, which creates an air swirl round the windings and through the pole pieces, keeping the temperature rise very low. The display included some small polishing motors ranging from 0.25 to 2 h.p.

E. H. Millington & Co., Ltd.

This company showed a wide range of shade and bowl fittings, plain and decorative, wall brackets, globe holders, ceiling roses, &c. A section was devoted to radio apparatus, and in this were "Lintaphone" crystal sets, two-valve sets, and a collection of components.

Rapid Magnetting Machine Co., Ltd.

This company exhibited examples of its electro-magnetic separators, some of which were of the rotary pattern with a revolving brass drum in which electro magnets are fixed, and over which the material to be treated is passed. Another pattern shown was of the shoot type, consisting primarily of an inclined plane having a series of powerful electro-magnetic bars of alternate polarity extending the width of the shoot, and magnetised throughout their length. This is particularly suited for the treatment of grain, as was demonstrated on the stand.

Wm. McGeoch & Co., Ltd.

Marine electrical fittings formed the bulk of this display. These included navigation lamps, switchgear, a special battery switchboard, lighting fittings for ships' use, navigation light indicators, and numerous accessories.

C. H. Parsons, Ltd.

In addition to their usual display of lampholders, tumbler switches, &c., Messrs. Parsons this year showed the "Ripplephone" headphones, for which they hold the sole manufacturing and selling rights. The switches shown included a number of shock-proof patterns with unbreakable composition covers. The tumbler switches exhibited were of a wide variety of finishes.

B.S.A. Radio, Ltd.

This new concern had a section of the stand of the Birmingham Small Arms Co., Ltd., and exhibited several examples of its radio sets, all of which were of very ornate design.

W. E. Burnand & Co.

One section of this exhibit comprised a.c. motors, including one for heavy work, having an extra large shaft, on which, for instance, a heavy band saw pulley could be mounted, and cast steel end frames. Examples of buffing and grinding motors were also shown. Another exhibit was an electric rivet heater capable of dealing with three $\frac{5}{8}$-in. diameter rivets up to $3\frac{1}{2}$ in. in length. An electric furnace was also shown.

Tok Switches, Ltd.

This was a very comprehensive exhibit of the firm's British-made rotary snap switches; numerous designs were shown, and one application which has met with the approval of engineers of supply companies was the "Aristocrat" interlocking switch plug for surface mounting, consisting of a double pole rotary switch with an external indicator, and a plug of the B.E.S.A. end-shield pattern fitted with an earthing terminal, capable of taking a wide range of cables.

London Electric Wire Co. & Smiths, Ltd.

A very comprehensive display of its wires and cables was made by this concern. Special prominence was given to "Glazite," the wire covered with many colours, for use in radio sets. Another radio product shown was the "Lewcos" inductance coil which is claimed to have a low h.f. resistance.

B.K.B. Electric Motors, Ltd.

A number of strongly-constructed fractional h.p. motors were shown by this firm, including an induction motor with a centrifugal switch device. An application of these motors in the form of the "Giljay" d.c. battery charger, the machine being fitted with a double-wound laminated armature and two commutators. A small switchboard with an ammeter is mounted on the frame of the machine and the whole forms a very compact and easily-operated equipment.

Magnetic Separators, Ltd.

This company's principal exhibit was a "Cascader" separator for extracting iron from granular or powdered materials and liquids. The machine is constructed in a series of steps, each step being undercut and having beneath it a magnetic field. As a result the lines of force from the pole shoes pass from a higher to a lower level across the undercut edge, developing a very strong magnetic field throughout the entire width of the magnet. Consequently as the flowing material falls over the pole shoes from a higher to a lower level any particles of iron, which would otherwise be carried along, are drawn into the angular spaces out of the path of the flow and retained there. Magnetic pulleys were another exhibit of the company.

Bulpitt & Sons, Ltd.

Among a collection of aluminium ware, this company showed a range of electric kettles, fitted with a loop-type immersion element and a patent safety device. The latter consists of a spring compressed into a small copper tube and retained in position by a plunger soldered with a special alloy into the open end. When the kettle is overheated the alloy melts and releases the spring, throwing off the connector.

Arora Co.

Several examples of its electric fires were shown by this firm. These were fitted with the firm's standard firebars which employ extra heavy tape-section strip for the coils, giving radiant heat at low current density. Cast-iron and sheet-metal frames were exhibited, and the types included the standard upright, bowl, reflector and other patterns.

Imperial Engineering Co.

This firm's exhibit was composed of a number of domestic appliances, including fires, irons, toasters, kettles, boiling rings, water heaters, &c. The "Imperial" iron, which was shown, has a number of special features. The fires included a number of sheet-metal and cast-iron patterns, some of which took the form of reflecting bowls mounted in ornamental frames. Several reflector types, as well as standard upright patterns, were also shown. A wash boiler with a loading of 3 kW and a capacity of $2\frac{1}{2}$ gallons, was exhibited, and another useful appliance shown was an electric bath water heater with a continuous loading of 200 W and a booster loading of $3\frac{1}{4}$ kW. The tank has a capacity of 10 gallons.

Bowen Instrument Co.

This company's principal exhibit was a number of electrical resistance pyrometers for measuring temperatures at a distance, together with accessories for these. The firm's "Polymeter" combines the indicator, multiple switch, and front cable terminals in one complete unit.

Tangyes, Ltd.

Engines and pumps constituted this company's exhibit. The former included a 47-b.h.p. cold-starting horizontal, heavy-oil engine, which is claimed to be very suitable for the driving of an electrical generator. There was also an 18-b.h.p. heavy-oil engine of the lamp-starting type. The pumps included a six-stage turbine pump, a 4-in. "A" type "Tangyro" centrifugal pump, and vertical single-ram patterns.

Steam Fittings Co., Ltd.

The scope of this company's exhibit is indicated by its title. A notable feature of the display was a range of automatic regulators, including all-metal relay thermostats suitable for controlling steam valves and maintaining temperatures up to 1,000 deg. F. This type is said to be so sensitive that when adjusted for room temperature it will operate a main steam valve when merely warmed by the hand for a few seconds. Boiler feed regulators, dial-indicating draught gauges, and dial thermometers fitted with contacts for operating electrical relays, were also included.

Reeves & Co.

This stand bore a large display of electrical accessories, including lamp-holders, tumbler switches, switch plates, galleries, &c.

Higgs Motors.

This display comprised component parts of a.c. and d.c. motors, assemblies of component parts, motor-generator sets, complete d.c. dynamos and motors, and one-, two-, and three-phase squirrel-cage and slip-ring induction motors. A notable exhibit was one of the firm's motors running under water.

Birkbys.

Upon this firm's stand were displayed numerous samples of "Elo" synthetic resin products. A particular feature was made of mouldings for radio and electrical work. Other compositions shown were insulating varnishes, synthetic resin in "lump" form, and moulding powders.

The London Fair.

Cousins & Co.

On this stand was shown the "Cousins' Perfect Electrical Waver" for Marcel-waving at home. This is an ingenious and convenient appliance, which is heated by electricity from the mains, but is disconnected before application to the hair. It was demonstrated in use.

The McClary Manufacturing Co.

This Canadian company showed electric cookers of several patterns, including the convenient bench type. An important change has recently been made by the adoption of a closed boiling plate, called the "Speediron," which is immune from injury by spilt fluids, &c. The plate is provided with prong terminals which fit into protected contacts underneath, so that, if necessary, it can be pulled out in a moment, without leaving any live metal exposed. Similarly the oven and grill elements are self-connecting. We understand that the "Speediron" is being fitted to all the McClary electric ranges. Other notable features were the use of a simple thermometer on the oven, showing four grades of temperature in bold figures, and an enamelled hob which cannot rust or peel.

Needham Bros.

The well-known portable electric fountain patented by this firm was shown in operation.

British Thomson-Houston Co., Ltd.

This double stand was furnished with the standard crystal and valve receivers, amplifiers, loud speakers, headphones, and valves with which the wireless world is familiar.

Clackson, Ltd.

Several new items appeared on this stand, such as the "Lowforma" coils and "Lowforma" crystal set; the latter was a very neat and compact arrangement, with provision for receiving Daventry, as well as the other stations. Other features were the "Triumph" two-coil holder, and the 5-in-1 coil mount, with which a variety of purposes can be met. Ebonite components are amongst the company's products.

Burndept Wireless, Ltd.

The leading feature of this exhibit was a seven-valve super-heterodyne set, with frame aerial. The company has entered the valve-manufacturing business, and showed a complete range of valves—one bright, and eight dull-emitters—of its own make. "Ethophone" specialities, the "Peter Pan" loud speaker, and everything required by the wireless experimenter, were shown.

Telegraph Condenser Co., Ltd.

This exhibit included condensers not only for radio work t also for power factor correction, the latter being manu-ctured on the large scale for voltages up to 6,000 V, in the rm of one-microfarad units which are built up in frames, and mersed in oil-filled steel tanks. Box-type condensers for dividual motors, suitable for any voltage between 200 and 0 V, are made. The range of Mansbridge-type condensers s been extended to 10 mF. For radio, both the Mansbridge ndard condensers and mica moulded condensers were shown, th having duplex terminals, which provide facilities for ewed or soldered connection at will; the former are made th a solid metal top. The series-parallel mica condenser s a new feature, made in sizes from 0.0001 to 0.0009 mF.; it ables the grid leak to be put in series or parallel with the ndenser without changing the wiring of a circuit. Another eresting item was the "silent salesman"—a cabinet made to resemble a T.C.C. Mansbridge condenser, and holding supply of 50 assorted sizes.

Receiving Sets.

Messrs. Wates Bros., Ltd., showed receiving sets, batteries, d loud speakers; British Radio Corporation, Ltd., cabinet eiving sets and components; Elven Mains Receiver Co., s operated from the mains, a.c. or d.c., without batteries; lcyon Wireless Supply Co., Ltd., portable sets without ials or earth connections; Read & Morris, Ltd., receivers rked from a.c. or d.c. mains, and other types; Ashley Wire-s Telephone Co. (1925), Ltd., "Claritone" loud speakers d headphones.

Permec, Ltd.

An ingenious micrometric crystal detector—the 1926 Permec type—was shown here, which enabled 200 different spots on a crystal to be touched by the cat's whisker, safeguarded the parts from frictional or other damage, and enabled any particular adjustment to be returned to with precision. Complete crystal sets were also shown.

The Formo Company.

Amongst the exhibits at this stand, items of special interest were a condenser described as the "straight-line frequency ultra low-loss" type, with special patented features, including a "micro-vernier" 200-to-1 dial, and a series of high-efficiency coils for tuning and coupling systems, with bank-wound turns on skeleton formers, of very ingenious design. Shrouded transformers and choke capacity couplers, plugs and jacks, &c., were also shown.

Radio Accessories, Components, &c.

A number of stands were devoted mainly to displays of wireless components and accessories; amongst these were the following firms:—Western Laboratories, Ltd., coil-holders, condensers, and crystal sets; Watmel Wireless Co., Ltd., grid-leaks, condensers, chokes; J. J. Eastick & Sons, collapsible frame aerials, coil mounts, variometers; Beard & Fitch, Ltd., gear wheels, "Success" transformers, and other accessories; Finston Manufacturing Co., Ltd., coils, condensers, mouldings; Lisenin Wireless Company, plugs and sockets, terminals and other components; North London Valve Co., Ltd., valves, X-ray tubes, and experimental apparatus.

Electro-Farming.

The Applications of Electricity to Agriculture.

By R. BORLASE MATTHEWS, M.I.E.E.

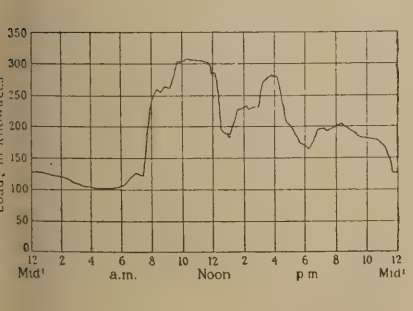
(*Abstract of Paper read before the* Institution of Electrical Engineers.)

e paper deals with the progress that has been made since e author's previous one on the same subject,* being also a uel to the report of the I.E.E. Committee on Electricity Agriculture.†

t is strange that one of the most backward countries in s development is the United States of America. Out of 788 million h.p.-hours per annum used on American farms, y 850 millions are supplied electrically. However, the matter eing taken up most energetically, and large sums of money being expended upon full-scale experimental work.

The Rural Distribution System.—Attention is drawn to the portance of dealing with satistics on the basis of route les, and not the area supplied. It is claimed that where quarter of the area is arable land, the supply will be fitable. Even in the towns the facts are much better repre-

Pracstical experience indicates, at the present stage, that in order to provide a remunerative electricity supply, from a quarter to a third of the area must be arable or rich dairy land. The point is not so much whether electric ploughing is to be employed or not—it will probably not be used in many districts for a few years—as the fact that a farmer with a good proportion of arable land needs to treat, in some way, the crops which he produces, or else he has to prepare food for stock. The amount of power necessary for these purposes has a direct relation to the area of land under the plough, and also to the fertility of the soil. In some of the more fertile parts of Europe the consumption of electricity is already 100 units per acre, without taking into account any current actually employed on the land for ploughing or other purposes. Ploughing and cultivation would have consumed an additional 60



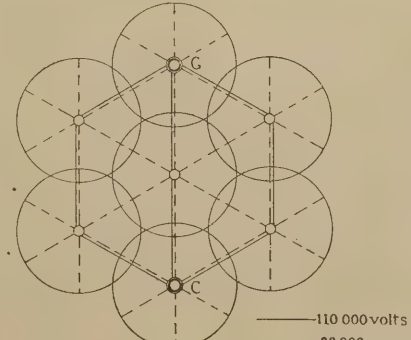


Fig. 1.—Load Curve of English Rural Distribution Line.

G C = generating stations 50 miles apart.
Sides of triangles represent distances of 25 miles.

Fig. 2.—Example of E.H.P. Rural Distribution.

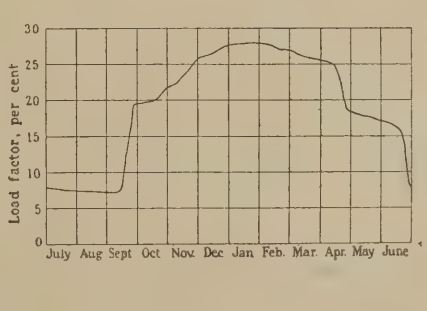

Fig. 3.—Load Factor of Mixed Dairy Farm.

ted by considering cable route-miles instead of square miles supply area; in the country there are already routes whereon consumption per mile of 10,000-volt distributor without ughing is equal, or more than equal, to the urban figure, the possible revenue per route mile of rural line is, at t, as large as that from the usual town load known to be fitably supplied. It must be remembered that villages and al industries will take a considerable supply in addition that consumed by the farms. Anything over 5,000 units annum per mile is profitable; the important matter is to rcise economy in construction work.

units per acre, while treatment and the handling of crops would absorb up to 40 units per acre. Over and above all this, there is a very important load that has not yet been touched, *viz.*, that of haulage, estimated at about 75 units per acre. Thus, under ideal conditions, it is possible to conceive a consumption of 275 units per acre, based upon present practice. In this country alone, assuming that its 57 million acres of land were all suitable for agriculture, on the above basis of consumption the requirements would be about 16,000 million units per annum, whereas the present output of all the generating stations in the country, including the output for railway work, is only 7,415 millions.

The e.h.p. lay-out of the line only differs from the usual practice in that additional tappings have to be provided

* Elec. Rev., April 7th, 1922, *et seq.*
† *Ibid*, September 4th, 1925.

en route. It will often be found advisable to utilise two (or even three) distinct routes at some considerable distance apart. One route might be the most direct between the towns; the second (and third, if required) should go through the centres of gravity of the anticipated rural demand.

The distribution system in the initial days of rural supply, in order to reduce line construction costs, will undoubtedly be worked with a greater voltage-drop during the day-time than would be permissible for city work. Fig. 1 is a typical load curve for an English rural distribution line.

On the Continent l.p. supply seems to be settling down to 380 volts, three-phase, 50 cycles, for power, with 220 volts between one-phase and neutral for lighting; in Great Britain favour is given to 400 volts, three-phase, 50 cycles, with 230 volts for lighting. The possibilities of single-phase rural distribution and the use of galvanised steel conductors are receiving very considerable attention.

To maintain the above-mentioned voltages, the countryside has to be set out in circular adjoining areas of approximately three miles diameter, each supplied from a 10,000-volt sub-distribution system, connected to the main e.h.p. distribution of 30 to 220 kV. At present a 25- to 50-kVA transformer is usually sufficient for each of these sub-stations. In most countries there is an average of 1¼ farms and 2 other consumers per mile of l.p. distributor. Each 10,000-volt transformer station will supply about 22 farms and 30 to 40 other consumers, including motors totalling up to 200 h.p. Though the load factor per motor is low, that per farm (the more important matter) is high, based on its maximum demand. It averages at present 35 per cent., giving a consumption of 90,000 units per annum, *i.e.*, 43,000 units per route mile of 10,000-volt distributor. As an example of e.h.p. distribution, assume two super-power stations, G and C, situated 50 miles apart, fig. 2, and connected by a 110,000-volt line. If the district was arable there would be an area of supply of about 2,000 sq. miles. On the basis of estimates made for city conditions, it would seem almost hopeless to think of attempting to supply such an area. However, if the work is carried out on the lines suggested in this paper, basing the distribution on the route length, it will be found that an annual consumption of 96 million kWh can be supplied by increasing the length of e.h.p. line to 200 miles. In addition, there would have to be provided five open-air sub-stations, 375 miles of 33,000-volt sub-transmission lines, and 500 miles of 10,000-volt feeders to the local l.p. sub-stations would also be needed. For the scheme set out in fig. 2, one e.h.p. line would go by the shortest route between the cities and two others would also be provided, one parallel on one side at an average distance of, say, 15 miles, and the other a similar distance away on the other side. Thus the five 110,000/33,000-volt sub-stations may be situated at the centres of gravity of the local demands.

It is assumed that the l.p. distribution network (380/220 or 400/230 volts) will be supplied by the local communities; hence, the power supply undertaking would have to consider only the cost up to and including the 10,000-volt sub-stations. Such a lay-out only requires one mile of 110,000-volt line per 30 sq. miles (19,200 acres) of land, plus a mile of 33,000-volt line per 8 sq. miles (5,120 acres) of country, plus a mile of 10,000-volt line per 6 sq. miles (3,840 acres) of ground. Ample provision of 33,000-volt lines is suggested, with a view to the supply of the ploughing and threshing loads.

Amongst the details that reduce the cost of overhead lines the matter that requires careful watching is so to design the line that most of the construction work on the poles, insulators, &c., can be done in the factory, not on the road-side where labour is so much more costly. The high cost of tapping e.h.p. lines at intermediate points is perhaps the greatest difficulty. Undoubtedly the best plan is to provide a sub-transmission line at, say, 33,000 volts, connected at both ends to the e.h.p. lines, giving in effect a ring main. From this 10,000-volt feeders can supply the 50-kVA sub-stations at 3-mile intervals along the rural routes. Very often it is advisable to employ intermediate distribution lines at 1,500 or 3,000 volts. Heavy loads which move from farm to farm or field to field as the work is finished are probably better connected to the 33,000- or 10,000-volt lines than to the low-pressure distribution system; the switches, protective gear, meters, &c., would be contained in portable transformer wagons.

In several parts of the Continent it is permissible to connect these temporary loads by hooks on to 33,000-volt lines. Excellent foolproof temporary connections are now availabl for 1,500 to 3,000 volts and also 10,000 volts, which can easil be used by the more intelligent farm hands. Their use mean a considerable saving in transformer iron-losses, the trans formers being cut out of circuit when not required.

The Farm Installation and its Uses.—Whilst the use o electricity is still a novelty in this country, nearly a millio farmers in other countries are employing it; over 500 Britis farmers are utilising it, and the number is fast increasing Over 200 uses for electricity have already been found o farms; the author has 67 on his own 600-acre farm at Eas Grinstead. Farm electrification means much more than bei ing a standard industrial motor to the existing agricultura machines.

The best insulated conductor for farm purposes, in th experience of the author, is "Maconite." This well with stands stable fumes and high temperatures such as that o a dairy steam boiler. When used in the open air, howeve exposure to the sunshine seems to dissolve out some of th gums in the composition.

To avoid accidents the type of hand lamp to be used shou be specified, and outlets for electric motors should be of a interlocked type, so that a plug cannot be removed o inserted unless the socket is dead. In Europe there is no an agricultural electric motor quite distinct from the indu trial type. Since the war such a large proportion of th output (75 to 90 per cent.) of electrical manufacturers' moto shops has been of the agricultural type, that such moto are now often supplied for industrial work, to the advanta of the factory using them.

The requirements are those of a mining motor, at the co of an industrial one. As lubrication is erratic, ball bearing should be used. A simple built-in overload circuit-breake should be provided, and any starter should also be enclose in the frame. The windings should be vacuum-impregnate so as to be moisture-proof. To keep down first cost, a internal ventilation system is essential. To avoid speci fixed wiring, a plug connection should be used for the cable The motor must be capable of working in an inverted o vertical position. The outside should be smooth and easi cleaned. Most farm motors can be started light, so tha they can be of the squirrel-cage type; it is quite commo to fit centrifugal clutches or sliding rotors to make startin still easier. Particularly in the larger sizes, wound-roto motors with automatic short-circuiting and brush-lifting d vices are useful, as they combine the advantages of both type

A 5-h.p. motor is the largest needed on most farms, excep for ploughing, provided the supply engineer is in a positio to recommend suitable farm machinery. If the farmer cann be persuaded to use small farm machines which can b operated by a 5-h.p. motor, he usually goes to the oth extreme and uses very large ones, such as a threshing machi combined with a straw presser, requiring a 25- to 40-h.p motor. When such a motor is used on a much smaller loa its power factor is very poor. To improve this, it may b fitted with a star-delta switch for the stator, the star positio being marked, say, "light load" and the delta positio "heavy load."

There are now a number of agricultural-type motors on th market which, by the use of self-contained compound-reductio gearing, can be coupled direct to the machine to be drive This saves much time by avoiding belts, which, in the han of farm labourers unused to them, give endless trouble. F motors of 5 h.p. and under, friction drives can be used inste of gear wheels.

Homestead equipment should be of the most robust an practical character. On some parts of the Continent to-da it is rare to find a farm without its electric washer, but has cost one-fourth the price of the admittedly better ty of washer available in this country. Electric cookers ha not yet reached the simplicity of the better-class gas cooke though hire and hire-purchase schemes have helped. Wat heaters are required in the kitchen and in the dairy; it advantageous to couple them with an auxiliary fuel-fir heater, and a small direct-coupled electric blower would assi in lighting a fire.

It is wise to submit to the farmer suggestions that enab him to improve his load factor and thus purchase electrici on the most favourable terms, *e.g.*, multi-way switchin whereby, when the current is in use on one important pie of apparatus, other current-consuming devices cannot

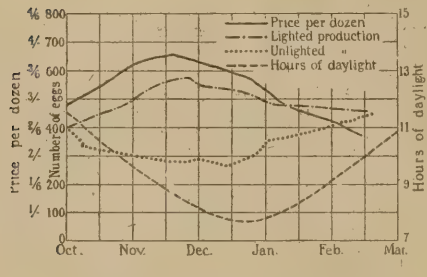

Fig. 4.—Gain in Egg Production due to Electric Lighting.

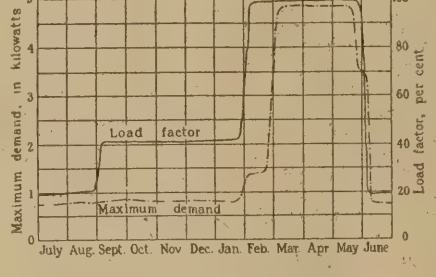

Fig. 5.—Load Factor of Poultry Farm.

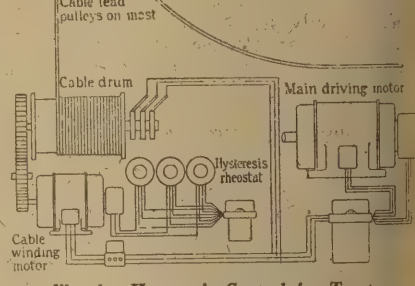

Fig. 6.—Hysteresis Control for Tractor-winding Motor.

switched on. When other appliances are not in use the current can be switched on to the water boiler; when the larger appliances are in use in the house, the motors in the farm buildings should be switched off. There is no practical objection to doing this, especially on the smaller farms, as it only requires a little rearrangement of the farm work.

At least half-an-hour per day per man can be saved in the feeding of live stock by the aid of a good light. Poultry-house lighting is now a recognised commercial practice, for the very good reason that there is an increase of 15 to 43 per cent. in the egg production during the winter months, when prices are highest, fig. 4. Contrary to the popular idea, the birds are not in any way strained as they get 10 hours' sleep each night. They are simply allowed ample time for feeding, instead of being partially starved owing to the long winter nights in this country. Fig. 5 shows typical curves of poultry-farm maximum demand and load factor.

The author has recently obtained new results of commercial importance to the market gardener in connection with the transplanting of seedlings, and one-night treatment of greenhouse plants to obtain more rapid progress.*

A novel application, which is still in the experimental stage at East Grinstead, is the electric lighting and heating of bees in the early spring. The hives are all placed inside a house, instead of being kept in the open air in accordance with the usual practice in England. The basis of the idea is that, by this treatment, strong hives are obtainable at the time when the orchards are in bloom, thus about an additional 17 lb. of honey can be obtained per hive per annum.

Earth currents, one of the earliest applications of electricity to agriculture, has lately been revived in a novel manner by M. Christofleau, in France. Confirmatory tests are at present being conducted in the author's garden. Further experimental work is, however, necessary to confirm the results obtained so far.

Work on the Land and Haulage.—So large a proportion of the power on a farm is used on the land that all parties should consider very seriously the best methods of cultivation by electrical means. If electric ploughing is carried out on a large scale, the power required is so great that for an economical distribution system the voltage must be fairly high. This is a point overlooked in most discussions on rural electrification; one very successful equipment uses 5,000-volt motors. Most of the successful plants are of large size, capable of ploughing up to 27 acres a day (a horse can plough barely an acre a day). The capital cost is high, and such an equipment is only suitable for contractors or co-operative societies. In practice an electric plough can be kept fully occupied for at least 200 days in the year, and this is quite a reasonable period over which to spread interest and depreciation.

Small electric ploughs are still in an experimental stage; the author has formed a clear idea of the most suitable type for the individual farmer. It must be controllable by one man and should be of the tractor type to obviate anchorages. Two electric motors should be fitted, one of about 25 h.p. for the main drive, and the other of about 2 h.p. for winding in the cable when it becomes slack.

Fig. 6 illustrates a very ingenious system of hysteresis control for a cable-winding motor, which is successfully employed on the Continent. The cable-winding drum is operated by the motor through a friction drive. When the tractor is driven away from the source of supply, the cable is drawn out against the friction drive, and when the tractor returns the cable is slackened. As the resistance to the motor drive is thus removed, the motor comes into operation and winds up the cable until it reaches a predetermined tautness. Owing to the hysteresis control, the operation of the motor is automatic; further, it will not burn out when the tractor stops or the cable drum reverses.

Major A. MacDowell has recently developed in Scotland an original form of single creeper tractor for ploughing, with which is incorporated a novel method of side-stepping the whole machine ready for the next furrow and also a new way of handling the flexible cable.

One of the practical difficulties experienced in connection with electric ploughs is that of transport from field to field, and also the fact that they cannot be used for general haulage work on public roads. The author's proposal is to equip a creeper-tractor with batteries and thus employ it as a vehicle for haulage on public roads, and also for haulage of timber and crops when it is not convenient to connect to an overhead line. Ploughing is the principal load on the farm. A tractor can also accomplish much other work, such as cultivating, harrowing, rolling, seed drilling, harvesting, &c., and nearly all the existing farm implements except harvesting machinery can be used.

Quite a new development is to reduce the resistance of the soil to the ploughshare by passing a current of electricity between the coulter† and the ploughshare. An actual lubrication effect is secured by making use of a special property of soils to produce, by electrical means, a film of water between the furrow slice and the mould-board of the plough. The water in the soil seems to move from the positive electrode towards the negative. This property has, in fact, been used as a preliminary method of removing water from peat, preparatory to drying in the usual way. The idea is due to the work of Messrs. E. M. Crowther and W. B. Haines, of the Rothamsted Experimental Station, who have carried out a good deal of laboratory work in this connection, and eventually a full-scale series of tests at Greater Felcourt Farm, East Grinstead. Laboratory tests have shown that the friction under favourable conditions can be reduced by as much as one-third. These results have also been corroborated by Captain B. J. Owen in connection with mole draining.

It is impossible to say whether or not ploughing is actually an essential operation in farming, and there are now a number of machines in existence which attack the problem in quite another way. Just as the milling machine has superseded the planing and shaping machines in the engineering workshop, so it seems likely that the rotary tiller will have very many advantages. Certainly the action of ploughing seems very unmechanical in that really the ground is wedged over, which has a tendency to produce the very pan to which so many farmers object; also the rotary tiller lends itself conveniently to an electric drive. The earlier designs of these machines produced a fine tilth, which was apt to set down solidly after the first shower of rain; however, improvements in the construction of the tines, or teeth, enable both weeds and manure to be buried and the soil left in the form of clods.

Then there are many ways in which, by the aid of electricity, the farmer can circumvent the clerk of the weather and expedite work generally, and a few years ago a commencement was made in the manuring of Swiss fruit farms by means of stand pipes in the orchards, supplied by underground pipes and electric pumps from a tank adjoining the main buildings. The author's opinion at that time was that although this method might suit orchard or market-garden practice, the installation would be too expensive for ordinary farm work. The process, however, saves so much labour, both of horses and of men, that it is being adopted in general farm practice. The mains thus used for manuring the fields with liquid manure can, of course, also be employed for watering them in exceptional seasons of drought. The consumption of electric current for liquid-manuring and watering in accordance with this process amounts to 90 units per acre.

To obtain the utmost advantages from electricity the farmer will have to be asked to do many things in new ways. It is of vital importance to the whole nation that agriculture should be placed on a sound basis, and on this account alone the question is well worthy of the most serious investigation by the electrical engineering world.

* See Elec. Rev., October 30th, 1925.

† The coulter is either a disk wheel or a cutting wedge which opens up or cuts the surface of the soil to facilitate the work of a ploughshare in turning over a furrow.

Rural Electrification in France.—An investigation concerning the utilisation of electrical energy in rural districts and its possible development has been made on behalf of the Ministry of Agriculture by M. Froust, engineer, of Grenoble, in the case of the Isère department. This region comprises 564 communes, of which 280 were provided with a supply of electricity in 1920, while constructional works are now proceeding in a further 200 communes. The annual consumption for lighting purposes varies between 15 and 17 kWh per inhabitant. Certain hamlets which are outside the area of general distribution propose to bear the cost of the erection of supply lines. The use of electric motors for various operations on the farms is increasing for cutting straw, pumping, sawing, elevating, and for the driving of thrashing machinery, the size of the motors being usually from 2 to 3 h.p. The number of hours of use per annum is very small, averaging about 100. As a result of the growing extension of electricity supply a development is taking place in silk weaving, where besides weaving mills having from 20 to 30 looms, domestic weaving is carried on with from two to ten looms, although mostly with six. The development of domestic weaving is said to be encouraged by the employers; the motors used for these purposes are from 0.33 to 0.5 h.p. for individual drive and of larger powers for groups of looms, although the individual drive is said to be usual. The annual use of these motors represents about 2,000 hours or 20 times that of motors employed for agricultural requirements. The extension of domestic weaving tends to keep the female population from migrating to the towns. It is further stated by M. Proust that the development of electricity supply has been the means of the establishment of a new industry in the form of the manufacture of electrical apparatus, for the production of which small factories of about 12 workmen each have been opened at Pont en Royans, Choranche, Rencurel and Chapelle-en-Vercors.

Steel Production Direct from the Ore.—A large steel furnace is being completed at the Swedish works of the Uddeholm Company, with the assistance of the Swedish Iron-masters' Association, for the production of electric steel from iron ore, according to a method devised by Mr. Flodin, and it is expected that the furnace will be set in operation in March. This engineer read a paper on his process at the meeting of the Iron and Steel Institute in London last September, when it was suggested during the discussion that the method was only suitable for the production of the highest qualities of steel, and that the high charges for electric power in Great Britain would render it impossible to use the process in this country. The actual capacity of the new furnace has not yet been disclosed, the directors of the company preferring to await the working results before giving any information on the subject.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Improved Circuit Breakers.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2, has recently introduced a new range of R.A.T. circuit breakers, specially designed for the efficient protection of lighting and power circuits of up to 100-A loading at up to 660 V. They embody the usual automatic overload and no-volt releases and are made in the open type (fig. 1), mounted on enamelled slate bases, or in the factory type (fig. 2), enclosed in asbestos-lined cast-iron cases with inspection windows and external operating handles in either single-, double-, or triple-pole patterns.

The no-volt coil is claimed to operate when the pressure is reduced to 65 per cent. or less of its rated value, or with the

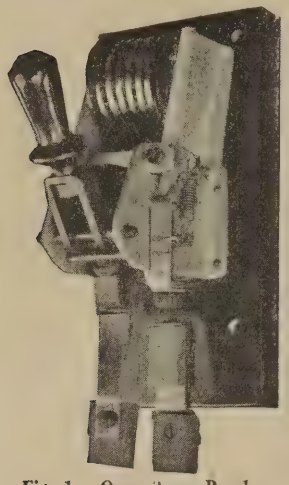

Fig. 1.—Open Type Breaker.

Fig. 2.—Factory Type.

rated frequency maintained it will release when the pressure drops to 75 per cent. It is self-resetting with the pressure value at 90 per cent.

These breakers can be set to operate on currents up to 100 per cent. above normal, the scale being marked at three points which represent normal, and 50 per cent. and 100 per cent. above normal. A loose-handle provision prevents the breaker being held closed against abnormal conditions, and an anti-hesitation device ensures that the handle must be carried through the whole travel into the full-on position, when closing the circuit breaker, otherwise the latter will immediately open if there is any hesitation in closing.

A Novel Electric Water Heater.

The accompanying illustrations, figs. 3 and 4, show an electrically heated boiler which has been recently marketed by Messrs. Jackson Boilers, Ltd., 83, Kirkstall Road, Leeds. It is designed for self-feeding, direct from the main water

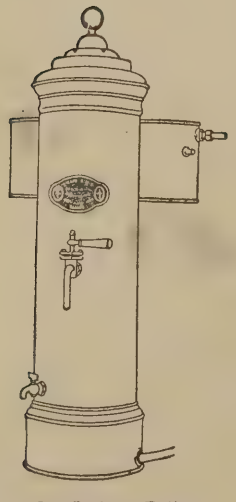

Fig. 3.—Jackson Boiler.

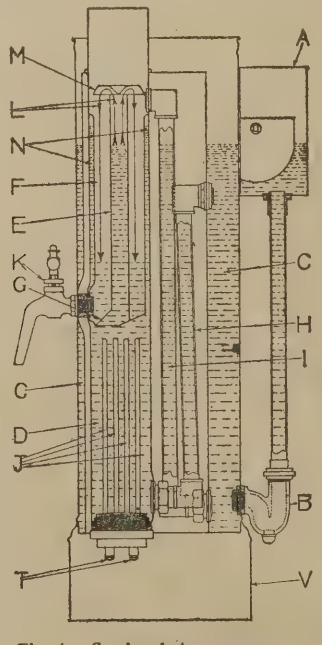

Fig. 4.—Sectional Arrangements.

supply, and to give an immediate supply of boiling water in quantities sufficient for the reasonable requirements of the catering trades. The supply water is controlled by a standard ball-tap valve, and by an ingenious combination of boiling-water-storage and pre-heating arrangements, boiling water in reasonably large quantities, it is claimed, is always available. Fig. 4 shows sectionally the arrangements of the boiler. The water is fed from the ball-tap cistern A, *via* the trap B, the shell C, and the feed pipe H to the boiling chamber D, in which are located the blades J of the immersion heater.

When it is raised to boiling point the water ascends the expansion pipe E and is deflected by M into the collecting chamber F. Boiling temperature is maintained here by the jacket N, an extension of the boiling chamber. The bottom of the collecting chamber and top of the boiling chamber, G, is specially shaped to deflect steam to the jacket N and to the expansion pipe.

If the water is not drawn off as it boils it fills the collecting chamber and overflows through the pipe I to the bottom of the outer shell C, thus heating the contents of the outer shell so that a bulk of hot feed water for supplying the boiling chamber is available when required. The supply leads are taken to the immerser terminals T through a hole in the base V.

It is claimed that very large quantities of boiling water can be maintained simply by increasing the capacity of the outer shell. With a loading of 4½ kW boiling water is said to be obtainable in four minutes after switching on, and afterwards at the rate of 72 pints per hour when the whole contents of the boiler are fully heated.

A New Electric Lighting Fitting.

A new range of electric lighting fittings, cylinder units, has been introduced by Messrs. Smith & Ansell, Ltd., Stockfield Road, Acocks Green, Birmingham. This fitting is designed to embody the advantages and eliminate the disadvantages of the bowl and enclosed types of fittings. Fig. 5 shows one pattern of the range, SA-3,202; it is suitable for a 40- to 100-W gasfilled lamp. The cylinder is 6 in. in diameter, and that of the white vitreous-enamel finished reflector is 15 in. The feature is a glass cylinder which surrounds the lamp vertically, and is supported by means of an external flange at its top. The cylinder is of special diffusing glass for about two-thirds from the bottom, the upper portion being clear. Various forms of reflectors and suspension gear are used in other models, and the principle of cylinder lighting can be employed in decorative forms if desired. The advantages claimed for this type of fitting are that dirt collection is largely obviated, glare is avoided, a minimum of light is lost through absorption, immediate access to the lamp is provided, and there are no loose parts. A neat and convenient means of suspension is offered by means of a ceiling plate fixed direct to the conduit box, &c., affording an easy inspection of connections and rapid erection. A central wireway suspending chain is provided.

An Emergency Igniter.

An interesting and simple device, the auto-igniter, designed to serve the motorist as a stand-by means of ignition in the event of a complete break-down of the usual electrical ignition, has been marketed by Messrs. F. A. Wilkinson & Partners, Ltd., Gretton, near Kettering, Northamptonshire. It consists of a number of units, fig. 6 (corresponding to the number of cylinders) one of which is screwed into each cylinder in the place of the sparking plug or into a tee piece between the plug and the cylinder, so that the two devices can be used in conjunction. Each unit or cup is fitted with a special type of electric heating element contained in a screw-in cap fitted with the necessary terminals. The element is connected

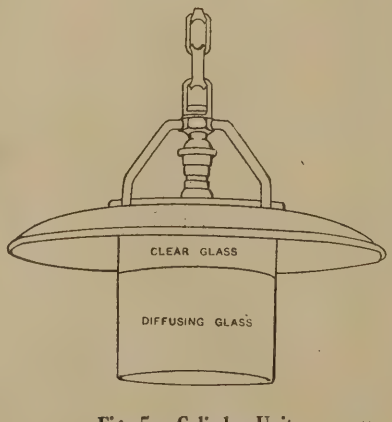

Fig. 5.—Cylinder Unit.

Fig. 6.—Emergency Igniter.

through a switch to the car or other battery, which can be switched off when the sparking plug commences to function. The device should be particularly valuable for motorists when touring, and for isolated generating plants in the country or Colonies.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

"Electrical Freedom."

As a contractor who has been in business for over 25 years, I am just as amused at Mr. L. L. Robinson's article as he appears to be at the pamphlet issued by the Electrical Contractors' Association.

Most contractors would be very pleased to accept work at 20 per cent. on cost. What does Mr. Robinson mean by this? Does this 20 per cent. cover establishment charges as well as profit, or is he offering 20 per cent. profit after establishment charges have been added?

What is the cost? Who knows it until the job is finished? We all do our best to estimate the cost, which is a very different thing.

The trouble is that the supply authorities think wiring is an easy job and estimating easier, whereas the experience of most contractors is that estimating to be correct can only be done after years of experience.

I may quote an example in my town, where they have recently opened an electrical showroom and are hiring out cookers; the city engineer has been offering cooker wiring to contractors at a price at which the work required cannot be done, and when an interview was sought with the city engineer he admitted that the price he fixed for the work was not quoted out of any data at all. It was merely a figure which they thought would be satisfactory, and in any event the offer to do a certain amount of free wiring was more or less "a sprat to catch a mackerel." Is this fair trading? The showrooms now being fitted up by municipalities cannot in themselves be run as commercial concerns. If contractors could force municipalities to keep their costs for running the showroom, including establishment charges, proper apportionment for rent, supervision, &c., and salaries of staff, we would soon show who could do the work cheaper. Mr. Robinson cannot run a showroom and carry out wiring cheaper than a well-organised electrical contractor who has reasonable establishment charges.

As regards Mr. Robinson's statement that contractors put wires in so small to lighting points that irons, kettles, cleaners, and radiators cannot be used, we have yet to learn that an iron or kettle or a cleaner cannot be used on 1/.18 or 3/.029 wires.

In conclusion, the article obviously shows considerable bias.

Fair Does.

March 2nd, 1926.

The article which appears in your current issue under the title of "Electrical Freedom," by L. L. Robinson, M.Inst.C.E., will probably be commented upon and should not pass unnoticed. One is inclined to ask: "When is it possible for Mr. Robinson to speak well of the electrical contractor?" At all events, it is high time that this engineer should encourage the efforts made by the E.C.A. and others to raise the standard of contracting work. The attitude taken is more likely to arouse a controversial spirit antagonistic to the end which he himself has in view. Granted that the pamphlet referred to has a streak of humour—the levity shown in his own article does not help to create the correct understanding of the difficulty.

We will allow that this supply engineer is making a satisfactory advance with the sale of "juice"—but we will not admit that he is equally successful in selling electrical goods. Are the goods sold price-maintained? Are the goods bought at factors' prices or ordinary trade terms? What is the equity of the sale in comparison with a ratepayer offering the same article? Mr. Robinson may claim that he sells the article and so increases the call for current—but will he also answer to the claim that he has closed his eyes to the usual trade observance as between manufacturer and retailer—or, in plain English, does he cut out the middleman? The local conditions may or may not be desirable; that hardly concerns the public. We simply point out that any difficulties at Hackney do not call for a wholesale condemnation of the electrical contractor.

It is well to remember that there is a large number of electrical contractors throughout the country, firms of standing who have large staffs with attendant heavy wages accounts—these are established firms of integrity and resource who would scorn the impeachment of undersized cable and other mean and underhand practices. These firms would find more prosperity and sound business if the station engineers would confine themselves to electricity supply, reducing their steam-raising costs, works costs, and supply services, in order that electric current should be popularised.

The supply engineer invariably gives encouragement to the blatant and showy advertiser whatever the merits of the article he desires to sell—vacuum cleaners, kettles, and other consuming devices. Why blame the contractor for neglecting this source of income? The contracting firm has a host of competitors—the large stores, the furniture dealers, and others, as well as the "hucksters" and "trade touts" who call daily upon the householder.

The supply engineer who follows in the path clearly shown by the late chief engineer of the Glasgow Corporation will develop electricity supply and establish his own reputation by realising that the established electrical contractor is the surest agency for this development. May we appeal to our supply authorities to employ established firms who have a reputation to lose and who have the resources to carry out any class of installation work, in place of pandering to the cult of the "bottom price" and indifferent workmanship?

The station engineer has apparently forgotten that in bygone days he also has proved a hindrance to the advance of electricity supply and has harassed the contractor by framing regulations which have served no useful purpose. Finally, we trust that the present intention to compete for the trade of the contractor will be defeated. It is unthinkable that Parliament will permit a station engineer to act as the inspecting authority to the electrical contractor who is a ratepayer in the district whilst the supply authority is in direct competition for the same business.

"The Pilgrim."

March 2nd, 1926.

I was much amused by Mr. L. L. Robinson's magnificent article in the current REVIEW, but I quite fail to get his meaning.

In arguing the case for municipal retail trading, Mr. Robinson completely ignores the vital objection, that of a municipal body entering into competition with its own ratepayers, and blatantly defends his position by implying that electrical contractors are incompetent, inefficient, and generally out to swindle would-be consumers.

As proof, Mr. Robinson tells us he lives up in the air and cites the case of his water supply; apparently his plumber did those things he ought not to have done and left undone those things he ought to have done, with the result that when Mr. Robinson says "Let there be water," there is not water, or, if there is water, it is in the wrong place.

I freely admit that this is a very good argument in favour of municipal supply authorities selling 27 vacuum cleaners per week, but, also, is it not a clear case of accepting the lowest tender from anywhere, or anyone, instead of having a correct specification drawn up by someone duly qualified?

As a matter of fact, I live on the ground floor, in quite a nice little house—with the possible exception that the wife thinks the wallpaper in the second bedroom rather bright—and all our water work was carried out by an existing plumber—I should hate to have work done by a plumber who did not exist—with the result that when the bath tap is turned, out comes the water, beautifully clear, warm, and wet, and not a drop runs into the bath of Jones on the other side of the road. This, according to Mr. Robinson, is a clear case against the practice of retail trading by municipal supply authorities.

Mr. Robinson states that "in my area the united efforts of the retailers did not connect four vacuum cleaners per month to my mains." Is Mr. Robinson absolutely certain this should not read five? I only mention this because I once sold a vacuum cleaner, it was quite a long time back—before the war really—and, believe me (of course, this is in strict confidence) to this day our supply authorities are unaware that that cleaner was ever "connected to their mains."

Try to visualise an electrical contractor connecting even one vacuum cleaner to the mains of Mr. Robinson, M.Inst.C.E.: what a subject for Mr. Robinson H.E.A.T.H.

Bleats Mr. Robinson (the M.Inst.C.E. one), "Who is going to sell my product fast enough to make it ever cheaper? The contractors have not done it in the past." "ROT!" shouts Mr. Contractor, "I have built up the industry for you, and for fifty years have consistently advertised and sold your product, making your stations what they are to-day."

Mr. Robinson very definitely implies that all contractors put in wires too small, therefore, I can only infer that all municipal supply authorities who undertake wiring, carry out their work flagrantly against all rules devised for public safety, namely, generally wire houses and even business premises with unprotected rubber-covered cables threaded through the joists between floors and ceilings, as described by a disgusted wireman, on the "one knit and two purl" principle, the only protection accorded the whole system being casing and capping for actual surface runs, presumably to prevent consumers using the cables for airing purposes.

At least, that is how thousands of premises are wired by our municipal supply authorities, the same kind of work being carried out by local contractors, not because they prefer to skimp, but simply because such work is recognised as the standard for house wiring by the municipal authorities themselves.

Yes, Mr. Robinson, thousands of houses wired with unprotected rubber cables run through the joists, and the work carried out by one of the cannot-do-wrong, all-for-public-safety, municipal suppliers; and, because the work is carried out by such, it is passed by fire insurance offices, offices which flatly refuse to pass similar wiring for a 1-kW plant outside our supply area "because it is not safe."

For goodness sake, Mr. Robinson, get a piece of india rubber—and rub yourself out.

Registered Contractor.

March 2nd, 1926.

I envy Mr. Robinson his temperament. How delightful a place must appear this unhappy world to one who can find humour in the struggles for existence of his fellow workers. The spider, merry fellow, gloating in a corner of his web, no doubt finds humour in the quaint antics of the enmeshed

fly. The jolly murderer, standing on the bank, hands thrust deep in his fur-lined coat, probably finds the floundering of his victim in the ice-cold water excruciatingly funny. Mr. Robinson, not content with laughing at him, throws verbal brickbats at him. He tells him—the electrical contractor—in effect that he is slow, inefficient, greedy, and not too scrupulous. He sneers at the title of the E.C.A. pamphlet, at its very colour.

What is his objection to "Electrical Freedom" as a slogan? Would he deny to the unfortunate contractors the freedom to earn their living? It is all they ask. Does he consider them so very unreasonable in pleading for freedom from the artificial, unfair, rate-aided competition of public suppliers of electricity; for the same freedom to ply their trade as other ratepayers have?

Mr. Robinson argues both ways. He argues that water being an absolute necessity must obviously be a public supply. Nobody is likely to contradict him. He also argues that electricity, *not* being an absolute necessity, must also be a public supply. On the same reasoning the French have made railways and matches public supplies. The fatal results, so far as railways are concerned, can be read in every other day's paper; and, as for matches, any man brave enough to smoke French tobacco—another State monopoly—must keep a candle-end burning to light it as we did in the dug-outs.

Since anything, according to Mr. Robinson, which either is or is not a necessity may fairly be made a public supply, then are the Bolsheviks justified! So is the policy of our own Communists. Water, gas, electricity? Why not coal—as nearly a necessity as artificial light? Why not railways and general transport? Why not land and all the means of production? Why not, in short, the whole programme of Socialism?

Mr. Robinson's argument goes on thus: Granted electricity supply should be in the hands of public authorities, then they are justified in seeking control of all subsidiary services. They are not only entitled to have the monopoly of supplying electricity, but of supplying the installations to which their supply is supplied; and the vacuum cleaners, and the fittings, and the lamps, and the pretty little silk shades. (Beware, ye drapers! 'Tis but a step from silk "flounces" to silk petticoats!) One wonders why they should stop at installation work and fittings. The obvious logical development is to *manufacture* the wire and conduit and fittings necessary to the installations necessary to the supply; and, a little further, vacuum cleaners, fans, motors, generators, turbines, boilers and—well, pretty well everything!

I do not know who Mr. Robinson is, but I gather from his article he is a public supply engineer, perhaps in the Metropolitan area: one of the vast and ever-growing army of bureaucracy which is slowly strangling British enterprise and independence. Democratic bureaucracy is but another aspect of Socialism; so that his opinions are natural enough to one in his position. But they are not yet, thank heaven, the opinions of the bulk of the British public; nor, I venture to say, of any but a small, self-interested minority of your readers. The others—not only the thousands of contractors to whom the Review has always been the standard of freedom of, at least, opinion—but the wholesalers, and the manufacturers, and everybody else connected with the electrical trade whose prescience foresees the threatened monopoly of the municipalities: all these, if they are wise, will energetically support the contractors' modest plea for the right to exist. They are in the van of the fight against communistic competition. They need—they deserve—the support of all who are not Bolsheviks, nor bureaucrats.

The E.C.A. pamphlet makes, to my mind, too great a concession to the public supply engineers in professing the belief that the supply of electricity should be under State or semi-State direction or regulation. Under State discipline, yes, as is, ultimately, every enterprise in the kingdom. But not, necessarily, under State or municipal monopoly. On the contrary, private companies can and do supply electricity as efficiently as any corporation, with all its adventitious aids and non-commercial advantages.

Conceding to Mr. Robinson, however, as much as have the E.C.A., it does not follow as axiomatically as he seems to think it should, that they should concede to him control of their own work. If he can prove that "the municipalities give the cheapest and most efficient supplies of electricity," he has still to prove that "they or the companies" can "likewise supply the cheapest and most efficient installations and service to consumers." It is a very different matter. He asks for "any sound reason" to the contrary. There are a score that the E.C.A. could adduce; but it is for him, first, to find any reason, beyond the mere greed and self-sufficiency of Bumbledom, for curtailing the already restricted field of the electrical contractor.

Mr. Robinson builds what case he has on the alleged deficiencies of certain contractors. He says: "Do not contractors for electrical wiring . . . put in wires so small to lighting points that . . . they are found wanting," and so on. He accuses them—those, at least, in his area—of slackness and inefficiency, of timidity, of lack of energy and imagination. These sweeping criticisms may, or may not, be true of the contractors in his area—the probable explanation being that the wiser contractors have long ago left it; they may be true of certain "contractors" elsewhere—I have said harder things myself, in your pages, of the jerry wireman; but they are not true of electrical contractors as a whole. They are as able, and as likely, to wire a building adequately as any spoon-fed municipal wiring department, in spite of the fact that they have to do so in the face of competition from which the department is usually exempt. The contractor's canvasser is as keen as any municipal employé to sell vacuum cleaners and other electrical devices. The contractor himself is at least as anxious to secure new business as any supply engineer can be. Human nature being what it is, which has the greater incentive to do so: the contractor whose profit, whose very existence, depends on his energies; or the public employé, with fixed salary, whose interest—on behalf of his nebulous paymasters, the ratepayers—is only a varying function of his sense of duty?

I hold no brief for the E.C.A., with whose policy I sometimes find myself in imperfect sympathy, and I have no doubt the pens of their experts are already dealing more adequately than I can with Mr. Robinson's attack. I write simply as one who, after a quarter of a century's experience in the contracting trade, sees its very existence threatened by the strangle-hold of rate-aided municipal Socialism. But I venture to suggest, from my experience, one or two questions that the E.C.A. could, with advantage, put to Mr. Robinson.

For instance: Is the specification of the work he gives out to registered contractors in his area in accordance with the I.E.E. rules? If not, how far does it fall short of them? I have known corporation wiring work standardised on the lines of unprotected V.I.R. cables run through bored joists.

What is his calculated cost per average lighting point? What, if any, allowance does he make therein for rent, rates and taxes, salaries, and other standing charges? What is the price per point at which he offers this work to contractors?

If there is, as he says, a margin of 20 per cent. profit thereon, why is he not consistent? Why does he not have the work done by his own men, and so save the profit for his ratepayers? If, on the other hand, there is *no* margin of profit—and that seems to be the opinion of his local contractors—why is he so surprised and aggrieved that they don't "scramble" for his orders? There's some nigger in the woodpile. Contractors turn up their noses at 20 per cent. profit no oftener than supply engineers make them a present of it!

Finally, Mr. Robinson boasts a little of his selling successes—it would be interesting to know how many washing machines and bath water heaters he has *sold*—not hired—during the last year. It is possible that the actual figures will prove less impressive than the bare names; unless the consumers in his area have either fuller pockets, or softer heads, than they have, for instance, in the Eastern counties.

I have no doubt that Mr. Robinson, personally, can give perfectly satisfactory answers to all these questions. I put them down haphazard, with nothing, in my ignorance of himself, his area, or his activities therein, to guide me as to the possible answers. But this I know, and so does every member of the E.C.A.—not one in ten of the other supply engineers throughout the country who compete with their local contractors could, within the limits of truth, satisfactorily answer that short catechism.

H. R. Taunton.

Norwich, *March 2nd*, 1926.

Proofs of the above letters were forwarded to Mr. Robinson, so that his reply could be published simultaneously. He writes as follows:—

I have read the correspondence relative to my article with a sense of great disappointment.

My article was intended to be provocative—I hoped it would bring forward some really useful suggestions for the good of the electrical industry—some suggestions for wholesome co-operation—a change from the old attitude of so many of the numerous but less important contractors which is by no means the attitude of the few and better class contractors, to one which would lead to the supply industry helping the contractors and to the contractors lending their loyal support to the supply industry, both bearing in mind that their first duty is service to the public.

Instead of this the correspondence is composed mainly of senseless vituperation and little pin-prick details—a discussion on the pros and cons of municipal trading.

This is not a question of municipal or private trading.

The real question is whether a supply undertaking, whether company or municipal, should carry its service right through to the consuming apparatus in order that the consumer may receive perfect results or whether it should stop short at the meter.

The experience of the gas companies at home and of the electricity companies abroad, especially in America, is that the supplier of the electricity or gas must see his job right through. (*a*) by co-operation with the contractors if they will co-operate on reasonable terms, or (*b*) without them if they won't.

Mr. Taunton's letter illustrates an unfortunate attitude of mind. He says: "What is his objection to 'Electrical Freedom' as a slogan? Would he deny to the unfortunate contractors the freedom to earn their living? It is all they ask. Does he consider them so very unreasonable in pleading for freedom from the artificial, unfair, rate-aided competition of public suppliers of electricity; for the same freedom to ply their trade as other ratepayers have? To this I reply: Why deny to the electricity supply authorities the freedom to accelerate the rate of the development of their electric supply? Is not that what the Government and all of us ought to be out for?

To conclude, may I reiterate that so far as I am concerned this is not a question of municipal or private trading. For my

ns, I suppose, I happen to be a municipal engineer, but this as not biased me in favour of municipal trading. I am a nareholder in many company undertakings. On the contrary, feel sure that we workers in the industry would have been etter off if there had been less municipal trading in electricity ıpply, though statistics show that probably the public would ave had to pay more for their electricity. But I say that if is wrong for the municipal suppliers to give service right up the consuming devices, then it is wrong for them to have nything to do either with supply, service, or equipment. lowever, if municipal trading in electricity is what the public ant, then to be as nearly perfect as possible the municipal ıppliers must have electrical freedom to give the consumer eir best and unrestricted service.

L. L. Robinson,
Borough Electrical Engineer.

Hackney, *March 6th*, 1926.

I have been amused to read Mr. L. L. Robinson's article on Electrical Freedom—The Contractors' Creed," in your issue February 26th.

As a direct consequence of intensive installation and retail les competition on the part of his undertaking, Mr. Robinson as very largely succeeded in driving electrical contractors out his territory. To-day he turns round and complains that ntractors in his area are not up to the mark—that they are ing no business! I know, of course, how Mr. Robinson ughs up his sleeve at the whole position; but the laugh is t all on his side.

Has Mr. Robinson heard of the position in Glasgow, Manester, Birmingham, or the North-East Coast? In all these eas there are crowds of electrical contractors doing excellent siness. They are working hand in glove with the municipal ithorities and power company (Newcastle) concerned. How mes it about that the *reverse* situation prevails in Hackney? as Mr. Robinson never put the question quietly and seriously *to himself?* And has Mr. Robinson been privileged to hear hat the general electrical trade (manufacturers and wholelers) think of the Hackney situation as compared, let us say, ith the Glasgow situation? I am afraid, Sir, that you would e unwilling to print some of the expressions employed!

Mr. Robinson disputes the illustration used in "Electrical reedom" concerning the sale of pipe-lines, kettles, baths, and on, by existing water boards and authorities. Not content point out that water is an "absolute monopoly," Mr. Robinon proceeds to condemn existing plumbers and all their works. n support of this he describes certain bad plumbing (executed y private firms) in his own third-floor flat. Surely, however, ie plumbing work in Mr. Robinson's flat was designed by the rchitect or builder? Why blame the plumber (probably opering on a cut price) for the shortcomings of the architect, conltant, or builder? The point is of great importance because dvocates of the Robinsonian point of view are for ever deanding better (more convenient) installations, and at the me time, are for ever demanding that the cost of installations all be reduced to lower and lower levels. How can we have enty of "convenience" outlets, multiple switching, and more copper in house-wiring" (as recently advocated) unless ie consumer (ultimately, or by some means) is prepared to ay for them?

Mr. Robinson says that he is anxious to put wiring work in rivate hands, such work to show "at least" a 20 per cent. rofit on *his* costs. Will Mr. Robinson please publish his costs gether with his schedule of prices for the general edification nd, perhaps, instruction) of the trade?

Awaiting these figures,

T. E. Alger,
President, The Electrical Contractors' Association (Inc.).

London, *March 3rd*, 1926.

[Mr. Alger's letter, though dated March 3rd, was not ceived until March 6th; it was therefore too late to be plied to in the above communication by Mr. Robinson.—DS. ELEC. REV.]

Engineers' Salaries.

I was very interested in the recent discussion in your lumns on the salaries of combustion engineers, and I should ry much like to have your readers' opinions on the follow-g:—

I am an engineer in charge of a factory not far from ondon. I am responsible for the running, upkeep, and aintenance of steam, electrical, and Diesel plant, and all her machines in the factory.

The horse-power of prime movers equals 1,300 h.p. In addion, I have under me a large staff of fitters, carpenters, inters, labourers, &c., about 40 men in all.

I have had a wide experience in mechanical and electrical ngineering. I have had a few years at sea, 14 years' centralation work as chief and assistant, and I have been in my resent position nearly 10 years.

I have as a so-called assistant a man some years younger an myself, who knows very little about steam plant, nothing out electrical machinery, and, from my point of view, is very little use to me. Moreover, he has only been with e about two years, having been engaged not by me, but by ne of the firm. Recently, I learnt by accident that he was in ceipt of a salary only £70 a year less than I am receiving.

What do your readers think my salary should be in view of the above experience, and what would they consider a comparative figure for my assistant?

A. C.

London, *March 6th*, 1926.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

The Electricity Bill.—On March 8th, Mr. BALDWIN stated that before the House separated for Easter he was very anxious to get the Electricity Bill through its second reading. The earlier the Bill got through that stage the better, because there would be an enormous amount of work to be done in the Committee stage. If they could not get to the second reading before the end of the month there ought to be no difficulty in getting to it immediately the financial business was out of the way.

Mr. RAMSAY MACDONALD said that it was absolutely essential that the House should have full time to consider such a measure as the Electricity Bill. The second reading should only be given after very generous time for debate.

Cable Contracts.—On March 8th, Sir W. DAVISON asked Col. Ashley whether the Ilford Council had recently placed orders in Germany and Belgium for electric cables and if such orders should not be kept in the country in view of the state of employment.

Col. ASHLEY said that he had no information on the subject.

Mr. DUNNICO said that the difference between the lowest British tender and that accepted amounted to £1,000 representing a halfpenny rate in the district. He considered that the Cable Makers' Association was exploiting the country.

Municipal Electrical Trading.—The electrical contractors are again opposing, in the present session of Parliament, the insertion of a clause in municipal Bills giving power to municipal electrical authorities to provide and deal in fittings and apparatus, and to wire premises. A similar clause was opposed last year by the contractors in the case of one or two Bills (see ELECTRICAL REVIEW for August 7th, 1925, p. 214).

In the present session the clause has been inserted in the Doncaster, Swindon and Guildford Corporation Bills, and petitions have been deposited against these Bills by electrical engineers and electrical contractors, and other ratepayers in the three boroughs. On March 3rd the Court of Referees of the House of Commons, over which Mr. J. FitzAlan Hope (Chairman of Ways and Means) presided, was to have considered an application by the Corporations concerned for a ruling that the petitioners had no *locus standi* and should not be allowed to oppose the Bills. By the time the matter reached the Court, however, agreements had been come to in all three cases. The Corporations concerned had admitted the right of such of the petitioners as were electrical contractors to be heard on the question of competition only, but denied the right of individual ratepayers to be heard. The Court was therefore asked to register the agreements, and this course was agreed to.

Railway Bills.—On March 4th, Mr. BARNES, a Labour member, moved the rejection of the London Electric and Metropolitan District Railway Companies' Bill, and criticised the administration of the railway and the fares charged in the East End of London.

Mr. KIRKWOOD urged the Government, in conjunction with the railways, to convert the underground railway system of Glasgow, where the motive power was steam, into an electrical system for 30 miles in and around the city. This, he said, would give employment to a number of engineers, and make the underground journeys more congenial.

Mr. FIELDEN said that that question was having the attention of the London, Midland and Scottish Railway Company. Such a scheme would undoubtedly help unemployment. He could not say, however, that the change-over from steam to electricity would take place in the immediate future.

After some discussion the Bill was read a second time, as was also the London, Midland & Scottish Railway Bill.

Legal.

Bonnella v. Espir.

MESSRS. ARTHUR BONNELLA and George Thomas Bonnella, electrical engineers, of 11, Bucknall Street, Bloomsbury, W., applied in the Chancery Division on March 5th, before Mr. Justice Russell for an interim injunction till trial to restrain Camille Espir, of 19, Hanover Square, from infringing the English letters patent, No. 26,635 of 1913, for electrical hanging switches.

The plaintiffs, said their Counsel, Mr. Cripps, were very considerable manufacturers of electrical fittings, manufacturing under this patent ever since it was created. Their switch contained a spring plunger terminal and other parts which were fitted into a hollow cylinder.

Mr. TREVOR WATSON replied that the defendant sold something substantially different as agent for the foreign-made

switch which was in question, and if he were restrained his business would be taken away and his agency would go elsewhere. Defendant's experts made out a *prima facie* case that there was no infringement and that the patent was limited to certain definite integers, and these were not to be found in the defendant's switch. The defendant's switches did not have spring plunger terminals.

Mr. Justice Russell said that to succeed with an interlocutory application the plaintiffs must establish a strong *prima facie* case, both with regard to validity and infringement. As to validity they succeeded. As to infringement, in none of their affidavits was to be found a direct allegation of infringement, and the defendant's expert, on the other hand, had established a *prima facie* case that the plaintiffs' patent was a limited patent. Plaintiffs had failed to discharge the onus laid upon them to secure an interim injunction, and there would be no order except that the costs in the motion should be costs in the action.

Empson Centrifugals, Ltd., v. Chadburn and the De Laval, Chadburn Co., Ltd.

An action brought by the plaintiffs against Mr. W. Roy Chadburn and the De Laval Chadburn Company, Ltd., to recover damages for alleged libel, came before the Lord Chief Justice and a special jury on March 3rd.

The plaintiffs alleged that in a letter to a firm of solicitors the defendants libelled them by stating that there was a doubt about their financial status and in two pamphlets to customers the defendants endeavoured to injure and disparage the plaintiffs' business by implying that the plaintiffs were fraudulent traders who sold goods which they knew to be worthless.

The defence was that the letter was privileged and that the pamphlets did not refer to the plaintiffs at all.

Mr. Raynor Goddard, K.C., for the plaintiffs, said that the parties were manufacturers of a centrifugal machine for extracting water and impurities from heavy used oils and were serious trade rivals. Mr. A. W. Empson had been agent for the defendants and afterwards opened business on his own account. He complained that Mr. W. R. Chadburn wrote:—"We have very great reason to doubt the *bona-fides* of your client's intentions due to the fact that since leaving us his affairs have not progressed satisfactorily and we believe the company he founded is not sound financially." Counsel said that Mr. Chadburn did not now say that that allegation was true.

Mr. Jowitt, K.C., for the defendants, said that the litigation was between two friendly trade rivals. If in the pamphlets or the letter words had been used that threw doubt upon the integrity, honour and good faith of Mr. Empson or the plaintiff company the defendants would at once withdraw them. A juror was then withdrawn and the case concluded.

Russell v. Schiskha.

In the Mayor's and City of London Court on March 5th, Mr. L. C. Russell, Holborn Viaduct, manufacturers' agent, sued Mrs. E. Schiskha, Brondesbury, for £26 10s. balance of an account for goods supplied. The plaintiff stated that he supplied two electroliers and other fittings to the defendant. One of the electroliers was damaged and he arranged to have it repaired. He denied that, as defendant alleged, he had promised to bear the cost of the repairs. The defendant's husband, giving evidence, averred that the plaintiff had undertaken to defray the cost of the repairs.

Judge Shewell Cooper accepted the plaintiff's evidence and gave him judgment for the amount claimed, with costs.

Porn v. Chandos Court Mansions, Ltd.

In the Mayor's and City of London Court, on February 26th, before Deputy Judge Hinde, Mr. M. Porn sued the defendants for damages for breach of contract. Counsel for the plaintiff said that his client received an order for two lifts, which were to be installed by a given date. Owing to delay in building operations the plaintiff was unable to do that. By the contract he was to receive an order for a further two lifts within a period of eight months. By that time, however, the cost of labour and material had so increased as to preclude the plaintiff's obtaining any profit, and he alleged that an agreement for a higher price was obtained from a Mr. G. Ravenshore, acting for the defendants. Mr. Ravenshore later denied having entered into that arrangement, and the order was never placed. In the meantime there was an amount due for the original lifts, which was included in the present claim.
